Max Stephan, born in Germany, and a naturalized citizen of the U.S., was found guilty of the crime of treason and on Nov. 13, 1942, was sentenced to hang. Later this sentence was commuted to life imprisonment.

A summary of the accomplishments for the fiscal year ending June 30, 1943, reflected 10,294 convictions with sentences totalling 24,624 years, 3 months and 6 days, 3

life and 7 death sentences. There were 8,367 fugitives identified and located by special agents of the FBI. A total of 11,976 fugitives were located for state, county and municipal law enforcement agencies through the facilities of the FBI identification division.

Although the year 1944 brought with it a great turn in the tide of battle, the FBI's internal security program continued to be pursued with undiminished relentlessness to prevent any last minute sabotage efforts on the part of the axis. Espionage efforts were also rendered ineffective

On Sept. 28, 1943, in New York city, two men received prison terms of 30 years each on charges of conspiring to violate the espionage statutes. The activities of these individuals came to light when letters written by one of them and mailed to "mail drops" known to be used by German espionage agents operating in the U.S. were intercepted. The letters were typewritten in English; however, the reverse side of each letter contained secret messages handprinted in the German language. The information in these secret messages would have been of great value to the axis since they were concerned with ship, convoy and troop movements in the New York area and the German submarine campaign in the Atlantic was extremely active at that time.

In Detroit, Mich., a ring of German espionage agents was arrested and prosecuted. On March 16 and March 20, 1944, sentences ranging from 5 to 20 years were imposed upon the defendants in this case. These agents were expected to obtain data in the U.S. on the location of munition factories, their production and personnel; location, number and type of aircraft factories; location of military camps and naval bases, and number of personnel stationed at these camps and bases; completion and departure dates of convoys; dates and destination of troop movements; information on medical supplies for export; new discoveries which might influence the progress of the war and information on helium. The leader of the ring was not permitted to make any notes by her German instructors but was required to commit to memory the matters desired by her principals.

Three Japanese women citizens of the U.S. were sentenced to prison terms in Denver, Colo., on Aug. 11, 1944, on charges of conspiracy to commit treason by giving aid to German prisoners of war.

As was the case during the entire wartime period, investigations pertaining directly to the security program received primary consideration, yet at the same time full and continuous attention was afforded the criminal violations coming within the jurisdiction of the FBI. In this field during this fiscal period certain crimes, particularly those aggravated by wartime conditions, reflected a sharp increase with some indications of a return to gangsterism. In New York city five men bound and gagged two truck drivers and hijacked whisky and trucks worth \$100,000. All five were arrested by special agents of the FBI. Prosecution resulted in substantial sentences being meted out to each man. In Monticello, N.Y., a man commonly referred to as the "trigger man" for the infamous organization known as "Murder, Incorporated," was sentenced to serve from 25 years to life at hard labour. Widespread investigation looking toward his apprehension had been conducted over a period of several years throughout the U.S. There were 13,616 convictions with sentences of 33,615 years, 2 months and 11 days and 4 life sentences recorded in the 1944 fiscal year. Fourteen thousand, six

hundred ninety-five federal fugitives were located and 13,729 fugitives were located for county, state and municipal law enforcement agencies when their fingerprints were searched through the files of the FBI identification division. Fines, savings and recoveries amounted to \$21,490,203.91.

The 1945 fiscal year brought with it a final attempt on the part of the German intelligence service to secure information in the U.S. through an espionage mission. On Dec. 3, 1944, a ship exploded off the coast of Maine. Since the explosion could have been the result of submarine activity in this vicinity, a very thorough inquiry was instituted by the FBI on the possibility that axis agents might have been landed by the same submarine. Numerous residents in the vicinity were interrogated by special agents. Two of the persons questioned on Dec. 4, 1944, advised that they had seen two strangers in the vicinity on the evening of Nov. 29, 1944. These two strangers proved to be espionage agents who had been landed by submarine on an espionage mission for the German intelligence service. Both were apprehended and were sentenced to death; subsequently, this sentence was commuted to life imprisonment. During this fiscal period 500 cases coming within the purview of the sedition statute were received and investigated, 3,081 suspected acts of sabotage were reported, 5,090 Selective Training and Service act fugitives were taken into custody, and 1,607 escaped prisoners of war were reported to the FBI.

Rise in All Types of Major Crime.—Meanwhile the criminal incidents in the U.S. continued on the upswing. In 1943 there were an estimated 1,381,681 major crimes committed; in 1944 an estimated 1,393,655; and in 1945 an estimated 1,565,541. In 1945 each offense class rose above previous years. Robberies were up 23.6%; auto thefts, 18.7%; burglaries, 17%; negligent manslaughters, 16.2%; and murders, 10.1%. Aggravated assaults rose 8.7% and an 8.6% rise was recorded for larcenies. Rape increased 5.7%.

In Wyoming a 69-year-old retired farmer was kidnapped and his truck was stolen. The owner was forced out of the truck in Denver, Colo. His abductors were arrested in Salina, Kan., and upon conviction were sentenced to serve 15 years each in a federal penitentiary. In Prairie City, Ore., \$1,600 was taken from the Grand County bank. Eleven days later the perpetrator of this crime was killed by special agents and a deputy sheriff in a remote area of the state of Utah.

In Florida and Missouri a black market in railroad tickets was broken up and the operators were fined and sentenced to jail. A man who used more than 55 aliases and cashed more than \$100,000 in bogus checks throughout 28 states was apprehended in Seattle, Wash.

For the 1945 fiscal year, 13,813 convictions were recorded in cases investigated by the FBI with sentences totalling 31,962 years, 4 months and 6 days, 1 death sentence and 6 life sentences. Fines, savings and recoveries amounted to \$16,534,436.21, a total of 8,955 fugitives were located, and 7,892 automobiles were recovered in cases investigated by the FBI.

At the end of the 1946 fiscal year there were 101,578,578 sets of fingerprints on record at the FBI identification division. During the year the FBI laboratory conducted 67,229 examinations involving 104,780 specimens of evidence. With the classes graduating during the year, the roster of National academy graduates reached a total of 1,381. Among these officers were representatives of every

state in the union and in addition the Panama Canal Zone, Alaska, Puerto Rico, China, the Philippine Islands, England, Canada and Newfoundland.

Sentences meted out in the 11,873 convictions during the 1946 fiscal year totalled 26,624 years, 6 months and 13 days and in addition 5 life sentences. Fines imposed amounted to \$1,449,668 and savings and recoveries reached \$67,035,267. There were 10,990 fugitives located and 11,458 automobiles recovered in cases investigated by the FBI.

Federal Communications Commission

The decade 1937–46 offered a particular challenge to man's imagination and inventiveness in the field of communications. It demonstrated that the age of miracles was not over as far as electronic developments were concerned. Frontiers were pushed back farther than was thought possible at the beginning of the decade and new services, then undreamed of, became a reality.

Nearly four years of war necessarily retarded normal expansion of electrical communication services in the United States but, at the same time, it produced new apparatus and techniques for military purposes. With the national emergency ended, these found invaluable peacetime application, particularly in radio. Opening of new reaches in the spectrum not only provided more room for the many classes of transmission but offered an opportunity for wire services to utilize radio in the modernization of the older forms of communication.

In 1937 the Federal Communications commission, then only three years old, was trying to find places on the lower frequencies for a rapidly increasing number of program broadcast stations, besides regulating telephone, telegraph, radio and cable common carriers engaged in interstate and foreign communication. In 1946 it was regulating and fostering the growth of FM (frequency modulation) and television broadcasting, facsimile, aviation, amateur and a host of new or prospective radio services.

Radio Spectrum.—In 1937 radio was able to use only a small part of the radio spectrum. Before World War II, this active portion extended from 10 kilocycles to 300 megacycles (a megacycle is 1,000 kilocycles). The usable portion of the spectrum became so crowded that it could not accommodate all services. But developments were such that, in 1945, it was found possible to extend the potential radio "ladder" to 30,000 megacycles. This made room for new services as well as expansion of the old. Even so, parts of the spectrum again were becoming so congested that, until apparatus was available to make use of even higher frequencies, space had to be shared where it was possible to do so.

Standard Broadcast.—In 1937 there were about 700 standard broadcast stations; in 1946 the number approached 1,000, not including 300 whose construction had been authorized but which were not yet on the air. At the beginning of 1946 about 56,000,000 receivers were in use. The so-called antimonopoly rules were promulgated by the commission in 1941 after three years of inquiry into network practices and, in 1943, were sustained by the

supreme court. These rules, in general, were designed to foster competition in broadcasting and give the individual stations greater freedom in program selection. The sale by RCA of the Blue Network under these provisions added a fourth independent network. As a further curb to monopoly growth, a rule adopted in 1943 limited ownership by one interest to one station in a locality. A survey of broadcast programs and advertising caused the commission, in 1946, to conclude: "Primary responsibility for the American system of broadcasting rests with the licensees of broadcast stations, including the network organizations. It is up to the stations and networks rather than to federal regulations that listeners must primarily turn to for improved standards of program service." However, in reiterating its responsibility to the public, the commission served notice that it would be more exacting in reviewing over-all performance of stations in the light of promises made in their original applications. An orderly shift of standard broadcast frequency assignments under the North American Regional Broadcasting agreement, effected in 1941 and supplemented by an interim agreement in 1946, reduced mutual interference from stations operating in Canada, Cuba, Mexico, the United States and some other adjacent countries. Reallocation proposals in 1945 would add the 540 kilocycle channel to the standard broadcast band of 550-1,600 kilocycles. Re-examination, begun in 1945, of "clear channel" (wide coverage) stations revealed that 381/2% of the country with more than 10,000,000 people still received no satisfactory daytime broadcast service and that 21,000,000 people in 57% of the country got no primary service at night.

International Broadcast.—Under international agreement, high frequency bands were allocated for overseas broadcasts. Commercial programs for international broadcast stations located in the United States were authorized in 1939. After 1937 the number of these domestic stations increased from 12 to 37. International broadcast stations were highly useful in the war effort by carrying information on U.S. war aims and military progress to the axisoccupied nations, Allied and neutral nations, and by giving U.S. troops up-to-the-minute news of their homeland.

Educational Broadcast.—Educational institutions were among the earliest licensees of standard broadcast stations. By 1925 their number had reached 171, but a decade later only 31 remained in that field. In 1938 a high frequency band was reserved for noncommercial educational use and, 7 years later, 20 FM channels were allocated for expansion of this type of service. In 1946, 6 noncommercial educational stations were in operation and 20 more had construction permits.

FM.-Frequency modulation of the wide-band type had greater tonal range and was more immune to interference than standard broadcast (amplitude modulation). For that reason it was better able to use higher frequencies. Released for experimentation in 1939, channels for FM broadcast were opened to commercial service in 1941. At that time the commission took note of the large number of FM and AM applicants associated with newspapers and conducted hearings, the results of which were reported to congress in 1944. In 1945, after extensive study, FM was assigned a higher and better position in the spectrum. "Public interest," said the commission at that time, "requires that FM be established in a permanent place in the radio spectrum before a considerable investment is made by the listening public in receiving sets and by the broadcasters in transmitting equipment." Of about 65 FM stations operating in 1946, only 5 were on the old band exclusively. Construction of more than 500 new stations

had been authorized. In 1946, one out of every five FM channels allocated to large cities was reserved for future assignment. Channel apportionment was premised upon equitable distribution of service.

Television.-Visual broadcasting saw 17 experimental stations operating in 1937. Two years later, high-frequency bands were set apart for this projected service. Because of engineering and other problems, extensive commissionindustry inquiry was conducted throughout 1939 and 1940 with the result that conflicting systems were reconciled to permit reception on standard receivers, and commercial television was given the green light in 1941. Six commercial stations were licensed before the war stopped further construction. Later, 24 additional stations were authorized by the commission. Some 7,000 television receivers were estimated to be in use at the start of 1946, with contemplated production of more than 100,000 before the end of that year. In 1946, 13 channels between 44 and 216 megacycles were assigned for commercial television, and space was allocated in the 480-920 megacycle band for experimentation with colour pictures. Before the war, it appeared that television would be a purely local affair, since its initial projection was limited to places in the line of sight of the transmitting antenna. However, extension of the coaxial cable system and new radio-relay devices promised to carry programs far from their place of origin. A network televised program on Lincoln's birthday in 1946 was made possible by completion of the New York-Washington section of the coaxial cable. There was also the possibility that television, as well as facsimile, might be combined with telephony so that parties to telephone conversations could see as well as hear each other.

Facsimile.—Facsimile communication had been employed by common carriers, such as the telegraph, for many years. Tests for transmitting still pictures over standard broadcast facilities were authorized in 1937. Though facsimile broadcast was still experimental, the commission by 1946 permitted it to use the regular FM channels as well as a special band in seeking to develop a new and economical means of speeding script, printed matter and pictures through space. Facsimile had particular news service possibilities, and even in 1946 it was experimentally possible to connect it with the telephone so that a caller, failing to receive an answer, could leave a message. Wide use for facsimile was foreseen in the telegraph industry and in police radiocommunication.

Amateurs.—The self-styled "hams" were of inestimable value in advancing radio and rendering emergency service in war and peace. Even in 1937 this pioneer fraternity had nearly 37,000 active members. Their number in 1946 approached 80,000. As was the case in World War I, amateur operation ceased during World War II but many "hams" continued to function in the defense forces. Beginning in late 1945, relinquishment of frequencies by the military permitted amateurs gradually to regain their former channels until, by mid-1946, they had most of their prewar band, with some additions. A new system of amateur call letters made full use of the prefix K (as well as W) and permitted thousands of additional assignments without exceeding five symbols.

Aircraft and Ships.—The end of World War II brought a flood of radio applications from a new aviation-conscious public. Since life and property were at stake, the commission provided needed channels and simplified and speeded the licensing procedure. In ten years the number of aviation stations grew from slightly more than 700 air-

craft and about 500 land stations to 7,000 and 1,500 respectively. Radio authorizations for normal shipboard use exceeded 8,000.

Police, Fire and Forestry.—In the emergency services, the importance of police communication was shown in the fact that in 1946 the approximately 3,000 police networks was double the number in 1937. Frequencies were increased to provide for future transmission of photographs and fingerprints. Fire departments, which formerly shared police radio systems, were assigned channels of their own. Though there were only 27 fire radio systems in 1946, nearly 100 cities of more than 100,000 population indicated intention to add radio to their fire systems. The number of forestry radio stations had increased to more than 600 since this service was established in 1939.

New Services.—Railroad safety was furthered by a special train communication service, inaugurated in 1945. The following year saw establishment of stations in the public services for electric, gas and water companies and petroleum pipe lines. Bands were assigned for industrial and medical radio equipment to help prevent interference from diathermy and like apparatus.

Experimental Stations.—There were more than 1,000 experimental radio stations in 1946. A mobile service, opened to experimentation in that year, offered aid to dispatching and controlling the movement of ambulances, doctors' cars, passenger buses, taxicabs, delivery and repair trucks and boats. In addition, telephone companies were conducting experiments in many municipalities on linking radio calls from public vehicles to the wire systems, so that a passenger might be able to put in a paid call from a moving train, bus, boat or plane. The first such experimental call made overseas occurred on July 16, 1946, when an auto passenger phoned from St. Louis to Honolulu. War popularity of the "walkie-talkie" resulted in plans for a citizens' radio communication service to accommodate the use of portable apparatus by individuals at home, work or play. The benefits of short-range radio communication in large industrial plants, on farms and ranches, and in mountain areas were obvious.

Telephone.—In 1936, it cost \$8.50 for a three-minute day station-to-station U.S. telephone call from coast-tocoast; in 1946 it cost \$2.50. Periodic reductions in U.S. toll rates during the decade 1937-46 aggregated more than \$100,000,000 annually, based on the volume of business at the time such reductions were made, but exceeded \$200,-000,000 annually on the basis of business volume in 1946. Interstate toll rates became uniform. More than 30,000,000 telephones were in use in 1946, and more than 1,500,000,ooo toll calls were being handled annually. In 10 years, local calls had increased 40% and toll calls more than 100%. However, three out of every five farm homes remained without telephone service. Between 1920 and 1940 the number of farm telephones decreased 39%, although electrified farms showed a 34% increase. Provision was made for using radiotelephone transmission to help bring telephone service to isolated communities. Developments in radiotelephony forecast extending common carrier service to vehicles on land, sea and in the air. In 1945 there were three point-to-point radiotelephone stations giving domestic service. In the same year the U.S. supreme court upheld the Federal Communications commission's action in enjoining hotels from collecting surcharges on toll calls. The commission proposed, in 1946, that recording devices be sanctioned as regular telephone equipment under conditions which would assure knowledge to parties engaged

in telephone conversation that these appliances were employed.

Wartime restrictions on public overseas radiotelephoning were lifted in 1945. In ten years the cost of a telephone call from New York to London had been cut from \$75 to \$12. Thirteen public point-to-point stations afforded contact with 39 foreign places.

Telegraph.—The merger of Postal Telegraph with Western Union, effected in 1943 for economic reasons, permitted elimination of many duplicate facilities, including nearly 2,000 offices. In 1946 the commission granted Western Union a general 10% rate increase but ordered an investigation of that company's financial situation. Meanwhile, the new unified telegraph system was being modernized by installation of FM radio-beamed channels between busy centres, changing from manual to mechanical (reperforator) switching systems at major relay points, and utilizing telefax (facsimile) to pick up and deliver messages where volume of business warranted. Use of the radio telegraph beam was expected to eliminate costly wire lines as well as interruptions to service caused by storms and electrical disturbances.

In 1943 congress deferred a proposal to unify U.S. overseas radiotelegraph and cable carriers. For years the commission had been seeking parity and uniformity in international rates. In 1945 rates to Europe, Central and South America, the West Indies and the Philippines were reduced to a uniform pattern, followed a year later by rates to other foreign countries. Commission activities after 1940 made it possible to open many new circuits, including direct contacts with various British empire points. In 1946 the FCC undertook review of overseas radiotelegraph service preparatory to formulating a policy for future development. The United States in 1946 had radiotelegraph communication with about 70 foreign points.

Cables.—This oldest means of international electrical communication had remained practically static in mileage for many years. The 120,000 mi. of U.S. ocean cable lost some circuits temporarily during World War II. The United States controlled about 32% of the world's cables and Great Britain about 58% in 1946.

National Defense.—National defense aspects of electrical communication had been stressed in the Communications act of 1934. In 1940 the president created a special Defense Communications board (which later became the Board of War Communications) to co-ordinate defense communications activities. The FCC established a Foreign Broadcast Intelligence service which monitored foreign broadcasts during the war, while its own Radio Intelligence division policed the domestic ether. With listening stations at Guam, Kauai, Portland (Oregon) and Silver Hill (Maryland), the F.B.I.S. analyzed 2,500,000 words of daily overseas broadcast and speeded reports to 25 military and other government agencies. In the home sector, the R.I.D. guarded against axis transmission and helped furnish bearings on U.S. aircrast. The F.B.I.S. was absorbed by the war department in 1945 but the R.I.D. continued to monitor the ether for illegal transmission and to protect against interference. (See also RADIO; TELEG-RAPHY; TELEPHONE; TELEVISION.) (C. R. D.)

Federal Council of the Churches of Christ in America

Organized in 1908 to express the essential oneness of the Churches of Christ in America and to unify effort, the council by 1946 represented 25 denominations with about 28,000,000 members and 140,000 congregations. One small body, the Reformed Episcopal, withdrew during the

decade 1937-46, while the Presbyterian Church U.S. (by 1e-admission), the Protestant Episcopal, the Church of the Brethren and three Eastern Orthodox Churches—the Syrian, Ukrainian and Russian—joined the council.

Because of reorganization late in the previous decade, the council operated more strictly and directly under the control of the member bodies than formerly. Secondary representation of its autonomous but affiliated state and local councils was provided by the appointment of nominees of these agencies by their respective denominations.

The council experienced extraordinary institutional growth during the decade. Its budget increased nearly threefold, reaching \$675,000 in 1945. Permanent assets, still only about \$400,000, increased three and one-half times. Departments and separately staffed commissions and committees increased in number by two and one-half times. Parallel growth of an autonomous but closely interrelated system of state and local councils both in numbers, resources and activities matched that of the national body itself.

The basic concerns of the church which had continuous recognition from the council's beginning were steadily fostered. Evangelism had major stress through a continuous series of preaching missions during the decade covering most of the major and secondary cities of the United States, and more specialized religious campaigns on university campuses, for teachers and for ministers, as well as in military establishments and in war industrial communities. Christian social relations were magnified through educational and service activities in the fields of industry, family life and relations with social agencies. The department of research and education conducted influential investigations, especially in political and economic fields from the Christian standpoint. Racial tensions, aggravated by the movements of population and the spreading unrest of the war period, were interpreted especially by race relations clinics in numerous cities where first-hand local conditions were brought under the review of responsible citizens. The department of religious radio operated on a greatly expanded scale as the chief agent of Protestantism in its field. In 1945 it conducted 578 produced or sponsored programs.

The war crisis which dominated the decade, both in its earlier stages and during the period of hostilities and the postwar period, magnified the functions of the department of international justice and good will. Its more aggressive activities were carried on through a special commission on the bases of a just and durable peace, which conducted a series of exceedingly influential nation-wide conferences on the various phases of the war; was directly concerned with the modification at many points of the Dumbarton Oaks proposals and their inclusion in the charter of the United Nations; and in the summer of 1946 convened in Cambridge, England, the first international postwar church conference on peace and reconstruction at the request of the World Council of Churches. The chairman of the commission, John Foster Dulles, was one of the leading advisers on U.S. foreign policy during much of this period.

Special wartime activities of the Federal Council included greatly augmented attention to the army and navy chaplains, co-ordination of services in camp and defense communities and to service in directing the resettlement of Japanese evacuated from their homes during the war; also to co-operative work for aliens and prisoners of war; and enterprises of overseas relief. The interests of conscientious objectors and the returning service men were also matters of specific organization and effort. The ma-

chinery of service in these fields began to be demobilized after the cessation of hostilities, and the responsibility for these interests was taken over by other departments. Thus, returning service men were being organized as the young laymen of the churches, whose permanent place as civilians in Christian life and organization was a matter of intense emphasis.

During the decade, new departments of work were developed, including Public Relations, the rapidly expanding department of religion and health, a committee on the church and economic co-operative movements and a commission on the ministry, whose first concern was to find recruits for the ranks of the local pastorate, greatly depleted by war.

A Washington office was opened to furnish information as to legislative issues involving the institutional or moral concern of the church, and a research agency jointly maintained with the Home Missions council was increasingly useful in putting the results of first-hand investigation at the service of communities and local councils in the guidance of their programs. More members of its staff and of the local councils had adequate technical preparation in the lines of their specialization. A group of occumenical fellowships was provided by the generosity of the Julius Rosenwald fund to provide advanced training and internship in preparation for council secretaryships, both national and local.

In its reaction to the unprecedented needs of the decade, the Federal Council functioned as "the voice of the Protestant Church." It faithfully reflected the changing currents of Protestant thinking during the period. It maintained the independence of the church and its duty of criticising the world of politics and economics in the light of the Christian conscience. The council itself, however, shifted its grounds in important respects. Its earlier pacifistic resolutions with respect to war gave way to the regretful conclusion, after long examination of specific war issues, that it was the duty of the church, since war was an actuality, to support the Allied cause, especially in view of the fact that the ultimate Christian principles and the welfare and very existence of churches in many countries were at stake. In reaching this conclusion, as in all its other major thought processes, the council reflected two convictions which would not have been made central in earlier decades. The first was a return to a profounder dependence on theology. Thus, the examination of war issues was made by a commission of 26 Christian scholars which reported in 1944. The second emphasis was on the centrality of the church, the conviction that it was an actual world society, the maintenance and purification of whose own life were the crucial point of its responsibilities for the guidance of civilization in crises of human affairs. Consequently the council spoke for the U.S. churches in a wide range of temporal problems, such as the use of atomic energy.

An important phase of the council's influence was exerted through its publications and literature. Its monthly Bulletin and bi-monthly Information Service recognized as authoritative in the records of the church's current life and its relationships to public affairs. The many departments continued to issue and circulate a vast number of pamphlets, and several council secretaries made permanent contributions to the literature of their respective fields, among them Walter W. Van Kirk, F. Ernest Johnson, B. Y. Landis, Henry Smith Leiper, Seward Hiltner, James Myers and John Fortson.

The actions of the Federal Council often were joint actions of two or more national interchurch agencies. Representatives of these more specialized organs of the church's co-operative life sat on the Federal Council committees, and the majority of the major reports and projects of the decade were the results of joint sponsorship and action. All major field activities were cleared through the intercouncil field department. A plan was launched in 1942 for uniting the Federal Council and seven other major interchurch agencies of this more specialized sort. The plan was referred to the agencies and their constituent denominations, whose favourable action seemed to assure that at least the Federal Council, the Home Missions council and the International Council of Religious Education would be merged in a still more inclusive council, representative of a fuller program of united activity as well as a larger number of denominations.

A few important denominations remained outside of Federal Council membership through fear of centralization or on account of doctrinal conservatism. Two rival councils aspiring to be national in scope appeared during the decade.

Meanwhile the council came into the closest organizational and working relations with the evolving World Council of Churches. Its department of relations with churches abroad had long been a tie with one of the major streams of world Christianity, absorbed in the World Council. Without becoming the constitutional organ of the World Council (as had the British Council of Churches) the Federal Council enlarged the scope of its world relationships through the appointment of a World Council secretary as its occumenical secretary and by sharing in the postwar rehabilitation and relief activities of the World Council. Its executive secretary, Samuel McCrea Cavert, made three extended European trips and was loaned for six months to the Geneva office of the World Council to help set up its expanded program. The final technical relations of the Federal Council and the World Council remained to be determined after the Federal Council's probable merger with the other U.S. interchurch agencies. Leadership of the council during the decade was in the hands of the following distinguished presidents: Rev. Edward DeWitt Jones, pastor of the Central-Woodward Christian church, Detroit, 1936-38; Rev. George A. Buttrick, pastor of the Madison Avenue Presbyterian church, New York city, 1938-40; Dr. Luther A. Weigle, dean of Yale Divinity school, 1940-42; the Rt. Rev. Henry St. George Tucker, presiding bishop of the Protestant Episcopal Church in the United States 1942-44 and Rev. G. Bromley Oxnam, bishop of the Methodist Church, 1944-46. Executive leadership continued throughout the period in the hands of the general secretary, Dr. Samuel McCrea Cavert. (H. P. D.)

Federal Crop Insurance Corporation See AGRICULTURE.

Federal Deposit Insurance Corporation

During the years 1937–46 the potential liabilities of the FDIC increased rapidly while the number of banks requiring the aid of the corporation declined steadily. Deposits of insured commercial and mutual savings banks rose from \$48,000,000,000 in 1937 to more than \$152,000,000,000 in 1946, more than a threefold increase. While the percent of deposits covered by the \$5,000 insurance maximum increased slightly from 44% to 46%, the

amount of deposits covered by this maximum increased from \$21,000,000,000 to \$69,000,000,000.

Periodically, the corporation continued to make special calls upon all insured banks to obtain an estimate of the amount of its liability as an insurer of bank deposits. The insurance protection given depositors in insured banks on these special call dates is shown in Table I.

Table 1.—Insurance Protection with a Maximum Coverage of \$5,000 in Insured Banks—Special Call Dates, 1936-45

		Accounts	Deposits			
Number Date of call of banks		Percent of Total \$5,000 or number less	Amount Per- (in millions) cent Total Insured insured			
May 13, 1936 Sept. 21, 1938 Sept. 24, 1941 Oct. 10, 1945	13,754 13,487	58,785,000 98.4 62,731,000 98.3 69,495,000 98.1 92,333,000 96.4	\$46,168 \$20,456 44 49,224 22,610 45 69,566 27,639 39 140,603 65,859 46			

During this ten-year period, the corporation paid depositors in 170 insured banks which were placed in receivership. Disbursements in this connection amounted to \$72,000,000. Moreover, during this same period the corporation made extensive use of another method of protecting bank depositors from loss. Under this latter procedure, the corporation made advances of \$165,000,000 to facilitate the mergers of 126 weak insured banks with strong institutions. This power could be used only when such action reduced the risk or averted a threatened loss to the corporation. In such cases there was no interruption of banking service, and all depositors were fully protected against loss. It was estimated that only about 1,800 of the more than 1,100,000 depositors in both the receiverships and mergers would suffer any loss, and their loss would amount to less than \$2,000,000. Table II shows the number and deposits of the banks which received financial aid under both methods and the amount of the FDIC disbursement for each year of the period.

Table II.—Number and Deposits of and FDIC Disbursements to Insured Banks Which Were Placed in Receivership or Merged with Financial Aid of FDIC, 1937–46

Year	Number of banks	Total deposits (in thousands)	FDIC disbursement (in thousands)
Total, 1937-1946	296	\$462,430	\$237,319
1937	75	33,345	19,203
1938	74	59,722	30,479
1939	60	157,781	67,793
1940	43	142,390	74,352
1941	15	29,721	23,880
1942	20	19,010	10,910
1943	5	12,535	7,171
1944	2	1,915	1,498
1945	1	5,695	1,768
1946	1	316	265

The procedure of making advances to facilitate a merger proved to be desirable both from the point of view of the corporation and from that of the depositors and communities involved. As a result, the corporation made greater use of its power to effect mergers of insured banks in difficulties and less often paid depositors in closed banks. Since all deposits were protected in banks which were merged, the figure for total deposits could be more significant as a measure of the corporation's potential liability than that for insured deposits. On June 30, 1946, total deposits amounted to \$152,000,000,000,000, while it was estimated that insured deposits on that date amounted to \$69,000,000,000.

Throughout the decade 1937–46, more than 90% of all commercial banks in the United States were insured by the FDIC; these banks held more than 95% of total deposits in all commercial banks. Deposits in insured banks increased from \$48,000,000,000 on June 30, 1937, to \$148,000,000,000 at the end of 1945. On June 30, 1946, deposits decreased to \$141,000,000,000, resulting from a decline in deposits of the U.S. government. During this same period there was a marked increase in both the number and deposits of insured mutual savings banks.

In 1937, only 56 such banks with total deposits of \$1,000,000,000 were insured. This represented about 10% of both the number and deposits of all mutual savings banks in the United States By 1946, there were 191 insured mutuals with deposits on June 30 of \$11,000,000,000, comprising slightly more than one-third of the number of all mutual savings banks and about two-thirds of their deposits. Table III shows the number and deposits of insured commercial and mutual savings banks during the years, 1937–46.

Table III —Number and Deposits of Insured Commercial Banks and Insured Mutual Savings Banks June 30, 1937–46

		Insured con	nmercial banks	insured mutual	savings banks

1945.		13,282	134,282	192	9,671
1946		13,335	140,649	191	10.979

Accompanying the growth in deposits was a growth in the assets of insured commercial banks, from \$56,000,000 000 at the beginning of 1937 to \$158,000,000,000 at the end of 1945. From 1937 to 1941, the growth in bank assets was fairly slow and regular, reflecting the economic recovery from the depression of the early 1930s Then, as a result of the war in Europe, U.S. defense activities, and finally U.S. participation in the war, the rate of increase was greatly accelerated. By June 1943, assets had increased to \$102,000,000,000, and they continued climbing until the end of 1945. Increased holdings of US government obligations accounted for almost three fourths of this increase. In 1946, however, holdings of U.S. government securities finally started to decline Loans and discounts grew from \$16,000,000,000 in 1937 to \$27,000,000,000 on June 30, 1946, and were expected to continue to increase as business expanded.

The period was one of favourable earnings Total operating earnings and expenses of insured commercial banks both increased, amounting to approximately \$2,500,000 and \$1,500,000 respectively in 1945 as compared with \$1,600,000 and \$1,100,000 in 1936. While net profits available for stockholders increased from \$524,000,000 to \$906,000,000, the amount of cash dividends declared and interest paid on capital changed slightly—\$274,000,000 as against \$223,000,000 During this period of high earnings, banks built up their surplus accounts. However, their assets increased more rapidly than their capital accounts, resulting in a decrease in the ratio of capital to total assets from 11 3% in 1937 to 6 0% on June 30, 1946.

During this period of prosperity the FDIC likewise built up its surplus, although not so rapidly as deposits in insured banks increased. Most of the income of the corporation continued to consist of assessments paid by insured banks at the annual rate of one-twelfth of 1% of their total deposits. The amount of these assessments increased from \$39,000,000 in 1937 to \$94,000,000 in 1945. Total income of the corporation during its entire period of operation from Jan 1, 1934, to June 30, 1946, amounted to \$777,000,000, consisting of \$616,000,000 from assessments and \$161,000,000 from investments and other in come. Total expenses during the period amounted to \$73,000,000, of which \$30,000,000 were net deposit in surance losses and expenses and \$43,000,000 were ad ministrative expenses and other charges.

Total capital of the corporation consisted of \$289,000, 000 of capital stock issued at its organization and \$704,

ooo,ooo accumulated surplus. By the end of 1946, surplus was expected to amount to more than \$750,000,000, which would provide a total capital and surplus in excess of \$1,000,000,000. It was highly desirable that the corporation build up this surplus during times of high bank earnings so that it would have a fund sufficient to meet any de mands if serious banking difficulties should recur. The corporation suggested that the \$289,000,000 of capital be repaid over the succeeding few years without, however, reducing the corporation's capital account below \$1,000,000,000. Repayment of this original capital would make the deposit insurance fund a mutual fund entirely sus tained by contributions made by the banks.

By executive order of the president, No 9148, of April 27, 1942, all of the functions, powers and duties of the Farm Credit administration and of the governor thereof under the Federal Credit Union act of June 26 1934 as amended, were transferred to the Federal Deposit In surance corporation. Credit unions—co operative associations organized to encourage thrift among their members and to provide a limited source of credit for productive purposes—were chartered and examined by the corporation. Their shares, however, were not insured

On Jan 5, 1946, Maple T. Harl became chairman of the board of directors, succeeding Leo T Crowley who, after 12 years of service, resigned effective Oct. 15, 1945. Phillips Lee Goldsborough served as a member of the board of directors from April 29, 1935, until his death on Oct 22, 1946. The resulting vacancy on the board had not been filled by the end of 1946 On Oct 24 1938, Preston Delano was appointed comptroller of the currency and became ex officio member of the board of directors, succeeding J F. T O'Connor who resigned as comptroller of the currency, effective April 17, 1938.

Federal Power Commission

Strengthened by the passage of the Federal Power act of 1935, which extended its authority over utilities en gaged in the interstate transmission and sale of electric energy, the Federal Power commission began the task of reducing inflated capitalization, ending interlocking directorates and freeing operating subsidiaries from burdens imposed by holding companies and promoter "parents."

More than \$1,000,000,000 of write-ups, excess costs and charges were eliminated from electric utilities' plant accounts by "original cost accounting," based on the original cost of properties to the parties first devoting them to public service.

Rate regulation was simplified and expedited by supreme court decisions in the Hope Natural Gas company and other cases, upholding the commission's use of original cost and prudent investment in determining rate bases. Regulatory agencies, state and federal, were freed from the old *Smith* v. *Ames* reproduction-cost requirement by the court's affirmation that in rate making commissions need not be bound by any fixed formula.

Consumers saved hundreds of millions of dollars by rate reductions in every state and section. During the tenyear period 1935 through 1945, when the use of electric energy increased nearly 120%, residential rates declined approximately 20%, commercial rates slightly more than 15%, and industrial rates nearly 10%. Reduced rates and increased use resulted in an approximate 30% decrease in the over-all average cost per kilowatt-hour. All but two cities of 50,000 or more population had reductions in residential bills.

Electric energy produced for public use increased from 109,316,033,000 kw.hr. in 1936 to 212,895,000,000 in the 12 months ending June 30, 1946. Nonutility (principally industrial) production rose to 45,448,863,000, making total U.S. power production 258,343,692,000 kw.hr. War demands brought an all-time peak of 279,524,691,000 kw.hr. in 1944, of which 228,188,844,000 kw.hr. was for public use. Generating capacity (installed) in utility service increased in 10 years from 35,081,569 to 50,160,191 kw.; nonutility from about 10,000,000 to 12,765,744, making the total U.S. generating capacity 62,925,935 kw.

When the Natural Gas act, passed by congress in 1938, entrusted to the commission the regulation of the transportation and sale of natural gas in interstate commerce, states and cities appealed for lower gateway rates. Natural gas rate reductions within seven years had reached a cumulative total of \$118,548,000. Certificates of public convenience and necessity were granted authorizing the construction of thousands of miles of pipe lines, the longest, stretching 1,265 mi. from Texas to West Virginia, reaching a capacity of 300,000,000 cu.ft. per day.

Peacetime gas projects exceeded those of the war period. The 1,200 mi. pipe line from Texas to California authorized after the war was rivalled by numerous other applications before the commission. Large extensions were authorized to increase the gas supply of Chicago, Detroit, Kansas City, Cincinnati and other cities. More than \$100,000,000 was involved in projected lines to Michigan and Wisconsin.

After Feb. 7, 1942, when a Gas Act amendment conferred this authority, the commission issued certificates authorizing the construction and operation of 6,588 mi. of natural gas pipe lines and the installation of 301,905 compressor horsepower. In 1946, the commission completed the most comprehensive natural gas investigation ever made. At hearings in Kansas City, Oklahoma City, Houston, New Orleans, Biloxi, Miss., Chicago, Charleston, W.Va., and Washington, producers, pipe line operators, geologists, state officials, labour union leaders and other witnesses testified on every phase of the industry.

Water power developments were licensed, power possibilities of numerous flood control projects investigated and power markets studied. Following a survey of unlicensed

hydroelectric projects, several large plants were required to accept federal licences. Co-operating with the U.S. engineers, reclamation bureau and other agencies, and with the governors of states concerned, the commission, as a member of the Federal Inter-Agency Basin committee, joined in establishing inter-agency committees for the Columbia and Missouri river basins, and took an active part in preparing the plans for the vast multipurpose power, flood control, irrigation and navigation developments proposed for the postwar period. Federal Reserve System

The federal reserve system greatly expanded during the decade 1937–46 and clearly demonstrated its ability to serve the purpose for which it was created, by making easy the tremendous amount of financing necessary during World War II.

As an illustration of the way the system grew during the decade, the following summary is quoted from the 1945 annual report of the board of governors of the federal reserve system:

Membership in the Federal Reserve System increased in 1945, as it has in every year since 1939, and registered a net gain of seventy banks for the year. The number of national banks decreased by a net of eight while the number of state member banks increased by a net of seventy-eight. Eight of the ninety-five State banks admitted to membership were newly organized and eighty-seven were already in operation.

All but one of the eighty-seven had previously been admitted to membership in the Federal Deposit Insurance Corporation. Total deposits of these eighty-seven banks were about three hundred and seventy-eight million dollars. Over one-half of the State banks admitted to membership were located in three Federal Reserve districts—Cleveland, Chicago, and St. Louis.

The six thousand eight hundred and eighty-four member banks in operation at the end of 1945 accounted for forty-nire per cent of the number and eighty-six per cent of the deposits of all commercial banks in the country. These percentages compare with forty-four and eighty-six respectively at the end of 1939.

The State member banks of the Federal Reserve System acquanted for twenty-one per cent of the total number and sixtynine per cent of the deposits of all State commercial banks. The corresponding percentages were thirteen and sixty-eight respectively in December 1939.

Financing the War.—To aid the United States in World War II, the federal reserve system used its powers to assure an ample supply of funds. Close wartime co-operation between the treasury department and the federal reserve system made it possible to finance the most expensive war in history at low and stable rates of interest. A structure of interest rates on government securities conforming closely to the pattern prevailing at the beginning of the war was maintained. The rates on marketable securities ranged from $\frac{7}{8}\%$ on one-year treasury certificates to $\frac{21}{2}\%$ on the longest term treasury bonds.

Federal reserve purchases of securities provided the basis for the rapid growth of currency in circulation and also supplied the banks with additional reserves needed to support the expansion of bank credit and deposits. Under reserve requirements existing in 1946, each dollar of additional reserves permitted an expansion of more than six dollars in bank credit and bank deposits by the banking system as a whole.

Maintenance of interest rates at low levels served several purposes: it encouraged investors to purchase securities without waiting for higher yields and to hold them without fear of loss from price fluctuations; it kept the market free from disorderly movements and retarded the growth in bank earnings on securities purchased and finally, it held down the cost to the treasury of interest charges on the greatly expanded public debt. As a result of these measures and policies, the government experienced no difficulty at any time in raising the necessary funds. The average interest cost of the public debt to the treasury (and so, to the taxpayer) was less than 2%.

An executive order at the beginning of the war empowered the federal reserve banks to serve as authorized agencies for loans to be guaranteed by the war department, navy department and Maritime commission. Several thousand of these loans were handled during the emergency.

Record Money Circulation.—Wages rose tremendously during the decade, and with this increase the money in circulation rose from about \$6,500,000,000 in 1937 to more than \$28,500,000,000 in 1946. Never before in U.S. history had money in circulation reached such a huge total. One of the purposes of the setting up of the federal reserve system was to provide a means for expanding currency as the need arose. Of the \$28,500,000,000 of money in circulation, \$25,250,000,000 were federal reserve notes.

An analysis in Oct. 1946 of the denominations of currency in circulation disclosed a greater number than usual of large denomination currency. There were nearly \$2,500,000,000 in \$50 bills, and more than \$4,500,000,000 in \$1,000 bills; \$434,000,000 in \$5,000 bills; \$784,000,000 in \$1,000 bills.

Aid to Industrial Financing.—The system helped finance industry during the decade by making direct loans to individual corporations, by discounting notes originally taken by commercial banks and by making commitments to industry and to banks for large lines of credit which could be available at a moment's notice. Loans outstanding during the decade in any one week varied from \$1,000,000 to \$25,000,000, and commitments outstanding from \$1,500,000 to nearly \$21,000,000.

Rates on these industrial loans made direct to corporations varied from 2% to 5%. Rates on notes rediscounted by banks varied from 1% to 1½%. During the war years, the rates on commitments varied from ½% to 2%.

In the meantime, the federal reserve banks purchased tremendous quantities of government bonds, until the total in 1946 reached nearly \$23,500,000,000. When added to loans and discounts, the total federal reserve financing reached a high point in 1946 of \$24,314,000,000. This, of course, was in addition to the tremendous quantities of government bonds purchased by commercial banks and individuals.

Low Interest Rates.—The activities of the system and its policies helped to maintain low-interest rates on government obligations during the entire decade by keeping rediscount and loan rates low. Rediscount rates to member banks, for example, were reduced from 1½% in 1936 to 1% in 1946.

Reserves (deposited with the local federal reserve bank by each member bank) rose from \$6,500,000,000 in 1936 to nearly \$16,000,000,000 in 1946. This steady rise during the decade greatly increased resources of the federal reserve system. One reason for the increase in member bank reserves was a change in policy of the system which, in 1936, required 13% of demand deposits (checking accounts) to be kept in the federal reserve bank as a reserve by each bank in a central reserve city. At the end of the decade, the requirement was 20%. For banks in reserve cities, the requirement in 1936 was 10% and at the end of the period, it was 20%. Country banks were required to keep 7% on reserve in 1936 and 14% in 1946. In addition, every bank

was required to keep 3% of its time deposits (savings) as a reserve in 1936 and 6% at the end of the decade.

Control of Consumer Credit.—During the war, the fed-

Control of Consumer Credit.—During the war, the federal reserve system was given the responsibility of controlling consumer credit (q.v.).

In its annual report to congress in June 1946, the board recommended that congress give consideration to the question of whether regulation of consumer credit should be continued on a peacetime basis as a subordinate but strategic factor in the maintenance of economic stability.

The report stated: "Over the past thirty years, consumer instalment financing has come to occupy an important and strategic place in the national economy. Such financing is essential to the mass distribution and consequently, to the mass production of consumers' durable goods. From time to time, however, the expansion and subsequent contraction of consumer credit have gone so far as to accentuate the upswings and downswings of the business cycle. There is no way of preventing such excessive expansion and contraction except governmental regulation of the terms on which consumer credit shall be made available, such as the down payment required on instalment sales or financing and the length of time permissible for instalment contracts."

The regulation was revised, in the light of the foregoing considerations, to focus it on instalment credit, both instalment sales and instalment loans, which constituted the great dollar bulk of credit subject to the widest expansion and contraction. Charge accounts and single-payment loans, in which cyclical fluctuations had been comparatively small, were eliminated from the scope of the regulation. By elimination of goods generating only minor amounts of instalment credit, the instalment sales provisions were confined to 12 major categories of consumers' durable goods. Instalment loans of \$2,000 or less, whether or not to buy goods in these 12 categories, continued to be subject to the regulation. The revision effected a substantial simplification of the regulation's provisions and made it administratively more workable.

Member Banks.—Net profits of member banks after taxes increased by \$139,000,000 in 1945 and reached a new peak of \$788,000,000. They had been rising steadily after 1942, and in 1943 had attained the highest point ever reported up to that time. Income from government securities and profits on sales of such securities were the principal sources of income. About one-third of net profits was paid out as dividends, and the remainder was added to capital accounts.

Earning assets of member banks exceeded \$107,000,000,000 at the close of 1945, having increased almost \$16,000,000,000 during the year. In amount, the increase was about the same as it had been in 1944, but as a percentage of total earning assets it was less than in any year after 1941. During the U.S. defense and war period, 1940–45, earning assets almost trebled, and an increasing proportion of the total consisted of United States government securities. At the end of 1945, this proportion was nearly 75%.

This level of bank profits, as compared with that of the late 1920s, resulted from circumstances different from those prevailing at that time. Total earning assets of banks were about three times as large in 1945 as in 1929. The rate of interest return on the earning assets, however, was decidedly lower. While the level of market interest rates fell substantially for a decade and a half, the average return received by banks from earning assets dropped even more. The composition of earning assets shifted from a dom-

inance of loans, a high-yield asset, to government securities, the lowest yielding of all earning assets. At the same time, however, losses declined greatly, while profits on securities sold and recoveries expanded.

This was also a profitable earning period for the federal reserve banks. In 1937, their total earnings were a little more than \$10,500,000; in 1945, the total earnings were more than \$92,500,000.

Foreign Transactions.—The year 1937 was marked by considerable, though gradual, shifts in foreign viewpoints toward the future of the price of gold, accompanied by heavy international movements of floating money. For a time following the Tripartite declaration in Sept. 1936 and the readjustment downwards of the currencies of France, Switzerland and the Netherlands, international currency relationships appeared to be more settled, and flights from one currency to another ceased; instead, there was a movement to get idle funds invested. It was a period of sweeping advances in most of the leading security markets, during the course of which large amounts of foreign capital were placed in U.S. stocks.

The peak of this movement was passed in Nov. 1936, but as the year 1937 opened, foreign investment in U.S. securities continued at a substantial, though diminished, rate. An additional influence tending to bring gold to the United States at this time was the transfer of Argentine funds for redemption of dollar bonds. The Argentine operations began in Dec. 1936 and were in heavy volume throughout the first quarter of 1937.

Stock market developments and the Argentine redemptions were both associated with the vigorous industrial advance. Recovery in the industrial nations gave Argentina the broadened markets for its products that enabled it to transfer funds in retirement of outstanding obligations in the United States. Expanding industrial profits, particularly in the United States, underlay the rise in equities.

Toward the end of 1936 it was apparent that the industrial movement was leading to speculative developments in certain commodity markets. This tendency continued through the first quarter of 1937.

The volume of foreign transactions passing through the Federal Reserve Bank of New York continued large during the decade. The magnitude of these transactions on behalf of the United States government departments and agencies declined sharply after V-J day, amounting to about \$40,000,000 in December as compared with a monthly average of around \$100,000,000 during the summer and with a peak of more than \$200,000,000 in Jan. 1945. At the same time, other activities increased as relations were resumed with a number of central banks in countries formerly occupied by the axis nations.

At the end of 1945, the Federal Reserve Bank of New York held accounts for the central banks of governments of 60 foreign countries.

The tendency in the latter months of the year was toward a reduction in the amount of dollar funds, which declined by an over-all amount of \$340,000,000 for the year. At the year end, these balances amounted to \$861,000,000 as compared with the high of \$1,246,000,000 recorded in June and the all-time high of \$1,650,000,000 for May 1944.

Holdings of United States government securities for account of foreign central banks and governments increased from \$960,000,000 in Dec. 1944 to \$1,696,000,000 in Oct. 1945, after which they declined. Gold held under earmark rose from \$3,937,000,000 in Dec. 1944 to \$4,294,000,000 in

Dec. 1945.

Exports and imports of gold were on a comparatively small scale.

New Check Collection System.—The American Bankers association and the federal reserve banks announced a plan in 1944 to make it easier for banks to sort checks for collection through the federal reserve system. The association distributed a booklet to all banks in the country describing the plan, and the reserve banks circularized all par-remitting banks in their respective districts.

Under the plan, "check-routing symbols" were assigned by the federal reserve banks to all par-remitting banks. It was recommended that the symbol be printed in the upper right-hand corner of checks, above the dollar amount, in combination with the A.B.A. transit number, which had been in use for years to identify the bank numerically. The A.B.A. transit number appeared as the numerator and the check routing symbol as the denominator of a fraction, as in the following example:

55-38 312

In the example, the first part of the A.B.A. transit number (to the left of the hyphen) designated the reserve city or state in which the bank was located (in this case, New Jersey), and the second part designated a specific bank in that state (Citizens' National bank, Collingwood).

In the check-routing symbol (the denominator of the fraction) the first digit designated the federal reserve district; the second designated the head office of the federal reserve bank, a branch office, or a special collection arrangement and the last digit indicated whether or not the check was receivable for immediate or deferred credit. In the example, the first digit designated the third federal reserve bank district, the second the Federal Reserve Bank of Philadelphia and the last indicated that the item was receivable for deferred credit.

This system was put into use rapidly, and had a money-saving result not only for individual banks but also for the federal reserve system. (See also Banking; Consumer Credit.)

Federal Security Agency

Establishment of the Federal Security agency on July 1, 1939 brought together in one administrative organization major activities representing the responsibilities of the U.S. government for promoting and maintaining the health, education, economic security and welfare of the people. Continuing peacetime programs under the administration of the agency were all in operation prior to 1937.

Special emergency functions were assigned to the agency during the period of defense preparation and prosecution of World War II.

Public Health Service.—The U.S. public health service, oldest of the agency's units, had its inception in the marine hospital service established in 1798. As needs arose, various legislative enactments through the years extended its scope and functions until in 1944 passage of the public health service act consolidated and revised existing laws and materially strengthened the entire program for pro-

tection of the nation's health. Functions of the service during the decade included maintenance of quarantine services to prevent introduction of communicable diseases from abroad or spread of such diseases from state to state; research on the cause and prevention of diseases; assistance to state and local health services through technical assistance, leadership and the administration of federal grants-in-aid to the states.

During the war many public health service officers were assigned to emergency duty in the United States and abroad, and the service carried on special functions in connection with health needs of war congested communities, foreign quarantine procedures, control programs to deal with diseases constituting special wartime hazards, research for the army and navy, supervision of the production of biologic products for use by the army and navy and intensified industrial hygiene activities. The service also administered the U.S. cadet nurse corps (see Nursing, War.)

Office of Education.—Established by congress in 1867 to further the cause of education throughout the country, the U.S. office of education continued its services for state education authorities and the schools, colleges and libraries of the nation. Its functions were expanded and developed; it carried on many fact-finding, informational, research, advisory and other services through which knowledge and experience in all phases of education and from all parts of the country were pooled and made available for the guidance of school authorities. The office also had the responsibility of administering various federal grants to the states for educational purposes. During the war emergency the office administered several war training programs under which more than 11,500,000 men and women were enrolled and an additional 2,000,000 received instruction at the college level in engineering, science and

Food and Drug Administration.—The Food and Drug administration was set up by congress in 1927 to carry on regulatory activities begun some 20 years earlier in the department of agriculture. The administration received authority under several laws, of which the most far-reaching was the Food, Drug and Cosmetic act of 1938. The purpose of the laws administered by the Food and Drug administration was to protect consumers from products that might be objectionable for a variety of reasons—injurious to health; filthy or decomposed; short in weight or volume; debased with inferior ingredients; falsely labelled as to identity, quality, quantity or therapeutic or nutritional efficiency; or misrepresented in their labelling or in some other way (see also Drug Administration, U.S.).

In addition to extensive services for the armed forces during the war, regulatory work of the administration was directed toward maintaining the integrity of civilian supplies of foods and drugs and to preventing the criminal wastefulness which would result from careless handling and storage of both raw materials and finished products.

Social Security Administration.—The Social Security administration was established in July 1946 replacing the Social Security board created by the Social Security act of 1935. The administration took over the functions of the board relating to old-age and survivors insurance, employment security and public assistance together with activities of the Children's bureau transferred from the department of labour in July 1946 (see Social Security).

Other FSA Offices.—The Office of Vocational Rehabilitation was established as a unit of the Federal Security agency in 1943, following enactment of the Barden-

LaFollette act which amended earlier vocational rehabilitation legislation and expanded and strengthened the state-federal vocational rehabilitation program originally established more than 20 years before.

Approximately 40,000 physically and mentally handicapped persons of working age were rehabilitated into gainful employment through services of the expanded state-federal vocational rehabilitation program during the fiscal year ending June 30, 1946. An additional 110,000 were in process of rehabilitation. It was estimated that throughout the nation at least 1,500,000 disabled persons were eligible for and could profit from vocational rehabilitation in order to become self-supporting or advance normally on jobs.

The Office of Community War Services was established during the emergency period as the war arm of the Federal Security agency. It served as a centre for health and welfare activities both within the Federal Security agency and in other federal as well as private national organizations. Throughout the country it worked with the states and their local communities to stimulate the development of health and welfare activities necessitated by the war.

Federal Trade Commission

The Federal Trade commission in 1946 adopted procedural policies designed to expand the co-operative phases of its work and thereby improve and expedite enforcement of laws under its jurisdiction. The program contemplated that the commission, through fuller utilization of its trade practice conference procedure, would cooperate more effectively with business concerns and adequately protect them and the public against unfair trade practices and monopolistic restraints. In accordance with the program the commission was to investigate probable violations of law and, where necessary, take uniform corrective action on an industry-wide basis rather than issuing complaints against individual violators. Where circumstances warranted, members of an industry were to be given an opportunity to eliminate unlawful practices through establishment of trade practice rules or by voluntary stipulations to cease and desist, making possible more prompt, equitable and economic settlement of issues.

The Federal Trade Commission act, basis of a major portion of the commission's work, was amended by the Wheeler-Lea act in 1938 to include the prohibition of unfair or deceptive acts in commerce, in addition to unfair methods of competition theretofore prohibited. It also specifically made unlawful the dissemination of false advertisements of food, drugs, cosmetics and curative devices.

In 1937 the commission began enforcement of the Robinson-Patman act of 1936, amending the Clayton act by restating and expanding the basic principle of prohibiting price and other discriminations injuriously affecting competition. Other sections of the Clayton act enforced by the commission were directed against specific devices tending to create monopoly or lessen competition such as exclusive-dealing contracts and certain capital stock acquisitions.

The Wool Products Labeling act, effective in 1941, prohibited misbranding and required informative labelling of wool merchandise. As empowered, rules and regulations for its enforcement and guidance to industry mem-

bers were promulgated. Continuous administrative compliance work thereunder involved inspections, examinations and correction of labelling practices.

During 1937-46 the commission annually issued an average of 258 complaints alleging violation of laws administered by it, and 227 orders to cease and desist from such violations. Over the same period it accepted annually an average of 444 stipulations wherein respondents agreed to discontinue unlawful practices.

The commission also administered the Export Trade act, permitting the organization, under stated restrictions, of associations engaged exclusively in export. Fifty such associations were registered with the commission in 1946.

In 1944 the commission instituted investigations under this act to determine whether certain associations had engaged in practices violative of law. After concluding investigations of two associations exporting phosphate rock, the commission made recommendations to the effect that they readjust their business to conform to law.

During World War II the commission conducted many special investigations for U.S. war agencies. It surveyed 4,300 companies in 24 critical material industries to ascertain the facts concerning their compliance with War Production board orders governing the allocation of the supply and priorities of delivery of such materials. Commission reports based upon studies of costs, prices and profits in industries such as bread baking, flour milling, biscuit and cracker, steel producing, paperboard and fertilizers provided these agencies with factual data for price stabilization functions. Other reports related to methods and costs of distributing important food products, wearing apparel, petroleum products, rubber tires, electrical household appliances and agricultural implements and to financial data concerning approximately 7,000 industrial corporations operating in 86 principal strategic material industries for 1939-40.

Before and after the war the commission reported to congress on such subjects as agricultural income; labour costs, profits and investment structure in the textile industry; agricultural implements and machinery; distribution policies in the motor vehicle industry; resale price maintenance contracts; milk distribution, prices, spreads and profits; cost of producing and distributing fish in the Great Lakes area, New England and on the Pacific coast; international phosphate cartels; and the wholesale baking industry.

In 1946, the Lanham act (effective July 1947) delegated to the commission important duties in respect to cancellation of registered trade marks.

Federal Works Agency

At the beginning of the decade which ended with the close of fiscal year 1947, the organizations of the United States government which later were consolidated in the Federal Works agency were engaged, for the most part, in

activities designed to create useful work for the unemployed.

From late 1940 to the surrender of Japan, operations of the agency were centred upon activities in aid of the national defense program, and later of the war program itself. A third phase of federal works evolution, the advance planning of public works, opened shortly before the end of the war.

For the first time in the history of economic depressions, the United States congress, in 1933, had adopted various measures, and voted large appropriations, for the purpose of ameliorating the lot of the unemployed. Among these measures was the National Industrial Recovery act, under which a nation-wide program of public works construction was launched. Later an organization was created to supplement such employment by making work available to the destitute both on construction of public value and on service projects of public usefulness.

These two programs were assigned to the Federal Works agency when that agency was established under President Franklin D. Roosevelt's reorganization plan no. 1 of 1939. Also incorporated in the new agency were all activities having to do with the construction, maintenance and operation of buildings owned and used by the federal government and the assignment of space in them; activities having to do with federal money grants to the states in aid of highway construction and activities concerned with slum clearance and the construction of low-rental housing for low-income workers.

The programs which thus became the responsibility of the Federal Works agency were assigned to organizations under the names of the Public Buildings administration, the Public Roads administration, the United States Housing authority, the Work Projects administration and the Public Works administration. An administrator was appointed to coordinate and supervise the work of these constituents. Later a constituent known as the Bureau of Community Facilities was created by the administrator.

Attacking the Depression.—From its inception in 1933 until its liquidation, the Public Works administration constructed 34.524 projects, ranging in size from a one-room school in Arizona to sewage disposal facilities in Chicago costing approximately \$60,000,000. The total cost of all PWA construction was \$6,128,757,391, toward which the federal government advanced \$3,346,059,543 in grants and \$810,327,627 in loans. The 1emainder was contributed by the benefiting communities.

Prevailing wages were paid on these operations, and peak employment was reached in July 1934, with 650,653 at work at construction sites, and an estimated 1,200,000 employed off the sites in mines, factories and on the railroads in the production and transportation of the needed materials. By May 1941, shortly before liquidation of the administration had begun, only 11,000 were employed at construction sites. By Jan. 1, 1947, liquidation had been completed except for a few projects involved in litigation or for which necessary materials could not be obtained.

The Work Projects Administration, unlike PWA, paid only subsistence wages and applied a means test to project workers. From its inception in 1934 until its liquidation June 30, 1943, WPA assisted in financing 1,368,363 projects on which a total of 8,000,000 separate individuals were given employment. The projects covered a wide range of manual and intellectual activities, including building construction, road construction, the writing of guide books, teaching and economic research. Total federal appropriations for the program were \$10,875,449,892

of which approximately \$107,000,000 in unexpended funds, and materials and equipment valued at \$22,000,000, were returned to the treasury at the conclusion of the program.

Co-operating in these programs of work relief were the Public Roads and Public Buildings administrations and the United States Housing authority. Several hundred public buildings, principally post offices, and many hundreds of miles of highways were built with funds allotted from emergency fund appropriations.

Although slum clearance and the construction of lowrental housing were the primary functions of the United States Housing authority (established in 1938), the operations of that organization did, of course, provide a large volume of employment (52,814 were working at the sites in Sept. 1940).

All housing functions of Federal Works agency were transferred to the National Housing agency when that organization was created by executive order Feb. 24, 1942. Prior to that time the United States Housing authority had constructed 132,650 dwelling units in 399 projects in 37 states at a cost of about \$500,000,000. In 1941 the average rental per dwelling unit ranged from \$14.28 to \$21.10, depending upon geographical location. The rental price included the cost of such utility services as water, gas and electricity.

Aid to the War Effort.—Under the impact of war in Europe and preparation for war at home, the huge labour surpluses of the preceding decade of the 1930s were turning, by 1940, into labour shortages in many areas. As the manufacture of aeroplanes, ships and munitions of war expanded, thousands of communities rapidly grew in population and many entirely new communities arose. In all these places an acute housing shortage quickly developed. By late summer of 1940 thousands of war workers and their families were living in tents, trailers or abandoned buildings, and many were commuting to work a distance of 50 mi. or more.

To relieve this acute need for housing, congress, in Oct. 1940, enacted the Lanham act (public law no. 849, 76th congress) authorizing the Federal Works administrator to construct, or otherwise provide, housing for war workers and the military. The following June the act was amended to assign to the administrator responsibility for providing public works—such as sewers, water works, schools, hospitals and police and fire protection—when the failure to provide them would impair production for war, in communities which themselves were unable to finance them without an excessive increase in taxes or an excessive increase in bonded indebtedness. The act also authorized the administrator to grant financial assistance, where necessary, for the maintenance and operation of such facilities.

Prior to the transfer to the National Housing agency of all federal activities having to do with housing, the Federal Works agency had completed 61,199 dwelling units, had 91,478 units under construction and had assigned 159,258 additional units for construction.

The agency retained the Lanham act public works program which was administered in separate divisions of the office of the administrator until Jan. 1, 1945, when the program was assigned to the newly created bureau of community facilities.

Retween July 1, 1941, and the surrender of Japan in Aug. 1945, 4,062 public works construction projects were approved under the Lanham act at a total estimated cost of \$457,734,926. Of the estimated cost, \$361,828,131 was represented by federal funds while \$95,906,795 was con-

tributed by the sponsoring communities. The program included 1,144 new school buildings, 872 hospitals, 460 water-supply projects, 444 sewer projects, 725 recreation projects, 160 fire and police stations, 90 buildings for child care and 80 miscellaneous projects.

U.S. entry into the war found over-crowded communities lacking many facilities essential to well-ordered community life and no less lacking in financial resources to maintain and operate some already existing facilities and those acquired during the war. Public school systems especially were confronted with excessive demands upon their resources as the children of newly-arrived war workers crowded into the classrooms. Of \$120,165,151 granted in federal funds for the support of 3,056 maintenance and operation projects of all types, \$40,809,733 was allotted to overcome school deficits.

As the shortage of male labour became more and more critical, government and industry appealed to women to enter munitions factories. Young married women were reluctant to accept employment outside the home unless some provision could be made for the care of their young children during working hours. Makeshift arrangements made by the mothers themselves too often proved inadequate. To enable these women to remain on the job, 830 child-care projects were established in as many cities and supported from fees paid by parents for services rendered, from community contributions, and from \$52,942,954 in federal grants. Federal support was withdrawn from the child-care program March 1, 1946, but contributions for the operation of regular school programs were continued through the remainder of the school year.

To assist in the maintenance and operation of 98 hospitals a total of \$16,510,395 in Lanham act funds was granted, while recreation projects received \$7,639,933 in assistance, fire and police protection \$1,534,937 and miscellaneous municipal services \$727,139.

To accommodate rapidly expanding governmental war agencies, 28 temporary office buildings were constructed in the District of Columbia by the Public Buildings administration, which also erected and managed for the account of the Federal Public Housing authority 18 dormitories in four groups for 10,721 female employees of the government. Office space rented and assigned throughout the country and in the District of Columbia by the Public Buildings administration for government agencies increased from 73,798,047 sq.ft. in 1940 to 226,014,916 sq.ft. in 1944.

In a further effort to relieve congestion in Washington, the Public Buildings administration removed 57 federal agencies, or parts of agencies, and 16,771 of their employees and their household and personal effects, to locations in 57 cities in 32 different states.

Advance Public Works Planning.—A totally new approach to the use of public works construction as a means of providing needed employment at the onset of a depression became possible in 1945 when, under the authority of Title V of the War Mobilization and Reconversion act of 1944, the Federal Works agency began advancing federal funds to the states and their political subdivisions to help finance the detailed planning of public works. The need for such a program had been demonstrated in 1933, when an immediate full-scale attack upon unemployment proved impossible because very few detailed working drawings and specifications for public construction were available. Many months elapsed, during which unemployment increased, while architects and engineers were preparing the

plans without which no men could be given employment at construction sites.

To finance the preparation of a nation-wide shelf of public works plans as authorized by the War Mobilization and Reconversion act of 1944, congress had appropriated \$65,000,000 by July 1, 1946. The law required that 90% of the available funds be allotted among the states in proportion to population, provided that not less than onehalf of one per cent of the total amount available be allotted to any one state, while 10% could be allotted in the discretion of the administrator. Advances were to be repaid without interest when the actual construction of works so planned was begun. By early autumn, 1946, approximately half of the available funds had been allotted for the planning of specific local projects with an estimated construction cost in excess of \$1,000,000,000.

The Public Buildings administration and the post office department jointly listed a need for approximately 4,000 additional federal buildings, principally post offices, but also including government office buildings, court buildings, quarantine and border patrol stations, customs houses, garages and other structures. Construction labour and many types of materials were still in short supply, however, and precedence was given, as a matter of federal policy, to the construction of homes for war veterans. Accordingly, construction of all but a few of the federal buildings proposed was deferred, but detailed plans were being prepared wherever possible. It was expected, therefore, that at the threat of another depression plans for federal, state and local construction would be ready to throw into the breach to help check rising unemployment. By timing public construction to coincide with a slackening of private construction it was believed that the construction industry, normally accounting for more than ten per cent of the national income but traditionally subject to violent fluctuations, could be partially stabilized.

Additional Programs.-The so-called G.I. Bill of Rights held forth to veterans of World War II the promise of further education, largely at government expense. Beginning in Sept. 1945, however, colleges and universities throughout the country were turning away veteran applicants for admission because of lack of classrooms, laboratory space and other educational facilities. In Aug. 1946, congress appropriated \$75,000,000 to the Federal Works agency to be used in disassembling and transporting surplus military buildings to college campuses to be reassembled for educational use. This program was proceeding rapidly through the 1946-47 academic year.

Contracts were let in 1946 for the initial projects of a \$10,000,000 improvement program for the Virgin Islands assigned to the agency by congress. This program included highways and roads, sanitation and fire-protection facilities, public markets and an abattoir and cooling plant facilities. (See also Housing.) (P. B. F.)

047
320

A number of other countries produced amounts varying from a few hundred to a few thousand tons, and no data were available from several others, of which Czechoslovakia was probably the most important, with an output of some 30,000-35,000 tons.

The bulk of the feldspar continued to be produced and consumed in the United States, the outputs of other countries being small in comparison. Except for declines in 1938 and 1942-1944, production expanded continuously. The chief reason for the increase was the growing demand in the glass industry. In 1937, the glass industry used 142,-028 tons of feldspar and the pottery industry 102,346 tons (51% and 37% respectively of total consumption); in 1945 the glass industry required 249,927 tons, as compared with 111,695 tons for pottery (66% and 29% respectively of total consumption). This heavy increase in the demand for feldspar in glass making developed side-by-side with a similar increase in the use of other minerals (nepheline syenite, aplite and volcanic ash) for the same purpose, that is, the introduction of alumina into the composition. During the same time other uses for feldspar declined from 35,000 tons a year to 20,000 tons. The bulk of the United States consumption continued to be supplied by the domestic output, only relatively small amounts being imported, usually all from Canada. Small tonnages of Cornwall stone imported from Great Britain gave some promise of replacing feldspar in some uses. (G. A. Ro.)

Fencing

The year 1936 had seen the most colourful Olympic games held until that time and, in the fencing events, the greatest number of participating nations of any tournament. Italy and Hungary starred, with the former winning the team and individual events in foil and épée, and the Hungarians winning the team and individual in sabre and the women's individual. The United States team was eliminated in the semi-finals of each weapon. In each event they placed third in their pool of four teams. However, they gained valuable experience with which to improve fencing in the United States.

The years between the '36 Olympic games and prior to World War II were the boom years in United States fencing. Hundreds of high schools and colleges added fencing to their varsity sports. In the east a new intercollegiate group formed a league and held an annual championship; the first tournament attracted representations from 26 colleges. This was in addition to the Inter-collegiate fencing association championship-the Big Ten of the midwest

and the Pacific Coast league. The tournament of this new group later became the annual N.C.A.A. championship. In the Amateur Fencers League of America, 12 new divisions were granted charters, and the national championships attracted a greater number of competitors from the Pacific coast and midwest in each succeeding year.

The enthusiasm of the returning Olympians for international competition manifested itself in 1937, when for the first time a United States team entered the world championships. The experience gained in the Olympics was shown when Col. Thomas Sands, a member of the 1936 U.S. Olympic team, placed 5th in the 1937 world championship held at Paris. At Montreal in 1938 a U.S. team of John Huffman, Miguel de Capriles and Warren

Joanna de Tuscan, champion woman fencer of Detroit, Mich., in a practice bout

Dow (alternate) defeated a Canadian team of George Otis and Henry Silvestore, 11-1, in the first round of the International match for the Russell trophy. Later in the same year a team of John Huffman, Warren Dow, Miguel de Capriles and José de Capriles defeated a Cuban team of Eugenio Garata, Carlos Lamarr, Eugenio Sardina and Diosdado del Pozo, two matches to one, for the Col. Batista International Épée Team trophy. The United States team also defeated the Cuban team in the second round of the Russell trophy International tournament 7-5. Both matches were held at Havana, Cuba.

The first retrogression in international competition came when the United States-British quadrennial match for the Col. Thompson International trophy was postponed in 1938. This match had started in 1921 and had been held in 1923 and 1926 and then on a four-year basis until 1938. The United States had won four of the five competitions held. The shadow of war was becoming evident in

Europe as several European countries refused to compete in the 1938 world championships for political reasons. Therefore, the results of the competition were hardly indicative of world championship fencing. In 1939 the United States team defeated the Cuban team the second time for the Col. Batista Trophy, two matches to one. Also in 1939 the United States championships were held in San Francisco. This was the first time they were held away from New York.

With the war in Europe forcing the abandonment of fencing (except for a few tournaments in Germany, Italy and Hungary) most of the fencing was centred in the United States until U.S. involvement in the war caused a necessary curtailment. Throughout the war years fencing competitions were held, and the United States championships were attended by those who remained or could get leave from the service.

The abandoning of the 1940 Olympic games was a blow to United States fencing enthusiasts who had continued to hope for an early peace. However, they continued with their training plans, and an official Olympic team was selected as had been done in many of the other sports.

After the war, fencing was resumed with great activity in the United States and Europe (Germany excepted, where it was banned by military decree). In all fencing countries, preparations were being made for participation in the 1948 Olympic games. (W. A. Dw.)

Fertilizers

World War II caused abandonment of the reasonably good international statistics built up prior to 1939. For many years the International Institute of Agriculture at Rome, in its International Year Book of Agricultural Statistics, last issued in 1940, provided the best comparable information concerning fertilizers. This source was interrupted by termination of the institute and absorption of its work by the Food and Agriculture organization (F.A.O.), a subordinate body of the United Nations. As a result, comparisons covering the years 1939-45 for most countries were based upon incomplete information and reports of observers who investigated the situation, especially in connection with international reconstruction or relief. Discussion and tables were confined largely to comparisons between prewar averages (1936-38), and the year 1945-46. When data in the accompanying tables for the immediate prewar years are not available, nearby years are used. Prewar figures usually include the soviet union; postwar figures do not.

World Consumption of Plant Food.-Prior to World War II, world consumption of fertilizers and fertilizer materials was about 59,000,000 tons. It is impossible to give a statistically-based total for any year of the decade after 1938, but the Committee on Fertilizers of the Combined Food Board stated that it allocated approximately 40,000,000 tons of fertilizers of all kinds in 1945-46.

Totals and details for selected countries of prewar annual consumption of plant food, as estimated by K. G. Clark and Mildred S. Sherman of the U.S. department of agriculture, are shown in Table I.

Table 1.—Prewar Consumption of Plant Food in Selected Countries*

Country	Nitrogen	Phosphoric Acid	Potash	Total
Canada	16,200	37,500	24,900	78,600
Chile	10,700	6,600	0	17,300
France	170,600	389,300†	289,200	849,100
Germany	629,700	731,900†	1,047,500	2,409,100
Italy	128,100	241,900	16,000	386,000

Table IV Fratilism Comment

Canada.—With a consumption of 20,700 tons of nitrogen, Canada had three privately-owned and three government-owned nitrogen fixation plants with a total capacity of 250,800 tons yearly. The outstanding wartime development was the great growth of nitrogen production from the prewar average of 51,500 tons, mostly as calcium cyanamide, to 199,500 tons in 1945–46, mostly as ammonium nitrate.

The first ammonium nitrate available for agriculture appeared in 1943. The surplus over munition and other industrial needs rose to 185,105 tons of the material in 1944–45. Considering its 60,000,000 ac. of cultivated land, Canada was a small user of fertilizer. Sales for home use in 1944–45 were about 500.000 tons, whereas United States consumption for the calendar year 1945 was 13,202,000 tons.

Chile.—Chile remained the world's greatest producer of sodium nitrate (15.5% nitrogen). In 1937, production was 1,584,000 tons, and in the year 1945–46 was about 1,650,000 tons.

United States imports in the calendar year 1945 were 849,888 tons.

From 1941 to 1944, Chilean technicians and labourers installed a plant using the Norwegian "Krystal" process, new to Chile. Chile's problem in the postwar nitrogen world was to retain its market for the natural product in competition with the great synthetic capacity.

Chilean nitrate refinery, near Tocopilla. Huge leaching vats are shown in the foreground

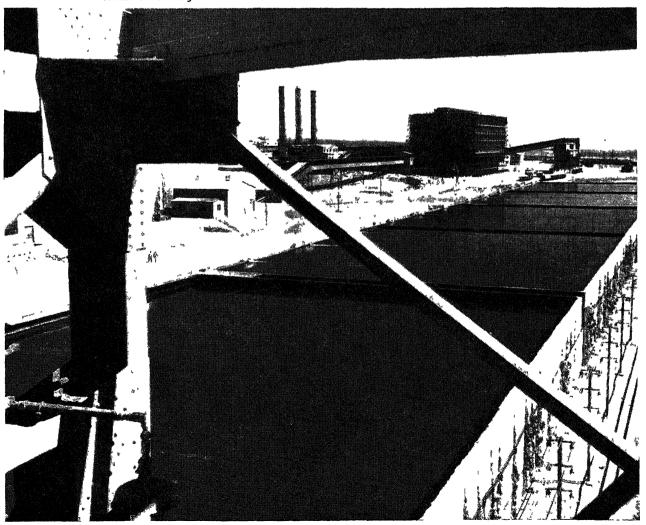

Germany.—Up to World War II, Germany led the world in fertilizer consumption, ranking first in nitrogen and in potash, and second only to the United States in phosphoric acid.

Germany originated both the cyanamide and the direct synthesis process of nitrogen fixation. In 1937, its 13 plants had a capacity of 1.505,000 tons of nitrogen. Wartime bombing, lack of coal and other materials, inefficiency of labour and other factors caused the 1945–46 production to decline to 137,500 tons.

Prewar consumption of phosphoric acid was about 732.-000 tons, obtained from basic slag and superphosphate. In 1945–46, consumption was approximately 150,000 tons. Basic slag contained approximately 28% P₂O₅, and prewar Germany's production (1937), consumed as fertilizer, was 2 980.000 tons of a world production of 6,010,000 tons.

Germany originated the modern potash industry and became the largest producer and consumer. While average prewar consumption was 1,047,500 tons, a likely estimate was that 1945–46 consumption amounted to about 660,000 tons, although some estimates ran higher (see Table III). Sixty-one per cent of German mining capacity was in the Russian zone of occupation. 22 in the British, 14 in the United States and 3 in the French.

Japan.—Precise knowledge of the postwar fertilizer situation in Japan was meagre. Fertilizers continued to be vital to that country, where some 72,000,000 people

relied primarily upon about 23,300 sq. mi. of arable land. Population per arable square mile in Japan was more than 3,100 persons, the densest in the world. Japan had about 14,902,000 arable acres, while the United States, with a population of approximately 140,000,000, had about 360,000,000 ac. under actual cultivation.

Japan's prewar nitrogen fixation capacity was about 550,000 tons, and it stood third in nitrogen fertilizer consumption. In 1945, production was less than 330,000 tons because of war damage to plants and lack of materials.

The total customary prewar consumption of plant foods in terms of N, P_2O_5 and K_2O was 670,000 tons. Consumption in 1946 was estimated at 156,500 tons. Of the 1946 consumption, only 2,200 tons was K_2O compared with a prewar average of 112,200 tons.

Soviet Union.—With more than 553,000,000 ac. of arable land, Russia consumed only 2.68 pounds of plant food per acre in the pre-World War II period. The Council for Collective Farm Affairs stated in 1946 that Russia had more than 1,000,000,000 ac. in farms. There was little specific information concerning developments in Russia after the outbreak of World War II.

Prewar production of nitrogen averaged 154,000 tons, all no doubt used domestically. Whether new plants were built during World War II was not known, but more than two-fifths, amounting to about 625,000 tons, of Germany's prewar capacity was located in the Russian zone. This included Leuna, the largest nitrogen fixation plant in the world.

European Russia's phosphate deposits were estimated at 6,060,000,000 tons, the Kola peninsula alone having more than 2,200,000,000 tons of these reserves. Kola apatite averaged about 30% phosphoric acid.

It had long been known that Russia had important deposits of potash salts, but soviet officials claimed that their country, because of new discoveries, had reserves estimated at 20,275,000,000 tons of potash. Formerly the German reserves of 2,975,000,000 tons K₂O were considered the largest in the world. The most important newly-discovered deposits were near Solikamsk in European Russia, west of the Urals, a region where explorations had been carried on for a number of years. In addition to its own potash deposits, 61% of German potash mining capacity and practically the whole Polish capacity came into Russian possession after World War II.

United States.—During the later war years the United States led the world in production and consumption of plant food. This explained in part the bumper food and feed crops shared with other nations during and after the war. Foods and fibres were a vital part of the \$30,000,000,000 worth of lend-lease materials sent to the United Kingdom, the \$11,000,000,000 worth sent to Russia and the large amounts sent to other countries.

Prewar apparent U.S. consumption of plant food was 1502,200 tons, while in 1945-46 it was 2,799,600 tons. In comparison, prewar German consumption was 2,409,100 tons; a realistic estimate of 1945-46 consumption was 970,600 tons. The quantity used by Germany in the prewar period was somewhat startling, as the reich had an area only two and one-half times that of Kansas.

In 1937, U.S. consumption of mixed fertilizer and fertilizer materials was 8,226,000 tons. It dropped back to 7,548,000 tons in 1938, and then rose steadily to between 13,750,000 and 14,000,000 tons in 1946. The average plant food content in 1945 was about 21%.

In addition to domestic nitrogen, U.S. at the end of the decade 1937–46 was the largest user of Chilean nitrate of soda. Imports had averaged about 125,000 tons, which could readily be increased to 150,000 tons or more.

The following tabulation compares U.S. domestic status prewar and postwar:

	Synthetic Nitrogen Plants		All Forms of Nitrogen			
Year	Number*	Capacity	Production	Consumption		
		tons	tons	tons		
1937	10	322,350	249,500	390,300		
1945-46	3 19	1,520,000	547,000	680,000†		

*In 1937 all plants were privately owned. For 1945-46 the figures include 9 private and 10 government-owned synthetic plants. In both years some small plants of negligible capacity are omitted.

†Includes Hawaii and Puerto Rico.

For more than 70 years America had led the world in phosphate rock production. In 1937 it was 4,771,000 tons, and in 1945 it was 6,504,000 tons. Prewar consumption was about 3,300,000 tons, and 1945 consumption 6,160,000 tons. Exports and stockpiling accounted for the differences. As the United States assisted in rehabilitating the phosphate rock industry of French North Africa, it is interesting to compare African prewar and postwar production with the figures given above. North African prewar production was 4,125,000 tons, while 1945–46 production was estimated at 4,800,000 tons.

In 1937, consumption of superphosphate was 4,434,000 tons, while in 1945 it was 5,295,472 tons.

The potash industry of the United States made phenomenal progress. Its development and its performance, especially during World War II, redounded greatly to the credit of private enterprise. According to the bureau of foreign and domestic commerce, production in 1927 was 43,510 tons, and imports were 224,973 tons. In 1937, production was 284,497 tons, and imports were 319,743 tons. In 1945-46 (June 1945-May 1946), according to the American Potash institute, total deliveries from domestic production were 908,976 tons. There were no imports. Total deliveries for agricultural use in United States were 741,855 tons, and shipments for use in Canada, Puerto Rico, Hawaii and Cuba totalled 79,827 tons. Approximately 60% went to Canada. Exports to other countries were 13,049 tons, and deliveries for industrial use 74,436 tons.

The 1937 census showed 743 fertilizer plants in the United States with sales in excess of \$5,000. There were about 20,900 wage earners, and the retail value of the fertilizer bought by the farmer was estimated at \$228,000,000. Census figures were unavailable for 1945, but there were probably no fewer than 850 plants and about 22,600 wage earners. Fertilizers produced cost the farmer at retail about \$440,000,000.

Fertilizers remained the cheapest commodity the U.S. farmer could buy for use in his production operations. Consistently after World War I, excepting only the period of the great depression in the early 1930s, the average price was below that of farm products and all commodities.

When the average of prices for the calendar years 1935 to 1939 is taken as 100, the index number of prices of fertilizers on Oct. 12, 1946, was 124.3; of all fertilizer materials combined, 122.5; of farm products at the farm, 218.2; while that of all commodities included in the National Fertilizer association's weekly index was 174.4.

U.S. Wartime Control.—Controls in the United States began with rationing of nitrate of soda in Jan. 1942, about two months after the Japanese attack on Pearl Harbor.

After consultation with the executive officer of the National Fertilizer association, an industry advisory committee of 16 members was appointed by the secretary of agriculture, and later was taken over by the War Food Administration. When the War Production Board, the Office of Price Administration, and other agencies and subordinate units were created, similar advisory committees were set up for each of them. Working arrangements were also maintained with the Office of Defense Transportation and the U.S. maritime commission. Effective co-operation was maintained by selecting outstanding members of the industry to serve on these committees. Government officials used the only nation-wide organizations in the industry, the National Fertilizer association and the American Potash institute, to assist them in accomplishing equitable distribution and fair pricing consistent with the farm production goals set up from year to year by the U.S. department of agriculture. Regular channels of distribution were used, and no attempt was made to ration fertilizer to farmers.

Maximum prices of nitrogen carriers, effective March 1942, were based on the average prevailing between Oct. 1 and Oct. 15, 1941. Maximum prices for retail sale of mixed fertilizers, superphosphate, and potash, based on price levels of Feb. 16 to 20, 1942, were put into effect in April 1942. To conserve fertilizers and fertilizer materials, specific lists of "approved" grades that might be used were issued, effective in Sept. 1942, and manufacturers were required to produce grades selected from these lists and no others.

Allocations, price ceilings and controls, approved grades and regulations covering other matters, adapted to the operations of the industry and the needs of the farmer, and changed from time to time when required, were continued until after the end of the war. By Nov. 1945, most controls except maximum retail prices to farmers had been removed. As of Oct. 1946, some price regulations were still in effect, as was allocation of potash and nitrogen.

Technical Advances.—Specific progressive developments in the United States during the decade 1937-46 included the following:

Great extension of the more efficient contact process for making sulphuric acid, rapidly superseding the old chamber process.

Production of granulated superphosphate containing 20-21% of available P_2O_5 instead of $18\%-19\frac{1}{2}\%$.

Widened use of starter solutions which cause transplanted crops like tomatoes, tobacco and others, to resume growth without loss of time after transplantation.

Consistent progress in increasing the use of more concentrated fertilizer mixtures and in devising new mixtures for specific purposes. Many chemical problems were solved, involving the reactions of the materials used in old and new mixtures. The increase of average plant food content of mixed fertilizers was from 18.86% in 1937 to 21.3% in 1944.

Perfection of processes and completion of their installation for making 60%–62% K_2O muriate of potash. Two U.S. producers used the fractional crystallization principle, and three used the flotation principle. The fractional crystallization process originated from earlier research by the bureau of soils, U.S. department of agriculture. Sixty per cent concentration largely displaced the 50% muriate of the days when almost all potash used in the United States was imported. Development of processes and their commercial operation for production of sulphate of potash from lake brines and saline minerals, and of sulphate of potash-magnesia from saline materials.

Reduced cost of producing ammonia by utilizing cheaper sources of hydrogen in synthesis, for example, natural gas. This applied particularly to certain of the wartime government plants which in the postwar period were making nitrogen for agriculture under private operators.

Large-scale conversion of synthetic ammonia into ammonium nitrate fertilizer containing 32.5%—33.5% nitrogen, together with the devising of practical economic methods for producing a non-caking, free-flowing material. No solid ammonium nitrate was used as such for fertilizer prior to 1943 in the United States or elsewhere. In the calendar year 1945 United States consumption was 271,000 short tons of 32.5%—33.5% material. This progress was due to the co-operation of United States and Canadian investigators, and to the help of the participating industrial units.

Improvement of methods of using nitrogen solutions in the ammoniation of superphosphate, and ammonia solutions of urea containing 37%-45% total nitrogen, and of ammonium nitrate containing 37%-41%. The development of these solutions was strictly a private industry accomplishment. The total quantity of nitrogen used in the form of urea and ammonium nitrate solutions amounted to 140,000 tons and 91,000 tons in the years ended June 30, 1944 and 1945, respectively. These figures include small quantities of anhydrous ammonia and ammonia liquor added to irrigation water and used in mixed fertilizers.

Formulation of fertilizer mixtures, neutral in reaction, which could slow down or prevent increase of soil acidity.

Increased use of the secondary elements, calcium, magnesium and sulphur, where soils and crops required them. Calcium and magnesium were added largely by the use of ground limestone containing those elements.

Greatly increased attention to the occasional need for the minor elements, manganese, boron, copper, zinc, iron, cobalt, molybdenum, etc. There was doubt whether cobalt, tin, vanadium and iron were essential for plant growth, although they are often present in crop plants.

Improved methods of application and machinery for applying fertilizer to soils and crops.

Addition of plant food to irrigation water, limited mostly to nitrogen compounds, chiefly anhydrous ammonia, and to liquid phosphoric acid. The addition of sulphur dioxide to irrigation water for the purpose of reducing the pH value of alkaline soils was developing on a small scale.

Outstanding advances in the manufacture of elemental phosphorus for conversion into fertilizers and technical chemicals. During World War II, much of the output of phosphorus was used for military purposes—incendiary bombs, smoke screens, etc.

Development and commercial operation of processes for the manufacture of alpha tricalcium phosphate. These involved the heating of phosphate rock at high temperatures in the presence of silica and water vapour, whereby the fluorine in the rock was volatilized and alpha tricalcium phosphate, suitable for use as fertilizer and as a phosphorus supplement in animal feeds, was produced. The basic laboratory research on this process was done in the department of agriculture, while the Tennessee Valley authority and private industry perfected the large-scale operations.

Notable technological advances in the manufacture of double superphosphate containing 45%-50% of available phosphoric acid. Production of double superphosphate

increased from 91,000 tons in 1935 to 329,000 tons in 1940. The production in 1945 was 251,000 tons.

Large-scale production of calcium metaphosphate containing about 60% of available phosphoric acid, achieved by the Tennessee Valley authority.

Development of a process for the removal of fluorine from superphosphate and its large-scale operation. The process provided a considerable quantity of low-fluorine phosphate suitable for use as a substitute for bone meal in animal feeds.

Production of solid urea containing 42% nitrogen on a large scale and marketing for fertilizer use. (See also AGRICULTURE.)

Fierlinger, Zdeněk

Fierlinger (1891—), Czechoslovak statesman and diplomat, entered the diplomatic service and held a number of important posts in the new Czechoslovak government formed after World War I. He was his country's minister to the Netherlands, Rumania, the United States and Switzerland and was permanent delegate to the League of Nations in 1928.

Fierlinger was minister to the soviet union in 1937-39 and 1941-42. In 1942, he was named his country's ambassador to the U.S.S.R.

As chairman of the Social Democratic party, Fierlinger was appointed prime minister of the Czechoslovak gov-

ernment April 7, 1945, after President Eduard Benes and other Czech leaders arrived at Kassa, liberated by the soviet armies, to re-establish the government on home soil. Shortly after his appointment, Fierlinger declared that "Slav peoples think it natural that they should group themselves around their great ally, the Soviet Union."

On June 8, 1945, he announced a radical program of social reform at a meeting of the Social-Democrat party in Prague. Cardinal points of his program were the basing of Czechoslovak foreign policy on its alliance with the U.S.S.R., establishing state control over monopolies and big banks, and employing gradual and peaceful measures in carrying out the government program. Other reforms pledged by Fierlinger were stabilization of Czechoslovak currency, the elimination of the power of the large landholders and protection of the interests of the small farmers. After the elections of 1946, Fierlinger resigned and was succeeded July 3, 1946, by Klement Gottwald, a Communist leader.

Figl, Leopold

Figl (1902—), Austrian statesman, was born Oct. 2, 1902, in Rust, near Vienna. He studied agronomy in Vienna and was director of the Austrian *Bauernbund* (Farmer's party). An opponent of nazidom and *Anschluss*, Figl was arrested by the gestapo and spent about five years in German concentration camps, at Dachau, Mauthausen, Flossenburg and elsewhere. Released in May 1943, he joined the Austrian underground.

After Austria's liberation, he became a member of the Austrian Catholic People's party, rising to chairmanship of the party. Following the national elections of Nov. 26, 1945, in which the Catholic People's party won the majority of seats in the new assembly, Figl was named (Dec. 4) by the Austrian political council to form a new government to succeed the interim regime headed by Chancellor Karl Renner. He was sworn into office on Dec. 20, 1945. The following day, in his inaugural address before the national assembly, he appealed to the occupation powers to reduce the occupation troops to the lowest possible minimum.

In July 1946 he clashed with the soviet occupation authorities over his government's nationalization proposals; the U.S.S.R. asserted that the plans collided with its interests. Figl also denounced soviet seizure of property defined by the U.S.S.R. as having been nazi-owned after the Anschluss, declaring that the soviet definition of the seizure terms was too flexible and included property that was genuinely Austrian and not German.

Finland

An independent republic of northern Europe, Finland had an area of 134,000 sq.mi. (land area, 121,000 sq.mi.), after cession of 13,500 sq.mi. to the U.S.S.R. in 1940 and again in 1944. Capital, Helsinki; pop. (est. Jan. 1, 1939) 304.965. Other principal cities: Turku (Abo) (74.351); Tampere (76,730). Religion, Lutheran Christian. Population (est. 1940) 3,850,000. Language and nationality, 90% Finnish, 10% Swedish. About 60% are engaged in agriculture, 17% in mining and industry, 3.8% in transportation, 4.3% in commerce, 2% in public administration, 2% in professions, 11% miscellaneous. The density of population in 1940 was 26.1 per sq.mi.

Presidents of Finland during the decade 1937-46 were: Pehr E. Svinhufvud (1931–37); Kyosti Kallió (Feb. 1937– Dec. 1940); Risto H. Ryti (Dec. 1940; re-elected Feb. 1943, resigned Aug. 1, 1944); Carl Gustav von Mannerheim (Aug. 1944-March 1946); and Juho K. Paasikivi (after March 1946). Prime Ministers were as follows: A. K. Cajander (1937-Dec. 1, 1939); Risto Ryti (Dec. 1, 1939-40); J. W. Rangell (1940-43); Edwin Linkomies (1943-Aug. 1, 1944); Antti Hackzell (Aug. 1944-Sept. 1944); Urho J. Castrén (Sept. 1944-Nov. 1944); Juho K. Paasikivi (Nov. 1944-March 1946); Mauno Pekkala (after March 1946). Paasikivi acted as president during Mannerheim's illness in the spring of 1945 and in his absence at the end of the year; he was elected by the Diet as president on March 9, 1946, after Mannerheim's resignation, to serve out the term to March 1950. The Anglo-Soviet Control commission was headed by Col. Gen. A. A. Zhdanov.

Finland's Hope, Pre-1939.—Finland, for many centuries a dependency of Sweden and after 1809 of Russia, had advanced considerably in the 19th and 20th centuries in population, economic well-being and cultural achievement. With the winning of independence at the end of World War I there began a widespread revitalization and flowering of Finnish culture. Runners like Paavo Nurmi, skaters like Klas Thunberg, "Nurmi of the ice-track," established world records and world reputations. Eliel Saarmen, architect of the magnificent railway station in Helsinki, continued his work in the U.S. Jan Sibelius wrote symphonies of power and nationalistic flavour and was recognized as one of the world's great composers. Literature and publishing flourished, and education made rapid strides.

Industry developed and foreign trade expanded. The co-operative movement was an important factor, coming to account for one-third of the domestic trade. Some 7,500 co-operative associations included about three-fourths of the people. In 1936 the two great consumers co-operatives (S.O.K.—Finnish Co-operative Wholesale society and O.T.K.—Co-operative Wholesale association) had a turnover of \$80,000,000 in some 500 stores. There were 700 dairy co-operatives, and the central dairy co-operative handled 95% of Finland's butter exports, most of which went to England. The co-operative credit society was important in the national financial system. Farsighted labour legislation provided for a compulsory eight-hour day, two weeks annual vacation with pay, arbitration boards and such matters as health and accident insurance.

Finland had always been in the position of buffer between east and west, and with independence there came a nationalistic emotion in the defense program. Strong fortifications and a large army were supplemented by a women's defense corps of more than 100,000—the Lotta Svärds—named after a heroine of one of Johan Runeberg's nationalistic tales of war in the east.

The great new future opening up for Finland even inspired a birth rate of 15%, as compared with the all-European rate of 10%.

In 1937 Finland was still essentially optimistic, but by 1938 the handwriting on the wall was all too evident. In May 1938 a seven year defense program was voted by the diet. It was to cost \$60,000,000 and necessitated an increase of 20% in the income tax. In that same month the country celebrated the 20th anniversary of independence. Finland had signed a ten-year nonaggression pact with the U.S.S.R. in 1934, and it maintained hope in that, although it was obvious by the spring of 1939 that Munich had brought no real peace to Europe. In 1940 the Olympic games were to be played in Helsinki, and the Finns went ahead with preparations to entertain the international gathering.

But the clouds over Finland grew darker and darker as the summer of 1939 passed into autumn. The negotiations between the U.S.S.R. and the western powers broke down, the soviets signed an agreement with Germany, the nazis invaded Poland. The soviets then not only marched into eastern Poland, but demanded and obtained special military privileges in Estonia, Latvia and Lithuania. On Oct. 5, 1939, the U.S.S.R. invited a Finnish delegation to come to Moscow to discuss political questions. Finland sent Dr. Juho K. Paasikivi, minister to Sweden and one of the peace delegates of 1920, and (later) V. Tanner, minister of finance. The U.S.S.R. asked a 30-year lease of Hanko, southwest Finnish port, for a soviet naval base and garrison for 5,000 men; it asked for the cession of several different bits of territory near its own borders: some islands in the Gulf of Finland (Hogland [Suursaari], Sei skari, Lavan saari, Tytär saari and Björkö [Koivisto]); part of the Karelian isthmus from Lippola to the village of Björkö; the western part of Fishermen's peninsula (Rybachi) in the district of Petsamo on the Arctic. This was in all about 1,066 sq.mi. in strategic locations, and Finland was to receive as compensation about 2,135 sq.mi. in the region north of Lake Ladoga. The two states were to agree also not to enter any alliances directly or indirectly hostile to the other; there were to be no fortified zones on either side of the Finnish-Russian frontier; Finland might fortify the Aland Islands, but only alone, not with the aid of Sweden or other foreign state.

The Finnish counterproposals (Oct. 25) were conciliatory. They offered cession of most of the islands demanded and an adjustment of the frontier in the Karelian isthmus, and agreed to supplement the nonaggression pact with a political agreement such as requested by the U.S.S.R. Finland rejected outright only the claim to Hanko for a naval base, on the ground that it would not be compatible with Finnish neutrality.

Negotiations continued for three weeks, but on Nov. 13 the Finns left Moscow. A violent press and radio campaign ensued in the U.S.S.R. against Finland, leading to a charge (on Nov. 26) that Finnish artillery had fired on Soviet troops. Finland denied this, but proposed a joint investigation. On the 28th Soviet Russia denounced the nonaggression pact, disregarding agreed-upon procedure. Finland proposed arbitration (Nov. 29), but the U.S.S.R. had already broken off diplomatic relations.

The "Winter War."—On Nov. 30, 1939, Soviet Russia attacked Finland by land and sea, and by aerial bombardment of Helsinki and other cities. The U.S. offered its good offices, but the U.S.S.R. rejected the proposal. On Dec. 1 the Finnish cabinet was made a coalition of all parties, with Risto Ryti, governor of the Bank of Finland, as premier. Field Marshal Carl Gustav Mannerheim, hero of the war for independence in 1918, took over as commander in chief of the army.

The soviet government probably sincerely believed that the Finnish people were at heart communist, and that communist loyalties and ideology would take precedence over the nationalistic. Therefore, immediately after the invasion, the U.S.S.R. announced the setting up of a "People's Government of Finland" at Terijoki, close to the Soviet frontier. Leader of the group was Otto Kuusinen, exiled Finnish communist and one of the signers of the famous Zinoviev letter of 1924 to the British communists. Soviet Russia would no longer recognize the government in Helsinki.

Indignation was world-wide, and when Finland appealed for assistance to the League of Nations the council voted the expulsion of the U.S.S.R. from the League (Dec. 14, 1939). Large amounts of money for help to Finland were raised in Scandinavia, in Great Britain and in the U.S., and from Sweden came several thousand volunteers and quantities of war matériel and medicines (valued at \$125,000,000).

During the early weeks of the war the plucky Finnish army and its strong Mannerheim line of fortifications on the Karelian isthmus held the soviets, and north of Lake Ladoga the Finns invaded soviet territory. Soviet losses were immense, and Finnish resistance was heroic. Almost to a man the Finnish communists put Finland first and communism second. All turned out to fight the age-old enemy. Soviet hopes for an internal revolution were proved groundless, and the fighting proved too that the militia of Leningrad could not possibly cope with the trained and inspired soldiers under Mannerheim.

But gradually the U.S.S.R., which had underestimated both the determination and the skill of its opponents, brought to bear the weight of its vast resources of men and armaments. By slow but irresistible bombardments the soviets rocked the pillboxes of the Mannerheim line, bombed 32 of Finland's 38 cities, dropped about 100,000 bombs and destroyed 1,800 buildings. The number of Finland's killed and missing men mounted to almost 23,000 and another 43,500 wounded. With their line broken and the casualties rapidly increasing, the Finns could not hold out alone.

Volunteers from abroad could not reach Finland quickly enough or in great enough numbers. Troops from the west were not allowed to pass through Norway and Sweden in numbers greater than 100 per day because of the fear of the Scandinavian states that they would become themselves a main theatre of war. If large-scale aid came from Great Britain and France, it was obvious that Germany would take measures to check it. (See also World War II.)

Between Two Wars.—The result was that on March 12, 1940, the Finns signed a peace in Moscow. Territorially the treaty came to mean (with the agreement on details dated April 29) cession to the U.S.S.R. of: (1) the Karelian isthmus; this included the eastern islands in the Gulf of Finland, the city of Viipuri (Viborg) and the region around Lake Ladoga; (2) parts of the communes of Kuusamo and Salla on the middle eastern frontier; (3) the western part of

Finnish women clearing trolley tracks of snow and ice in the early months of 1940. These and other difficult duties were taken over by women so that men might be released for combat during the Russo-Finnish "Winter War"

the Rybachi peninsula on the Arctic sea (though Finland retained a tiny opening on the sea in the Petsamo region). In addition to these outright cessions, Finland leased to the U.S.S.R. for 30 years the Hanko peninsula. The U.S.S.R. had established itself once more in the Baltic. It had gained its demands, though at immense cost. In a short time it was to consolidate its position further in Estonia, Latvia and Lithuania.

Finland's losses, together with its pledge to complete an east-west railway across the central part of the country, meant an almost helpless strategic situation and severe economic loss. Finland lost access to Lake Ladoga and the eastern gulf coast where about one-third of its fishing had been carried on. It lost rich forest resources, 10% of its arable land, its fourth largest industrial centre (Vipuri) and 625 mi. of railway. Perhaps a fair estimate of the monetary losses was \$600,000,000, more than the annual national income. The losses were the more staggering because almost the entire population (450,000) of the ceded areas had to be resettled in other parts of a country of meagre natural resources, and a dry season reduced the food crops of 1940.

Money for war and reconstruction poured in from the outside world, especially from Sweden and the U.S. Hoover's "Finnish relief" for instance, raised about \$3,500,000. In 1939 and 1940 Finland had to postpone and ask for readjustment of its war debt payments to the U.S. This was granted, as well as extensive government credits. But the problems of rebuilding were accentuated by the continuance of war around Finland, which made impossible the resumption of normal trade. When in the late summer of 1940 the Germans asked for transit privileges

through Finland to Norway, the Finns were glad to grant the request, thinking that the presence of German troops might be a salutary warning to the U.S.S.R. to encroach no farther westward.

The leaders of Finland's second war of independence began even in 1940 to leave the stage. Baron Mannerheim, the military genius of the campaign, stepped into the background. The zealous peasant president, Kyosti Kallió, was stricken with a heart attack in August. In December he resigned, amid popular ovations to the reformer and statesman who personified the best of Finnish spirit. Ready to retire to his country home, he went to the railway station with a military guard of honour, turned and said to the people, "Good-byc, thanks for everything," and fell back dead in the arms of his friend, Field Marshal Mannerheim.

Elected to succeed him was the leading financial statesman of the country, the logical man to direct the economic reconstruction, former Premier Risto H. Ryti. The new president was once a member of the London bar and was known as an exceptionally able banker.

Finland tightened its belt and looked forward hopefully, sanely planning for the clearing of new lands and the building of new cities for the 500,000 homeless, and for the restoration of buildings, such as the demolished technical university in Helsinki. Finland's national independence was intact, and its spirit appeared to be equal to its emergency.

During the winter and spring of 1941 some German soldiers began to camp in Finland, but few people worried, except the soviets, who reported on April 26 that 12,000 German troops had landed at Turku. The British public thought that the soviets were just parading a ghost for some purpose known only to themselves. Meantime, a carefully suppressed controversy on neutrality was agitating Swedish-Finnish diplomacy. Forebodings of trouble accumulated. The British government sent a note to Helsinki announcing that no "navicerts" for ships to Petsamo would be issued after June 14, 1941, because they regarded Finland no longer "free." The British navy intercepted and detained three Finnish ships. On June 18 came rumours of an exodus of soviets from Hanko, their leased base in southwestern Finland. On the same day word leaked out that Finnish soldiers and "Lottas" (members of the women's detense corps) were crowding the streets of Helsinki.

War with the U.S.S.R. Resumed.—On June 20 the Finns reported soviet military movements in Lithuania and declared general mobilization. Two days later the Germans struck at the U.S.S.R. in the south, and on June 27, 1941, Pres. Risto Ryti announced that the soviets had again attacked Finland, and that "for the liberty of the fatherland" Finland was going to war alongside Germany and "their genial leader, Reichschancellor Adolf Hitler." For the third time in 23 years Baron Mannerheim led his troops against the soviets. On Aug. 30, 1941, the Finns could proclaim the recapture of Viipuri (Viborg), though in sadly devastated condition. Long thrusts into soviet territory were made all along the frontier, but the fortifications of Leningrad could not be pierced.

After Sept. 1941 reports recuired that Finland was about to make a separate peace, and individual Finns declared that their country wanted only the old boundary and would stop fighting when that was reached. Official denials were made repeatedly. Through Washington channels, the U.S.S.R. in mid-August was reported willing to discuss peace with Finland (denied in Moscow). Whether by independent decision or through pressure from Berlin,

the Finnish government clung to its policy; on Nov. 25 Finland signed the anti-Comintern pact with the axis countries; on Nov. 29 Premier J. W. Rangell won a unanimous vote of confidence from the parliament. But by this time soviet appeals and their own interests had brought the British to the point of a declaration of war on Finland (Dec. 6, 1941). U.S. Secretary of State Cordell Hull had warned Finland early in November that it must cease fighting the soviet state or lose U.S. friendship. After the British declaration of war, the U.S. government took into custody six Finnish vessels in its ports.

In the "winter war" of 1939-40 between Finland and the U.S.S.R., the sympathy of the world had been overwhelmingly for Finland. But "Bolshevik Russia" then seemed to be on the side of the nazi aggressors, and had attacked Finland. In the struggle which broke out in June 1941 there was question whether Finland or the U.S.S.R. started the shooting. Certainly Finland had admitted German troops and threatened Leningrad; the essential change was that now the U.S.S.R., Great Britain and the U.S. had been thrown into each other's arms. Yet the Finns thought of themselves as fighting only their own ageold conflict with the Russian bear. They maintained their political institutions intact, they insisted they were only using the Germans to help them; their war, they thought, was a "local war" separate from the clash of the great powers. They could not understand the coldness of the Swedes, the enmity of the British and the growing antagonism of the U.S.-all people with whom the Finns felt especially friendly. Perhaps Finland had not changed; certainly the world had changed.

These Allied states, fighting desperately against the nazi threat, knew that the Finnish conflict was not just a "local war." Great Britain and the U.S. saw the Germans using Finnish air bases from which to attack their convoys to the U.S.S R., and to bomb Murmansk and Archangel; they saw Finnish forces holding thousands of soviet troops in the north when they were needed on the southern front In short, whatever the Finnish attitude, it was obvious that Finland was aiding the enemy of the United Nations, and to many that meant that Finland was itself an enemy. Finland's expansionist talk worried even Sweden. Great Britain had declared war. Through mounting tension the U.S. maintained relations, but closed all Finnish consulates in the U.S. in July 1942 and at the end of December stopped the dissemination of Finnish propaganda. The Finnish legation in Washington, D.C., continued to function, but in Dec. 1942 the U.S. minister to Helsinki, Arthur Schoenfeld, was called home "for consultation." This step may have been influenced by reports that Finnish officials had participated in a celebration of Pearl Harbor day at the Japanese legation in Helsinki.

Finland's war against the U.S.S.R. was continued through 1942 as a holding operation, neither nation making any great effort to change the position. The Finns had conquered Karelia and were attempting to carry on reconstruction work there. Even the front north of Leningrad remained essentially stable. Reports of Finnish troops fighting with the Germans on the Stalingrad front were repeatedly denied, though it was admitted some Finnish volunteers might be there.

Economic and social conditions in Finland were bad, but improving slowly. The cost of living index, based on 100 for Aug. 1939, had reached 164 by June 1942; wage readjustments were prescribed on a regular scale to meet mounting costs, and at the end of the year the government

gave its employees an extra month's pay. Trade had declined disastrously, and needed imports were maintained chiefly by special credit agreements with Sweden and by German shipments of foodstuffs. Twenty-five thousand children were sent to Sweden for varying periods, and 4,400 to Denmark. This eased the problem of relief within the country, as did the resettling of 232,000 of those evicted from Karelia in the "winter war"; 161,000 were not yet reestablished. Petsamo was rebuilt with prefabricated buildings from Sweden.

Food supplies were low; no eggs were available for adults and only two per month for children, but the harvest permitted an increase in general food rations. Great stir was caused by the report of 20,000 deaths among Finns who were soviet prisoners of war.

On the positive side of the ledger were such items as the large oversubscription of a new "Fatherland Loan"; the making of motor fuel from wood, the successful lifting of iron ore from lakes, an unexpectedly high yield from the sales tax, and large increases in crops of vegetables, potatoes and fodder. "Working bees" (the talkoo) helped relieve the labour shortage; and woodchopping became a national sport. Government rewards were given for increased farm production. All schools and colleges were authorized to open in Oct. 1942.

Finland's Dilemma.—As 1943 progressed, however, Finland's position became increasingly desperate. The fiction of a separate war in the north could no longer be argued seriously. Finland was caught in the German vise.

Rumours of Finnish desire for peace and of the issuance of "feelers" became rife. The U.S.S.R. was reported to have made a peace offer to Finland in Jan. 1943. U.S. Undersecretary of State Sumner Welles in February appealed to the Finnish people to pull out of the war. Also in February, Björn Prytz, Swedish minister in London, journeyed hastily to Stockholm, and rumours flew that he was to be intermediary in a Finnish-Russian peace move. Through March and April the rumours gradually died out, and in May a group of U.S. leaders signed a petition for a U.S. declaration of war on Finland. In April all but one U.S. diplomatic officer was removed from Helsinki. In August some 33 Finnish politicians sent to the government a request for peace. At approximately the same time Eero Vuori, chief of the Finnish Trade Union congress, met in Stockholm with Arthur Deakin, official of the British Transport and General Workers union; peace was the issue, but no results showed. Through Sept. and Oct. 1943 suggestions of peace proposals continued. Premier Linkomies in September expressed regret at being at war with Great Britain and hoped that Finland could withdraw from the war with the U.S.S.R. Vaino Tanner, finance minister and ardently antisoviet, made a radio address urging that Finland be realistic and make a "reasonable" peace with the U.S.S.R. But 1943 passed with no agreement, and all that was really sure was that the U.S.S.R. and Finland had not agreed on what was reasonable. Soviet propaganda continued to be as harsh toward the Finns as toward the Germans and pointed out that the Finns, while winning, had seemed quite eager to participate in the results of a Hitler new order.

From a purely military standpoint the war in the north remained a stalemate, with only minor border forays and slight movement. Perhaps Col. Gen. Eduard Dietl and the German forces were concerned largely with their relations with the Finns; and certainly the Finns were not eager to risk increased casualties for futile conquests. The food situation was bad in 1943 but good harvests and 30,000 tons of grain from Germany gave Finland about a six-month supply. Dependence on Germany for supplies may have been the chief factor holding the country to an allegiance of which it had completely sickened. Industrial production dropped, according to Moscow reports, to 35% of normal. Some trade was still carried on with Sweden, and in Dec. 1943 an agreement was signed for the first six months of 1944, providing a Swedish credit of 5,000,000 kronor to Finland for purchases in Sweden. Trade agreements were also negotiated with Germany, Denmark and Spain.

Payment of the much-discussed debt to the U.S. was resumed in June 1943 and in October Finland agreed to a plan to repay the instalments missed in 1941 and 1942 over a period of ten years.

At least 11,000 Ingermans, descendants of Finns who moved some 250 years before to the region southeast of Leningrad, were sent to Finland in 1943 by the Germans, and about 25,000 more were expected. Starvation and hardship had played havoc with these people, but the Finns were glad to welcome their distant kinsfolk.

A presidential election was held on Feb. 15, 1943, resulting in the re-election of Risto Ryti by 269 votes out of 300. On his reinauguration on March 1, the first time any Finnish president had succeeded himself, the cabinet resigned according to custom. The reshuffling, after some delay, brought in as prime minister Edwin Linkomies, Conservative leader, chairman of the editorial board of the Uusi Suomi, and professor at the university. Sir Henrik Ramsay, Finn of Scotch descent, became foreign minister. The former holders of these key posts, J. W. Rangell and Rolf Witting, were probably the strongest pronazis in the cabinet. Marshal Mannerheim remained, at 75 years of age, head of the armies.

On Feb. 8, 1944, U.S. Secretary of State Hull warned Finland in stronger terms than ever that if it continued in its war with the U.S.S.R. it would have to take the consequences. The U.S.S.R. illustrated the threat by bombing Helsinki. Peace discussions soon started, Juho Paasikivi, Finland's negotiator of 1940, going first to Stockholm and later to Moscow for talks. The U.S.S.R., however, demanded an indemnity of \$600,000,000, re-establishment of the 1940 frontiers, and negotiations about cession of the Petsamo area, plus the unequal demand for immediate release of soviet prisoners but soviet release of Finnish prisoners only after completion of the treaty. The Finns were not yet in a mood to accept such humiliating terms.

Gradually the mood changed. The soviets started a general offensive in Karelia and advanced in sweeping successes on their south European fronts. British and U.S. forces landed in Normandy. The German friends of Finland were retiring on every front. On June 16, 1944, the U.S. expelled the once popular Finnish minister in Washington, D.C., Hjalmar Procopé, and four of his aides, for actions "inimical" to the U.S. Eighty-four Finnish firms were blacklisted. In the face of these events, driven by desperation, on June 27 Pres. Ryti made a special agreement with Joachim von Ribbentrop, who went to Helsinki, by which Ryti promised that Finland would continue fighting, and in return for which pledge a few additional German troops were sent to Finland. This agreement was the last straw for the U.S., and on June 30 Secretary Hull

broke off diplomatic relations with Finland.

The Second Humiliating Peace.—The Finnish people wished peace, and Marshal Mannerheim was convinced that the army could no longer stand against soviet power. Thus, on Aug. 1, 1944, the pro-German Pres. Ryti was forced to resign, and parliament at once asked Mannerheim to become president. Out with Ryti, of course, went Premier Edwin Linkomies and Foreign Minister Sir Henrik Ramsay. Antti Hackzell became premier, and he soon announced that the June agreement was only a personal pledge of Ryti to von Ribbentrop, hence not legally binding. A new approach was made to the U.S.S.R.; on Sept. 2 relations with Germany were severed and German armies were given until Sept. 15 to evacuate Finland. The peace treaty signed by Finland with Great Britain and the U.S.S.R. in Moscow on Sept. 19 provided:

- (1) Aerodrome and port facilities in Finland were to be extended to the Allies during their war against Germany;
- (2) German forces in Finland after Sept. 15, 1944, were to be handed over as war prisoners; the U.S.S.R. would assist Finland to effect this action;
- (3) Finland promised to break relations with Germany's satellites and to suppress organizations hostile to the United Nations, "in particular to the soviet union;"
- (4) The frontier of 1940 was to be re-established with some modifications (the U.S.S.R. received the Petsamo region, thus shutting off Finland from the Arctic ocean; the U.S.S.R. gave up its lease on Hanko peninsula for similar privileges for a naval base in the Porkkala-Udd area near Helsinki);
- (5) Finland was to pay in five years an indemnity of \$300,000,000 in produce to the U.S.S.R. (this was half of the first demand, but still heavy for a country whose total foreign trade in 1938 was only \$365,575,000).

Bitter conflict followed with Col. Gen. Lothar Rendulic and his Germans, who committed much destruction as they retreated into northern Norway. The Finns pressed from the south, up through Tornio and Rovaniemi, on Nov. 22 reaching the Norwegian border in the north. The soviets came in from the sea, captured Petsamo in mid-October, and chased the Germans some 75 mi. westward, then left them to the problems of cold and distance and the hostile Norwegians.

The Allied Control commission in Finland included some British, but was naturally dominated by the soviets, of whom Col. Gen. A. A. Zhdanov was the chief. The soviets announced a list of about 60 Finnish war criminals, mostly officials of the Finnish occupation of Karelia.

Circumstances naturally accentuated political tensions, and governmental changes were frequent. Premier Hackzell became ill during the Moscow negotiations and was succeeded by Urho J. Castrén. In early November 1944 the former finance minister, Väinö Tanner, it appeared, caused a cabinet crisis which resulted in a complete reshuffling. Whether or not the assassination of two soviet officials in Helsinki had any connection with the crisis was not clear. The new cabinet was headed by Juho K. Paasikivi, and included for the first time a communist as assistant secretary of labour-Yrjo Leino. Eero Vuori became minister of labour and Carl Enckell became foreign minister. Ten of the cabinet members were new, and seven were directors of the newly established Finland Soviet association. The Finnish government was trying hard to build good relations with its powerful neighbour.

Sweden granted Finland a reconstruction credit of \$35,000,000 for purchases in Sweden after the peace was

signed. The December instalment on the famous Finnish debt to the U.S. was refused by the U.S. treasury because Finland was still officially axis territory and its funds were frozen. On the last day of the year Pres. Mannerheim relinquished his supreme military command and appealed for general co-operation in the peaceful reconstruction of Finland.

Evidently to facilitate soviet use of Finnish bases, Finland formally declared war on Germany on March 3, 1945, announcing then that a state of war had actually existed from Sept. 15, 1944, when German forces attacked the island of Hogland.

Attempt at Reconstruction.-Political reorganization was difficult, but seemed to progress "as well as could be expected" under the firm and farsighted guidance of Premier Paasikivi. The premier's basic policy was one of friendly co-operation with the U.S.S.R. within a framework of Finnish independence. Elections to the 200-member unicameral parliament were held on March 17 and 18, with a considerable change from 1939 in the party lineup. The left gained at the expense of the right, and the formerly predominant Social Democrats lost many seats to the coalition called Popular Democrats (40 of whose 49 deputies were communists). Even then the total vote amassed by the right was about 732,000 as against 711,000 for the left. The Finnish nazi party (formerly holding eight seats) was banned from the elections, and a number of the former antisoviet leaders like Väinö A. Tanner, Edwin Linkomies, Henrik Ramsay and Tyko Reinikka, did not stand for election. The two days of voting were ushered in by Paasikivi's warning that it was not enough merely to observe the letter of the armistice with Moscow, and that the elections were the supreme opportunity for Finland to prove its intentions. The results gave: Social Democrats (anti-Moscow) 50 seats, a loss of 35; Popular Democrats (pro-Moscow) 49 seats; Agrarians 48 seats, a loss of nine; Conservatives 29 seats, a gain of two; Swedish Peoples' party 16 seats, a loss of two; Liberals (or Progressives) 7 seats.

The cabinet resigned after the elections, as was usual, but Paasikivi retained his position in a new-formed government, which included Foreign Minister Carl J. A. Enckell (nonparty); Minister of Finance M. Tuomija (Liberal); Minister of the Interior Yrjo Leino (communist). The total cabinet contained four communists, four Social Democrats, two Popular Democrats, four Agrarians, two nonparty and one Swedish Peoples' party.

The soviets appeared pleased at the trend of the elections, but they had taken no visible part in the campaign. Everything indicated that they were quite ready to let the Finns make their own decisions—and be responsible for their actions. In a speech on April 7, 1945, at the opening of the new parliament, Pres. Mannerheim called for "lasting, friendly relations, founded on common interests and mutual confidence, with the soviet union" and for a complete reform of Finnish agriculture.

The armistice terms bore heavily on Finland, and inevitably resentment expressed itself. Some of the opposition was natural and innocent, but more serious tensions were indicated by the arrest of 34 Finnish general staff officers in July, 1945, for storing of arms and sabotage of the armistice. In September some 200 arrests were made and "second officers" of the general staff were rumoured to be implicated in a plot involving storage of arms in each of Finland's former "protective corps" districts. Early in August the soviets relaxed some of the restraints on Finnish shipping and travel, and new hope arose. However, in October two new demands for reparations created

despondency: \$15,000,000 payment for German assets in Finland, and \$14,000,000 for damage inflicted by the Finns during the occupation of Karelia, both payments to be made in 1946. This burden, added to the \$50,000,000 annual payment on the \$300,000,000 agreed on in 1944, had to come from a country with depleted resources, few ships and with small chance of remunerative trade. Payments had to be made in specific categories of goods with fines for delays. The fact that payments had to be made in kind actually worked out to a doubling (in current values) of the monetary figure of reparations, and thus to a still tighter channelling of all Finnish exports to the U.S.S.R. Under these circumstances the political freedom carefully left to the Finns was of slight satisfaction.

Following the soviet lead (Aug. 7, 1945), Great Britain and the U.S. resumed diplomatic relations with Finland (resumption of U.S. relations with Finland dated officially from Sept. 1). Since the U.S.S.R. and Great Britain were the chief Allies at war with Finland, they alone negotiated the armistice and maintained the control commission in Helsinki. The London conference of foreign ministers failed to reach agreements on implementing the peace, but the conference in Moscow in December opened the way for negotiation of the definitive peace treaty.

Restoration of trade relations with the west was

attempted; an agreement with Great Britain, beginning Aug. 17, 1945, and continuing to June 30, 1947, permitted normal trade and financial transactions. Some export of pulpwood to the U.S. was resumed in the late fall, and the U.S. Export-Import bank on Dec. 13 granted a 15-month credit of \$5,000,000 for Finnish purchase of U.S. cotton. British agents were reported vigorously pushing trade on a credit basis.

The prosecution of war criminals was perhaps more difficult in Finland than in most countries, for it was hard to separate war criminals, war culprits and the various others who were merely antisoviet or anticommunist. Early in 1945 an investigating committee had been set up under the chairmanship of Dr. Erik Hornborg. The trials got under way only in mid-November, after much prodding by the control commission, and the passage of a law by the Diet (Sept. 11) providing for punishment of those responsible for taking the country into war on the German side. On Nov. 6 eight men were dramatically arrested and on the 15th were brought to trial: Risto Ryti, president; Edwin Linkomies, premier; Johan W. Rangell, premier; V. A. Tanner, minister of finance and head of Social Democratic party; Tyko Reinikka, minister of finance; Henrik Ramsay, minister of foreign affairs; Antti Kukkonen,

Finland, Statistical Data

minister of interior; Toivo Kivimaeki, minister to Berlin.

The first sentences of the Finnish supreme court were too light to satisfy Gen. Zhdanov and the control commission, and had to be revised. As announced on Feb. 21 the final verdict levied on Ryti a ten-year term at hard labour; Tanner, five and a half years; Rangell, six years; Kivimaeki, five years; Ramsay, two and a half years; Kukkonen and Reinikka, two years each.

Pres. Mannerheim, who had not been involved in the trials, was 79 years old and ill; all the soviet demands except for reparations had been fulfilled; he felt that he could retire. On March 4, 1946, he submitted his resignation, and the cabinet was obliged to accept it, recommending that the Diet elect a successor to fill out the term. Although he left office in a time of national tragedy, he stood in bold relief as the great man of Finland's period of independence.

The Diet, 159 to 14, quickly elected the premier, nonparty Juho K. Paasikivi (75), who had so often negotiated with the soviets. He had first sat in the Finnish diet in 1907, when Finland was a Russian grand duchy, and had held a variety of high posts for nearly 40 years. He took the oath of office March 11 and then had to find a premier to succeed himself. After considerable difficulties Mauno Pekkala, former defense minister, formed a cabinet (March 24). Carl J. H. Enckell, an Independent, remained as foreign minister, six ministers were from the Popular Democratic party, which included the Communists, five were Social Democrats, five Agrarians and one of the Swedish party. It was more leftist than Paasikivi's cabinet. Incidentally, the Social Democratic party seemed to be guided still by Vainö Tanner, from his jail cell, but the soviets seemed fairly well satisfied with the whole situation.

The Finns sent a strong delegation to the peace conference in Paris, and tried to obtain amelioration of the terms of the peace treaty with the U.S.S.R. Hope was not high, and it was known that the soviet naval base at Porkkala-Udd and the taking over of Petsamo were faits accomplis. The Finns hoped for reduction of the \$300,000,000 reparations bill, and they pushed vigorously for the privilege of using the Saimaa canal. But the Finnish treaty commission at Paris left things as they were, and the only hope for any modifications appeared to lie in direct negotiations with the soviet union.

Economic conditions were bad, yet the Finns, inured to misfortune, were making real recovery. The rubble of bombings was cleared away in Helsinki, houses were being built to care for the homeless Karelians and others and reparations payments were kept up to date. A U.S. credit of \$35,000,000 was granted by the Export-Import bank, trade was maintained with Sweden and a trade treaty was negotiated with the U.S.S.R. in May 1946. The latter provided that Finland send the U.S.S.R. prefabricated houses, copper, etc., and that the U.S.S.R. send Finland grain, animal foodstuffs and some raw materials. Herbert Hoover, on his visit to Helsinki April 1, found food supplies dangerously low. But the Finns thought they could get along and were more interested in raw materials and machinery for industrial production than in increased food imports. In August 1946 it was decreed that Finnish citizens must turn over to the Bank of Finland shares and bonds in foreign firms, to give the government foreign purchasing power. The Finns were using every means available to rebuild their strength.

Fire Insurance

See INSURANCE.

Fires and Fire Losses

Fire losses in the United States in 1946 were more than double the 1937 figure, and each year after 1937 showed an increase over the preceding one. The National Board of Fire Underwriters estimate of 1946 losses, including those unreported and uninsured, was \$561,487,000 as against its 1937 aggregate loss figure of \$254.959,423.

For the decade 1937–46 the losses were as follows: 1937, \$254,959,423; 1938, \$258,477,944; 1939, \$275,102,119; 1940, \$285,878,697; 1941, \$303,895,000; 1942, \$314,295,000; 1943, \$373,000,000; 1944, \$437,273,000; 1945, \$484,274,000; 1946, \$561,487,000.

Much of the decade's huge increase in fire losses could be laid to the marked rise in the aggregate value of goods subject to the risk of fire. Part of this increased value was due to more goods being in existence and part to the inflationary price trend. However, even assuming a stationary level of values throughout the ten years, fire losses would still have shown a substantial increase, probably about 50%.

Unlike the dollar volume of fire losses, this adjusted figure, after a gradual rise in 1937—40 inclusive, showed a substantial improvement in 1941 and 1942. It climbed sharply in the next two years, however, and somewhat less steeply in 1945 and 1946.

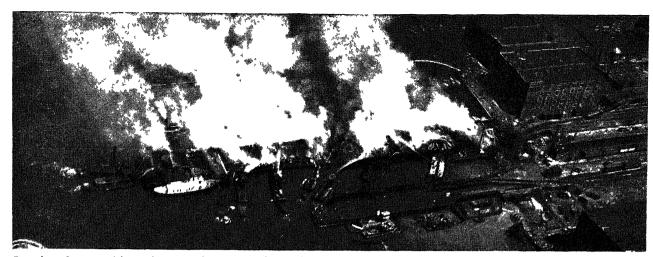

The number of fire losses, which had been going up, appeared to have levelled off about the end of 1943. It was not clear whether the peak in number of losses had been reached or whether there had been merely a pause in the upward trend. A major reason why the cost of fire losses continued upward so sharply despite the decline in the number of fires appeared to be the great increase in the number of large fires—those causing a loss of \$250,000 or more. In 1940, a fairly typical year, there were 34 fires in which the estimate of loss exceeded \$250,000. The number increased each year until by 1945 there were 144 fires in the \$250,000 category. Also, the 34 such fires occurring in 1940 represented about 6% of the total fire loss whereas the 144 \$250,000 fires of 1945 accounted for more than 22% of the year's total fire loss.

While the spectacular increase was among the large fires, the records showed that no category—manufacturing, mercantile, residential, accessible to fire department protection or not—succeeded in escaping the increase in fire losses.

Despite the mounting property losses caused by fire, it took the shocking death toll from three hotel fires of 1946 to arouse the nation to the seriousness of the fire hazard; these three were the Hotel LaSalle in Chicago, Ill., the Canfield hotel in Dubuque, Iowa, and the Winecoff hotel in Atlanta, Ga. One result was intensive agitation for retroactive building codes requiring enclosure of clevator shafts, stair wells and other vertical openings between floors. Another was the calling by President Harry Truman of a conference "to bring the ever present danger from fire home to all our people and to intensify the work of fire prevention in every town and city in the nation," as the White House announcement phrased it.

(R. B. Ml.)

British Losses.—The most spectacular fire damage in Great Britain during 1937–46 was the damage resulting from German air attack. Incendiary bombs caused great

Five-alarm fire started by explosions in the cargo of the freighter "Panuco" spread rapidly through a large Brooklyn pier Aug. 18, 1941, and killed more than 30 longshoremen and sailors

destruction, the worst effects being felt in the city of London, where a large area containing much of London's historical and architectural treasure was reduced to ashes. Excluding fires caused by air raids, there were no major conflagrations; outbreaks of fire continued nevertheless to menace life and property and to handicap human effort.

Government departments as well as private and voluntary institutions had attacked the problem of minimizing fire wastage after 1937. The Fire Brigades act, 1938, compelled all local authorities to establish efficient fire-fighting services under government supervision; and unification was achieved in 1941, when a strict central control was imposed, and the national fire service replaced the locally-administered brigades. At the end of World War II control tended to revert to the local authorities; but centralized instruction remained, and the state continued to see that the prescribed standards of efficiency were maintained.

Probably the most practical efforts to reduce fire wastage were made at the fire offices committee's testing station at Elstree. The unique technical service provided there proved of great help to the home office, service departments and other ministries during World War II, as well as to the industrial and commercial interests originally served. Research and experimental work in the combustibility of building materials and elements of structure continued at Elstree; sprinklers, chemical extinguishers and fire alarms were tested, and all aspects of fire prevention and extinguishment were studied exhaustively.

The problem was attacked from another angle in 1942 when the fire offices, with full government approval, launched a publicity campaign against carelessness as a cause of fire. Arresting posters and attractive newspaper advertisements, films and radio talks were all employed to draw the layman's attention for the first time to fire wastage; and all that could be done to awaken the public conscience to the fire peril had been done by the time the campaign had ended in 1945. The Factories act, 1937, also helped to minimize fire losses in applying statutory rules and orders to certain hazardous trades; and the vigilance of fire-insurance surveyors, working harmoniously with the factory department of the home office, played its part. Unfortunately the results of all these efforts to restrict fire wastage were disappointing. In Dec. 1946 a new venture was announced: a fire research organization was to be set up to investigate methods of preventing and fighting fires and to conduct research on the protection of buildings, aircraft, ships and special industrial hazards. It was to be a joint undertaking by science, industry and the state, the expense equally shared by government and industry.

The cost of home fire losses was difficult to estimate, since the insurance offices' published accounts did not separate home and foreign figures.

According to estimates published in the *Times*, the yearly average cost of fire losses for the six years ending 1945 worked out at £11,500,000 against £9,500,000 for the preceding six years. Direct fire and damage in Great Britain and Eire amounted to £12,800,000 in 1945, the heaviest wastage after 1920. In 1946 it was estimated to be £12,047,000.

World War II contributed much to the increased cost of fire losses. Machinery was overworked and madequately maintained; unskilled operatives replaced workers drafted into the services; new factories were built without efficient sprinkler protection; and inflammable goods were concentrated in unsuitable storage places. The human element also entered into it; war strain led to widespread carelessness and irresponsibility, and there was a great increase in illicit cigarette smoking, especially among women workers.

Agricultural losses were particularly heavy, notably in Scotland; the cause was probably intensive farming leading to bulk storage in unsuitable locations. Stacks of agricultural produce suffered severely, frequently through their being crowded together, for convenience of transport, near public highways or railways.

Causes of fire during 1936-47 reflected the increased use of electricity. Electrical breakdown in radio sets, refrigerators and other domestic equipment caused many fires, and portable electric heaters figured all too frequently in analyses of causes.

But the most frequent cause of fire remained, as ever, carelessness, particularly the careless disposal of cigarette ends and unextinguished matches. (See also DISASTERS.)

Fisher, Geoffrey Francis

The 97th archbishop of Canterbury (1887—) was born May 5, 1887, the youngest son of the Rev. H. Fisher, rector of Higham-on-the-Hill, Nuneaton, England. The primate of all England was educated at Marlborough and at Exeter college, Oxford, and, after a short period of training at Wells theological college, became an assistant master at Marlborough in 1911. He was ordained deacon

346 at Salisbury in 1912 and a priest in 1913. In 1914 he was appointed headmaster of Repton school, in Derbyshire. In 1917 he married Rosamond Chevallier, granddaughter of Dr. S. A. Pears, a former head of Repton. He was consecrated bishop of Chester in 1932 and bishop of London in 1939. As chairman of the executive committee of the British Council of Churches, he was active in the movement for inter-denominational understanding and cooperation. He was also recognized as a conservative and able church administrator. On April 19, 1945, he succeeded William Temple as archbishop of Canterbury.

Fisheries

The estimated production of the world's commercial fisheries at the beginning of the period 1937-46 was approximately 18,500,000 tons, with a value of about \$762,-000,000. This figure was exclusive of whale products, and of an estimated 1,000,000 tons produced by subsistence fishing, angling and unrecorded commercial production.

To an overwhelming degree, the northern hemisphere led in fishery production, yielding 98% of the total tonnage. Of the world yield, 46% came from the waters of the North Atlantic and 47% from the North Pacific. Considered by continents, Asia, with its extremely long coast line, furnished 49% of the total production, Europe 32%, North America 16% and other countries 3%.

The leading fishery nations of the world, from the standpoint of the volume of their production, were Japan, the United States and Alaska, the soviet union and China. These countries collectively provided about one-half of the world's total production.

From the standpoint of the percentage of national energy going into fishing, however, Iceland was the leading fishery nation. The per capita production of fish in Iceland was 6,223 lb., in Newfoundland 1,525 lb., in Norway 680 lb. and in Japan 111 lb.

The species of principal commercial importance varied from country to country, but in general the marine fisheries of the world were based on three great groups of fishes: the bottom-living or ground fishes, including cod, haddock, halibut, hake, cusk and pollock; the surfaceliving or pelagic fishes such as the sea herring, pılchards, mackerels, tunas, anchovies and menhadens and the anadromous species that migrate from salt water into coastal rivers to spawn-the salmons, smelt, alewives and shad.

Operations Curtailed by War.-The relation of World War II to the fisheries was so direct and immediate that it dominated the entire period under consideration. It was a two-way relationship. On the one hand the conflict imposed tremendous handicaps on the conduct of fishing; on the other, despite all difficulties, the fisheries made contributions of food and materials which played an indispensable part in the conduct of the war.

Almost from the beginning of the conflict the principal European fishing grounds such as those in the North sea became the scene of bombings and torpedoings. Wherever hshing craft could operate, they did so at great hazard Most of the trawling grounds of the North sea, as well as productive grounds in the Mediterranean, were virtually closed to fishing during the greater part of the war. In all nations, the largest fishing boats were converted to military use, serving as transports, freighters, mine sweepers and the like. In countries like Denmark and Norway, under German occupation, fishing was carried on where possible with the small vessels remaining. But in France, the Netherlands, and Belgium the fishing industry, including shore facilities as well as vessels, was all but destroyed. In the Netherlands, for example, only 12 trawlers were left intact out of a considerable prewar fishing fleet.

Although the United States was spared direct attack upon its fishing ports, submarine warfare invaded many of the grounds familiar to U.S. vessels. For security reasons, the far-ranging tuna clippers were barred from the highly productive grounds about the Galapagos Islands. Salmon fishing had to be suspended in Bristol bay in Alaska in 1942 because of Japanese activity in the Aleutians. Since this remote area supplied the principal pack of red salmon, production of this valuable food was directly affected. On the western Atlantic coast, and especially on the New England and Nova Scotian fishing banks, the possibility of attack by submarine was a constant threat.

A less spectacular but far reaching impediment to fishery production was illustrated by events in the United States. Immediately upon the entrance of that nation into World War II, about 700 fishing boats were requisitioned by the army and navy. These boats included the largest and fastest units of the fishing fleet. For the most part, they belonged to segments of the fishing industry that normally produced the heaviest poundage-the salmon, pilchard, tuna, menhaden and New England vessel fisheries. This transfer of boats to the military services continued throughout much of 1942. Its effect on production was most sharply felt during the latter half of that year and in 1943. The diversion of even one of the larger vessels from fishing meant a decline of 5,000,000 lb. to 7,000,000 lb. in the catch. It was estimated that the aggregate effect of the loss of fishing vessels was a decline of approximately 1,000,-000,000 lb. in total production.

Some of the requisitioned vessels were returned in 1943. others in 1944. A program of new construction, however, was chiefly responsible for restoring the productive capacity of the fleet to approximately prewar levels by the spring of

Not only boats, but all the materials used by fishermen were needed for war. Netting was required for camouflage and for cargo nets; hence for many months the normal re-

Fishermen unloading a herring catch on the west coast of the U.S. in 1944. Formerly used largely as bait or converted to fertilizer, herring went chiefly to food markets in war years

placements for worn-out fishing gear could not be had. Manila for any purpose was scarce, the Philippines having been the principal source of this fibre. Engines for small fishing boats were also suitable for landing craft, and until military needs had been met the industry could not be supplied.

Despite these handicaps, production was maintained at a fairly high level except for the sharp decline that occurred in the first year of the war. From the normal peacetime production of about 4,400,000,000 lb., the catch fell to 3,700,000,000 lb. in 1942. In 1943, however, it rose to 4,000,000,000 lb., and in 1944 to 4,300,000,000 lb., remaining at approximately this level in 1945 and 1946.

Effect of War on World Trade.—Apart from its immediate and drastic impact on the operation of fisheries, the war induced many far-reaching changes with ramifications extending to almost every nation having important fishing industries. Some of these changes set in motion a chain of economic consequences that continued into the postwar period.

Great Britain, for example, was unable to maintain its normal production of fish; its fishing boats were widely occupied in war service and operation on the accustomed grounds was hazardous (see below). Accordingly, it turned to nations of the western Atlantic for greatly increased imports. This induced Canada and the United States to attempt by every possible means to increase their production of canned fish, and to obtain larger allotments for export by restricting consumption of this commodity by their civilians. It induced such countries as Newfoundland and Iceland to expand their facilities for filleting and freezing fish so greatly that virtually new industries were created. The traditional method of fish processing in these two countries had been by salting prior to World War II. This was largely abandoned in favour of freezing. As the production of salt fish declined, the Caribbean and Mediterranean countries, in whose diet salt fish is a staple item, experienced extreme difficulty in obtaining large enough imports to meet their needs. The countries of the West Indies in particular suffered from an inadequate quantity of salt fish. Attracted by this potential market, some South American countries such as Peru, which hitherto had not developed a large fishing industry, began attempts to stimulate fishing and especially the production of salt fish.

The end of the war found Iceland with a completely altered fishery economy, having become one of the principal producers of frozen fish fillets in the world. To a considerable extent, the balance of production in Newfoundland also had shifted from salt to frozen fish. With this huge new supply in the world markets, the economy of other nations was affected accordingly. Imports of trozen groundfish fillets into the United States from Iceland rose from 13,000 lb. in 1939 to 1,402,000 lb. in 1945. Imports from Newfoundland during the same period rose from 46,000 lb. to 3,938,000 lb. Despite these developments, fishery experts at the close of the war looked for some revival of the salt fish industry and predicted that salting might again become one of the principal methods of processing fish to supply needed animal protein at low cost to local peoples.

Wartime interference with the accustomed flow of fishery products in world trade had other effects, such as the development of an intensive fishery for sharks in the United States as a means of supplying the demand for vitamin A oils, formerly imported in large quantity from Norway. Following the discovery by Canadian scientists in 1927 that the liver of the dogfish (a small shark) has a vitamin A potency five to ten times as great as that of the standard

grade of cod liver oil, a small fishery for sharks was begun in the United States in 1936. About 1938 it was discovered that the liver of the soupfin shark far exceeds even that of the dogfish in potency of vitamin A. As a result, the new fishery grew so rapidly that landings increased from 2,500,000 lb. in 1937 to 40,000,000 lb. in 1941. In 1944 the fish and wildlife service reported that "no fishery in America has ever increased with such rapidity as that for the soupfin shark. Only a few years ago the value to fishermen of all sharks taken was about \$500,000 a year. It is estimated that sharks were worth more than \$8,500,000 to fishermen in 1943."

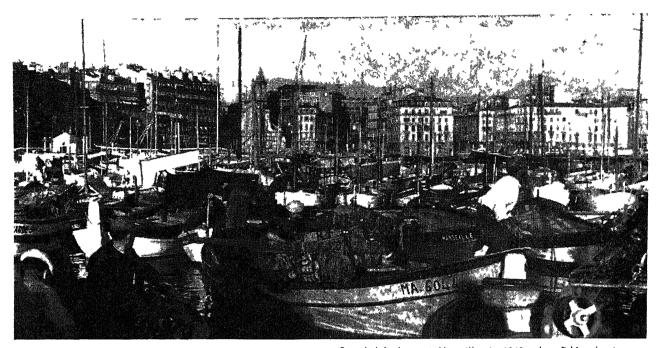

A decline in the production of soupfin shark became apparent during 1944, continuing into 1945 and 1946. Conservationists viewed the situation with some apprehension, believing that intensive fishing, carried on under the stress of war and without the guidance of any knowledge of the biological requirements of the sharks, had already brought about depletion of the resource.

Because of the unprecedented wartime demand for fishery products, coupled with shortage of labour and materials for maintaining production, certain kinds of fish formerly rejected by consumers were utilized during the war years. The Technical Committee on Fisheries, reporting to the United Nations Interim Commission on Food and Agriculture on April 13, 1945, said: "Quantities of fresh, frozen, and dry-salted shark meat are now used for human consumption, and vitamin A concentrates from shark-liver oils have been used to fortify foods. It was demonstrated that menhaden (a herringlike fish) could be prepared as an appetizing canned product while large sea herring, formerly not canned to any extent, were now so prepared in great quantities. Other new developments in the canning industry included the packing of sardines in tall instead of flat containers with greater economy of labour; the preparation of acceptable new canned products from the waste portions of salmon formerly discarded in cannery operations; and the development of an excellent quality of canned fish flake from lake carp. . . . It may well be that preference for these products will develop and continue during the postwar years, thus bringing about greater utilization of fishery products."2

Technological Progress.—Although the decade 1937–46 was not marked by the development of any revolutionary new method of fishing, such as the rise of otter trawling in the 1920s, it saw the adoption by the industry of many mechanical improvements. The net effect was marked progress in the modernization of the industry.

A strong tendency toward making the fishing vessel largely independent of the shore station was evident. This took the form of installing freezing, refrigerating and other processing equipment aboard ship, so that vessels were able to remain at sea for a longer period and to go farther afield. Freezing and refrigerating machinery became standard equipment aboard the tuna clippers operating on the Pacific coast. So equipped, these boats were able to remain at sea for several months and at the completion of their voyages deliver a cargo of frozen tuna to the canneries. Floating canneries operated in the California pilchard fishery for a short period, and a few such vessels were operated in the Alaska salmon fishery. In 1943 the Pacific otter trawler "Soupfin" pioneered in the filleting and freezing of ground fish (such as flounders)

¹United States Department of the Interior press release, April 10, 1944 ²Five Technical Reports on Food and Agriculture, submitted to the United Nations Interim Commission on Food and Agriculture by its Technical Committees on Nutrition and Food Management, p. 204, (Aug. 20, 1945).

Crowded harbour at Marseilles in 1942, when fishing boats were port-bound for lack of gasoline. Fishery output was reduced to a fraction of normal

while at sea. In 1946 plans were under way for at least two expeditions by United States vessels involving the joint operation of a factory ship with a fleet of trawlers. Several other nations had such units in operation in 1946. All of these developments were widely interpreted to mean the setting in of a strong postwar trend resulting in a wider ranging of the seas by fishing boats and a general improvement in the quality of the fish brought into port.

Automatic sounding apparatus was in wide use by fishing vessels. These devices utilized the principle of measuring the time required for sound waves generated aboard the vessel to reach the bottom and return to a receiving instrument. They made possible a continuous and instantaneous recording of the depth of water beneath the keel, contributing greatly to the safety of navigation.

Probably the first attempt to use these sounding instruments to detect schools of fish was made in the 1920s, but intensive interest in such applications was delayed for a decade or more. Herring were experimentally located with an echo sounder in British Columbia waters about 1939, and sardine seiners off the Maine coast reported success in locating fish by this method on a practical, commercial scale.

World War II, however, brought the perfection of infinitely more sensitive and flexible sounding devices. These instruments, developed for the detection of submarines, added the further advantage of being able to search the water on all sides of the ship, in addition to areas directly beneath the keel. During the war, despite the necessity for military secrecy, the United States navy permitted scientific observers of the fish and wildlife service to test the utility of some of these sonic devices in detecting schools of fish. These tests were extended in 1946, when the sardine industry chartered a vessel equipped with "sonar." Preliminary results of this experiment indicated that it was entirely feasible to locate schools of fish, even though they were too far below the surface to be detected by ordinary means. Early tests did not, however, disclose a means of distinguishing between pilchards and the smaller anchovies, which in 1946 had little commercial value in the U.S.

Conservation.—In some respects, conservation of the fishery resources of the world suffered a severe setback as a

result of the war. Because of the acute need for a large and immediate increase in production, some nations felt constrained to relax or abandon conservation measures already in effect. Several international organizations whose efforts had been directed to promoting conservation of marine resources were obliged to become relatively or completely inactive for the duration of the war. Among these were the Conseil Permanent International pour l'Exploration de la Mer, the North American Council on Fishery Investigations and the Conseil International pour l'Exploration de la Mer Méditerranée.

Despite these obstacles, the decade was remarkable for the number of treaties and agreements concluded or put into effect for the conservation of marine resources.

A treaty for the conservation of the Pacific halibut was concluded between the United States and Canada in 1937. Through the instrumentality of this and a previous treaty, the International Fisheries commission was established as a regulatory body with jurisdiction over the Pacific halibut fisheries off the coasts of Alaska, Canada and the United States. Through its control of the seasons, places and intensity of halibut fishing, the commission succeeded by the late 1930s in restoring the seriously depleted halibut fishery to productive levels.

Another body with powers to investigate and regulate a fishery prosecuted by more than one nation was the International Pacific Salmon Fisheries commission, established by a treaty between the United States and Canada. The treaty received final ratification in 1937. Its object was the restoration and conservation of the sockeye salmon fisheries of the Fraser river.

During the period 1937-46 several international conferences were held to strengthen and extend already existing treaties for the conservation of the dwindling whale resources of the world. The resulting conventions and subsequent amendments provided an international co-operative method of regulating the capture and processing of whales throughout the world. Despite these efforts, whales were considered by the close of the period under consideration to have come perilously near to extinction.

A treaty for the development, protection and conservation of the seriously depleted Great Lakes fisheries was signed on behalf of Canada and the United States on April 2, 1946, but awaited ratification by the Canadian parliament and the United States senate. Also awaiting ratification was an international convention adopted in London in April 1946, by representatives of 14 European nations, relating to the problem of overfishing in the North sea and other waters adjacent to the British Isles. (See below.)

On the negative side, an international treaty for the conservation of the fur seals of the North Pacific ocean, to which the United States, Canada, the U.S.S.R. and Japan were signatories, was abrogated by Japan on Oct. 23, 1940. Thereafter, the United States and Canada concluded an interim agreement which maintained the provisions of the 1911 treaty insofar as the nationals of the two countries were concerned. The soviet union was not a signatory to this provisional agreement, but continued to follow the stipulations of the original treaty. It was anticipated that a new treaty would be formulated as soon as world conditions should permit.

The right and intent of the United States, unilaterally or by international agreement, to establish conservation zones in certain areas of the high seas and to regulate fishing therein when necessary, was asserted in a proclamation of the president of the United States on Sept. 28, 1945. The president of Mexico issued a similar proclamation on Oct. 29, 1945.

The British Industry.—The opening years of the decade 1937-46 saw the British fishing industry in an unsettled and in many ways depressed state. The opening up of the distant fishing grounds in the far north around Bear Island and elsewhere had resulted in the flooding of the market with cheap cod. Prices were depressed all around. The owners of the distant water vessels had for their own protection to lay some of them up and to limit the catch of the remainder. The near- and middle-water trawlers were fishing at a heavy loss, while the inshore men, affected by the falling prices, were not making a living wage, and the process of the drift from the fishing industry to other industries went on apace. As regards the great herring fisheries, the difficulty of securing foreign markets for all the supplies caught showed no sign of being successfully surmounted. Such was the state of affairs in the summer of

Few industries are so vitally or directly affected by war operations as that relating to fisheries, especially where an island race is concerned that not only depends on the harvest of the sea as an essential part of its food supply but also has to depend on the personnel of the industry as a reservoir for manning its navy.

The extent to which the British fishing industry was affected could be appreciated from the following figures. In 1939 the deep sea trawling fleet of Great Britain, which in peacetime caught anything up to 95% of the nation's fish supply, other than herrings and other pelagic fish, was some 1,472 strong, of which 1,030 operated from English

and Welsh as distinct from Scottish ports. Many of these vessels were of considerable age on the outbreak of World War II, mainly owing to the depression which had overtaken the section of the fleet known as the near- and middle-water fleet that fished comparatively near waters like the North sea. On the other hand, there was a fine fleet of about 250 distant water trawlers at Hull with about 50 more at Grimsby, many of which were of the latest type, designed to go to Bear island and the far north, and capable of staying out for 30 days or more. It was hardly surprising, therefore, that even before the actual outbreak of World War II, the admiralty set about purchasing nearly 100 of the most up-to-date trawlers as being highly suitable for anti-submarine, minesweeping and other operations. Then, when war broke out, requisitioning became the order of the day and continued up to the end of the conflict. In fact, it ceased only because every vessel that could be used for naval service had been taken. Altogether more than 1,000 vessels were either purchased or requisitioned at one time or another out of the British trawling fleet, and the small number of trawlers still left fishing were mostly antiquated crocks that in peacetime would have hardly been allowed to go to sea. The steam-drifter fleet for herrings and other pelagic fish was reduced from 662 to fewer than 200.

Finally, about 90 English and Welsh inshore boats were taken, and in Scotland about 235. As, however, in England and Wales the catch of these little vessels in normal times was less than 5% of the total whitefish catch, the effect on the food supply was comparatively slight, although every pound of fish was of value.

The real loss to the food supply was in whitefish. Even if the herring fleet of drifters, steam and motor, had not been materially decreased, it is doubtful whether they would have been able to continue fishing since so many of the herring fishing areas were closed to fishing. The herring shoals are found all round the British coasts, but perhaps the most important grounds are off the east coast, where the fleets normally work from north to south, ending with the great East Anglian season from Great Yarmouth and Lowestoft that starts in October.

It was only in the first year of the war that the East Anglian season was possible and then only on a greatly reduced scale.

A mine belt was established right down the east coast at varying distances from the coast up to 30 mi., but much of this mine belt lay right across the herring grounds, and even where it did not do so there was scarcely enough room for the fishing to be carried on without interfering with the convoys and shipping that plied unceasingly up and down the coast.

Apart from this, however, in normal times more than 50% of the herring catch of some 5,000,000 cwt. was exported in pickled or cured form to countries like Germany, Poland and Russia, so that the reduced total catch was sufficient to meet a large part of the requirements of the home consumer, whether in the form of fresh herrings, bloaters or kippers.

No fewer than 383 trawlers were lost from those either on admiralty service or still left fishing, and at one time in the war years the total number of trawlers left fishing was only about 370, and as these were of the oldest vintage, they could only keep on fishing with their aged crews by the aid of heavy and long-drawn-out repairs which restricted greatly their fishing time at sea. Of the crews of vessels still left fishing, no fewer than 827 men (including

88 skippers) lost their lives. It was no easy or unhazardous task to bring fish supplies to the waiting queues of housewives.

A number of vessels from France, Belgium, Denmark, the Netherlands and Norway sought refuge in British ports and fished from them to the great advantage of the British food supply; with a few exceptions all these vessels returned to their home ports toward the end of 1945 and in the early months of 1946.

Apart from the above, the only foreign fishing vessels which continued to land fish in Great Britain in any quantity during the war were Icelandic and Faroese. Iceland had a prewar quota of 250,000 cwt. of fresh fish, but throughout the war years succeeded in landing either direct from fishing vessels, or by carrier, anything up to 3,000,000 cwt. per annum. With the end of the war in 1945, a move was made by Denmark, Sweden and Norway to reopen the landing of fish in British ports, and so far as landing facilities were available this was permitted, but to this policy the British fishing industry was not unnaturally much opposed. It had always been the claim of the British industry that so far as whitefish was concerned it could by its own efforts supply the home consumer with all the fish wanted, and it was hostile, even before the war, to any foreign imports of fresh fish, and wished to see them entirely eliminated. So long, however, as food was short, it was impossible to refuse this essential supply, and at the end of the war it was contemplated that many months would elapse before the British industry could achieve landings 100% of prewar years.

The following paragraphs show the landings of British demersal fish and the total supply of British and foreign demersal fish during the war years, as compared with similar landings in 1938.

In 1940 British vessels accounted for about 31% of prewar landings, but foreign landings brought the total up to 48%. Corresponding figures for 1941 were 24% British, 40% (with foreign); 1942, 30% British, 48% (with foreign); 1943, 30% British, 49% (with foreign); 1944, 31% British, 55% (with foreign); 1945, 48% British, 73% (with foreign).

In 1946, when requisitioned trawlers began to come back in large numbers reconditioned for fishing, catches rose rapidly, and the weekly landings up to the middle of the year frequently exceeded 100% of prewar, if foreign landings are included.

With the end of hostilities many problems faced the industry in the sphere of rehabilitation, and these problems were not peculiar to Great Britain. First and foremost was the urgent necessity of getting the many fishing vessels on naval service derequisitioned and then reconditioned for fishing, an operation which took several months. Then there was the pressing need for men to man the vessels as they came back; added to this was the need for more labour right down the line from the port where the fish was landed to the fishmonger's slab where it reached the consumer. Thirdly, the war had made such demands upon the railways that the provision of additional fish trains and trucks became a difficult matter; nevertheless, the provision of improved services was comparatively rapid. Shipbuilding facilities were extremely limited, but, even had this not been the case, there was an unwillingness on the part of the trawler owners to embark upon new building at a price more than double the prewar figure. Nevertheless, by the middle of 1946 some 25 or so trawlers were either building or completed.

One of the most serious problems that faced a large sec-

tion of the British trawling industry was the danger that as the result of the opening up of the fishing grounds closed during the war, e.g., the North sea, these would soon be fished to capacity, as they were after World War I, and with all the disastrous results that followed the overfishing which then took place.

As the result of the conclusions of a committee of scientist set up early in the war, the government convened an international conference on overfishing in London in April 1946, and its findings were fully recorded in a White Paper. The 14 countries represented agreed to a convention setting out the size of the mesh of nets, the use of which was permissible and the length below which certain fishes should not be permitted to be retained on board fishing vessels, landed or sold. This convention, which awaited ratification and was to come into operation two months after the last ratification was in, was an advance upon the agreement reached in London in 1937 which, however, never fully came into operation. It was clear that the representatives present were not prepared to adopt any other expedient to prevent overfishing, e.g., a reduction of aggregate tonnage, but in the final act of the conference the British government was asked to convene a standing advisory committee consisting of one delegate and one expert from each country to study the various expedients in detail and to report within a year from April 1946.

The problem of overfishing in the North sea and elsewhere was one of the greatest facing the many countries who depend so much upon their respective fishing industries. (See also FOOD SUPPLY AND WORLD WAR II; MARINI: BIOLOGY; VITAMINS.)

Flood Control

During the ten-year period 1937–46, the United States adopted a long-range program of flood control on a nation-wide, intrabasin basis.

The Flood Control act approved June 22, 1986, had established a definite policy for federal participation in the construction of flood-control projects throughout the nation in co-operation with the states, political subdivisions thereof or other responsible local agencies. About 270 flood-control projects, with a total estimated construction cost of \$310,000,000, and about 240 preliminary examinations and surveys for flood control were authorized. The initial funds for carrying out the provisions of the act were appropriated July 19, 1937, although money previously made available from the Emergency Relief Appropriation act approved June 22, 1936, permitted the war department to proceed with the preparation of detailed plans and definite project estimates. Within the limits of available funds from the Appropriation act approved July 19, 1937, actual construction was placed under way on many of the projects for which local interests had previously fulfilled the requirements of local co-operation established under the law. Additional funds under the Appropriation act approved June 11, 1938, provided means for continuing the projects and for the initiation of others.

The Flood Control act of 1936 was amended in 1937 to authorize construction of levees, flood walls, and drainage structures for the protection of cities and towns in the Ohio river basin, the projects to be selected by the chief of

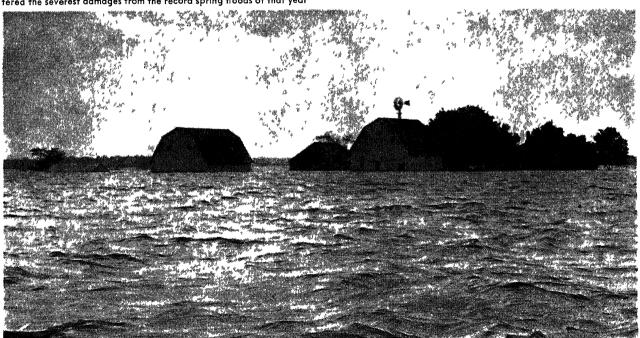

Flooded farmland on the Illinois side of the Wabash river west of Vincennes, Ind., in May 1943. Of the midwestern states, Illinois suffered the severest damages from the record spring floods of that year

engineers, U.S. army, with the approval of the secretary of war, at a construction cost not to exceed \$24,877,000. The need for these protection measures was forcefully demonstrated by the disastrous flood of Jan. 1937. This act also included authority for flood-protection work at Memphis, Tenn., at an estimated construction cost of \$9,000,000, and further directed that preliminary examinations and surveys of some 114 rivers and streams be made throughout the country for the purpose of determining the need, location and type of flood-protection work.

Under the same acts, congress reaffirmed that the federal government should participate in the improvement of navigable waters or their tributaries for flood-control purposes, if such projects were economically justified and if the lives and social security of people were otherwise adversely affected. These acts also specified the local co-operation required for the projects authorized therein.

These requirements of local co-operation, in brief, were as follows: (1) Dam and reservoir projects authorized in any flood-control act were to be constructed entirely at the expense of the United States and maintained and operated with the use of federal funds. No local co-operation was required for dam and reservoir projects unless specifically prescribed by special provisions of law. (2) For local floodprotection projects, except channel improvement or channel rectification projects authorized by the acts of 1936, 1937 and 1938, local interests must provide without cost to the United States all lands, easements, and rights-of-way necessary for the construction of the projects, hold and save the United States free from damages due to the construction works, and maintain and operate all the works after completion in accordance with regulations prescribed by the secretary of war. Channel improvement and channel rectification projects authorized by the acts of 1936, 1937 and 1938 were to be built entirely at federal expense, and no local co-operation was required. Exceptions to these general rules were provided by law in the case of certain specific projects.

A policy for the development of recreation facilities in connection with reservoirs under the control of the war de-

351

Sandbags being piled up along the levees at Cairo, III., against the destructive floodwaters of the Mississippi in 1937

partment was defined in the 1944 Flood Control act, which stated that the chief of engineers under the supervision of the secretary of war was authorized to construct, maintain and operate public park and recreational facilities in such reservoir areas, and to permit the construction, maintenance and operation of such facilities. The act further provided that the secretary of war was authorized to grant leases of land including structures or facilities thereon in reservoir areas for such periods and upon such terms as he might deem reasonable; that the water areas of all such reservoirs should be open to public use generally without charge for boating, swimming, bathing, fishing, and other recreational purposes, and ready access to and exit from such water areas along the shores of such reservoirs should be maintained for general public use when such use was determined by the secretary of war not to be contrary to the public interest. This act further provided that no use of any such area should be permitted which was inconsistent with the laws for the protection of fish and game of the state in which the area was situated.

The Flood Control act approved June 28, 1938, authorized additional flood-control improvements in 19 separate river basins or portions thereof, including an amendment to the project for floodways in the lower Mississippi river and the execution of examinations and surveys for flood control on 105 rivers and streams. The sum of \$375,000,000 was authorized for construction of the projects included in this act.

The policy for the development of reservoirs to provide for best possible utilization of the water resources of the nation was broadened by the 1944 Flood Control act. This act stated that whenever the secretary of war determined upon recommendations by the secretary of interior that any dam and reservoir project operated under the direction of the secretary of war might be utilized for irrigation

purposes, the secretary of the interior was authorized to construct, operate and maintain under the provisions of the federal reclamation laws such additional works in connection therewith as he might deem necessary for irrigation purposes. Such irrigation works might be undertaken only after a report and findings thereon had been made by the secretary of the interior as provided under the reclamation laws and after subsequent specific authorization of congress (by an authorization act).

The disposal of electric power and energy generated at reservoir projects under the control of the war department, and in the opinion of the secretary of war not required in the operation of such projects, was prescribed by congress in the Flood Control acts approved Dec. 22, 1944. In accordance with this legislation, such electric power and energy was to be delivered to the secretary of the interior, who was to transmit and dispose of this power and energy in such manner as to encourage the most widespread use thereof at the lowest possible rates to consumers consistent with sound business principles, the rate schedules to become effective upon confirmation and approval by the Federal Power commission. The legislation stated that preference in the sale of such power and energy should be given to public bodies and co-operatives.

The largest single unit and an outstanding example of the nation's intrariver basin development for flood control and allied benefits was the broad program authorized by congress in 1943 for control of floods and multiple-purpose utilization of the vast Missouri river system. Estimated to cost ultimately \$1,500,000,000, the combined plan provided for the building of 105 reservoirs on the main stream and its principal tributaries. The reservoirs were to have an aggregate capacity of about 100,000,000 acre-feet of water to serve the needs of the entire basin, comprising 530,000 sq.mi. During the period 1937–1946, floods in the basin cost 234 lives and a total of \$200,000,000.

Actual construction of the reservoirs was delayed by World War II, but work was begun on five of the projects in 1946. These were Garrison dam, approximately 75 miles upstream from Bismarck, N.D., Fort Randall dam, about 60 miles west of Yankton, S.D., Kanopolis dam on the Smoky Hill river in Kansas, the Harlan County dam on the Republican river in south central Nebraska, and the Cherry Creek dam near Denver, Colo. The key project in the system, Garrison dam was to impound the largest volume of water in the world behind an earth-fill dam. When completed, it was to have a crest length of more than two miles and a base width slightly exceeding one-half mile, exclusive of a 1,250-ft. impervious upstream blanket. It was to be 210 ft. high, and at normal pool elevation of 1,850 ft., to impound approximately 23,000,000 acre-feet, inundating 390,000 acres of land and creating a reservoir 200 miles long. By comparison, Fort Peck dam, placed in operation by the corps of engineers in 1938 in Montana, had a maximum reservoir capacity of 19,000,000 acre-feet, a 2-mile crest and inundated 245 acres.

At the end of June, 1946, 50 reservoirs and 135 local protection projects were in operation throughout the United States. In addition to previous authorizations, congress in the Flood Control act approved July 24, 1946, authorized expenditures by the war department amounting to \$772,-000,000 for approximately 123 additional flood control and multiple-purpose projects. With the passage of the 1946 Flood Control act, congress had approved authorizations totalling \$2,452,400,000 for the construction of about 770 reservoirs and local protection projects. In the period from 1937 through July 30, 1946, funds totalling \$835,421,900 were appropriated for flood control (general) purposes. Of the amount, \$769,472,000 was for the construction and detailed planning of projects. The remaining \$65,949,900 was for maintenance of completed projects, surveys and miscellaneous items.

The authorized projects collectively constituted a comprehensive co-ordinated plan for the development of the river basins of the U.S. to provide economical flood protection and allied benefits for centres of industry and population, millions of acres of rich, agricultural land and vital lines of communication. In addition to their use for flood control, many of the reservoirs provided favourable possibilities for the development of hydroelectric power, stream flow regulation, water conservation, recreation and other water uses.

A number of projects were completed during 1946, including the Indian Rock dam in Pennsylvania and local protection works at East Peoria, Ill., Sauvie Island, Ore. and in the Skamokawa Creek area, Washington.

After the close of hostilities in the Pacific, congress appropriated \$84,659,000 in the First Deficiency act for the fiscal year 1946, and \$138,901,000 in the war department Civil Appropriation act for the fiscal year 1947, for continuing work on flood-control projects deferred during the war emergency and for the initiation of new, urgently needed projects. During 1946, work which had been stopped during the war in order to conserve equipment, materials and manpower, was resumed on the flood protection projects in river basins throughout the U.S. These projects included the Lisle and Elmira, New York, local protection projects in the headwaters of the Susquehanna river; the Plymouth, Wilkes-Barre, Williamsport and York, Pennsylvania local protection works along the middle and lower Susquehanna river; the Wallace Lake dam and reservoir in the Red river basin, Louisiana; the John Martin dam and reservoir, Colorado; the Blue Mountain dam and reservoir, Arkansas; Canton dam and reservoir, Oklahoma,

in the Arkansas river basin; the Clearwater dam and reservoir, Missouri, in the White river basin; local protection at the Kansas City and the Kanopolis dam and reservoir on the Smoky Hill river in Kansas, in the Missouri river basin; local protection works at Cincinnati and Massillon, Ohio, the Cache river diversion unit at Mounds and Mounds City, Ill., and the Dale Hollow and Center Hill dam and reservoir projects on tributaries of the Cumberland river, all in the Ohio river basin; Los Angeles river channel improvement and the Santa Fe dam, both in the Los Angeles county drainage area, California.

Projects previously authorized, and for which plans and specifications were prepared during World War II, were initiated at the following localities: local protection at Nashua, N.H., in the Merrimack river basin, the Union village dam and reservoir on the Ompompanoosuc river in Vermont; local protection works at Whitney Point, N.Y., and the Almond 'dam and reservoir, both units of the project for southern New York and eastern Pennsylvania; Sunbury, Pa., in the Susquehanna river watershed; preliminary work on the Clark-Hill dam and reservoir project in the Savannah river basin, Georgia and the Allatoona dam and reservoir in the Coosa river basin, Georgia; preliminary work in connection with the Narrows dam and reservoir on the Little Missouri river, Arkansas; local protection for Shreveport, La., in the Red river basin; Hulah dam and reservoir in Oklahoma, Fort Gibson dam and reservoir, Oklahoma, Fall River dam and reservoir, Kansas, Wister dam and reservoir, Oklahoma, all in the Arkansas river basin; preliminary work at the Bull Shoals dam and reservoir, Arkansas, in the White river basin; Harlan county dam and reservoir on the Republican river, Nebraska, Cherry Creek dam and reservoir for the protection of Denver, Colo., local protection works at Kensler's Bend, Schuyler and Omaha, Neb., and Council Bluffs, Iowa, and preliminary work in connection with the construction of the main Missouri river dams at the Fort Randall and Garrison sites, all in the Missouri river basin; Delaware dam and reservoir, Ohio, Dewey dam and reservoir, Kentucky; and preliminary work in connection with the Conemaugh dam and reservoir project, Pennsylvania; local protection works at Newport, Ky., Punxsutawney, Pa., Parkersburg and Elkins, W.V., all in the Ohio river basin; preliminary work in connection with the Dorena dam and reservoir in the Willamette river basin, Oregon.

In addition to the general flood-control program, work on the projects authorized separately for the alluvial valley of the Mississippi river and for the Sacramento river, California, was continued to protect agricultural lands, communities and principal arteries of communication. Great Britain.—Provisions for flood control in Great Britain included river improvement works, the creation of

25/

reservoirs, and systematic gauging of rivers and their tributary streams. Protection by means of embankments was, in some cases, a measure of control, but usually one of local protection only. Eighty schemes approved by the minister of agriculture were in hand in 1937, covering works of land drainage, river improvement and river flow control. The total cost was estimated at about £7,000,000, state-aided by grants ranging from 15% to 75% of the cost.

No important work of flood control was carried out for the Thames during 1937–46, but the influence of works of river-channel improvement, completed in 1935, may have been considerable. They included: a new cut, or flood channel, across a long bend (the cut being 100 ft. in top width and 1,463 yd. long); the widening of the channel at a number of places; and the enlargement of Teddington weir. (See *Engineer*, London, June 28, 1935.)

There were two schemes for the creation of reservoirs on affluents of the Thames. A. B. Buckley's scheme would provide four reservoirs of aggregate capacity 6,378,000,000 cu.ft. to keep the discharge of Teddington weir down to a maximum of 4,500,000,000 gal. a day. Water would also be available for the augmentation of London's water supply, to a useful and, perhaps, fully adequate extent. G. Bransby Williams' scheme was for the ensuring of ample supplies to the reservoirs of the Metropolitan water board, sufficient capacity for flood control (10,700,000,000 cu.ft. in a total capacity of 16,500,000,000 cu.ft.) being made available. Bransby Williams also put forward proposals for similar provisions for the control of the flow of the Severn and utilization of water-electric power, by the creation of five reservoirs of aggregate capacity 47,000,000,000 cu.ft., of which 31,000,000,000 would be maintained for flow regulation. Systematic gaugings of the flows at different points on the river provided valuable information.

The catchment board completed in 1946 a comprehensive scheme of river improvement for the river Nene, then canalized as far as Northampton by 37 weirs with locks. The scheme included all necessary provisions at weirs, and installed nine river-gauging stations on the main stream and its tributaries, some of which were equipped with automatic discharge recorders. (For notable floods of the decade 1937–46, see DISASTERS.)

Florida

An extreme southeastern state of the United States, called the "Peninsula state" because of its peculiar outline, Florida has a coast line greater than that of any other state, extending 472 mi. along the Atlantic and 672 mi. along the Gulf of Mexico. Area, 58,560 sq.mi., of which 4,298 sq.mi. are water surface; population (1940) 1,897,414, of which 1,045,791 were urban and 851,623 were rural; 1,384,365 white and 513,049 Negroes. Only about 60,000 were foreign born. Capital, Tallahassee (16,240 in 1940). The larger cities are Jacksonville (173,065), Miami (172,172) and Tampa (108,391). On Nov. 1, 1943, the bureau of the cen-

Florida's first beach yachting regatta. Sand sailing became popular after World War II and was added to the sports open to vacationists in Florida

sus estimated the population of the state at 2,012,046.

The state elective administrative officers, in office in 1937, and whose terms expired in Jan. 1941, were Fred P. Cone, governor; R. A. Gray, secretary of state; Cary D. Landis, attorney general; J. M. Lee, comptroller; W. V. Knott, state treasurer; Colin English, superintendent of public instruction; and Nathan Mayo, commissioner of agriculture. George Couper Gibbs succeeded Cary D. Landis, who died in his term of office on May 10, 1938, as attorney general.

In the 1940 presidential election, Roosevelt received 360,407 votes; Willkie received 126,412. All five of the state's representatives in congress and Senators Charles O. Andrews and Claude Pepper were Democrats. Senator Andrews was re-elected in Nov. 1940. Pepper was elected in 1938.

Principal state officers in 1941, whose terms expired in Jan. 1945, were: Spessard L. Holland, governor; R. A. Gray, secretary of state; J. Thomas Watson, attorney general; J. M. Lee, comptroller; J. Edwin Larson, state treasurer; Colin English, superintendent of public instruction; and Nathan Mayo, commissioner of agriculture.

In the 1944 election the voters approved a constitutional amendment called the "right to work" amendment, despite the opposition of organized labour. There were 339,377 Democrat and 143,215 Republican votes cast in the 1944 presidential election.

The state elective administrative officers in 1945, whose terms were to expire in Jan. 1949, were as follows: Millard Caldwell, governor; R. A. Gray, secretary of state; J. Thomas Watson, attorney general; J. M. Lee, comptroller; J. Edwin Larson, state treasurer; Colin English, superintendent of public instruction; and Nathan Mayo, commissioner of agriculture.

State elective administrative officers in 1946, whose terms were due to expire in Jan. 1949, were as follows: Millard

Florida coast line lashed by the tropical hurricane of Sept. 1945. Travelling at a peak velocity of 143 m.p.h., it swept through southern Florida destroying crops, buildings and communications. Damage was estimated at \$50,000,000

Caldwell, governor; R. A. Gray, secretary of state; J. Thomas Watson, attorney-general; C. M. Gay, comptroller; J. Edwin Larson, state treasurer; Colin English, superintendent of public instruction; and Nathan Mayo, commissioner of agriculture.

Flour

While it was true that World War II exerted a powerful influence upon flour milling and the quality of flour throughout the world, it was significant that in English speaking countries an important trend toward improving the nutritive quality of flours had been under way for several years prior to the outbreak of hostilities. The movement to "enrich" flour dated from a meeting held March 12, 1936, when the Committee (Council) on Foods of the American Medical association discussed the fortification of foods and adopted the following policy:

If in exceptional cases a general need for vitamin (or inorganic salt) intake above that afforded by the usual mixed diet of common foods is indicated, the Council shall require (a) acceptable and convincing evidence that there is need for enhanced amounts of vitamins (or inorganic salts) in the general food supply, and (b) that the food vehicles proposed for the distribution of such vitamins (and/or inorganic salts) are suitable and appropriate.

Although no specific definition of fortified or vitamin enriched foods was attempted at that time, it was understood that "in general a fortified food was one in which the per-

centage of mineral elements or the unitage (concentration) of vitamins has been made significantly beyond that of the same food as it exists in nature. This enhancement of the vitamin (and/or the inorganic salt) content is brought about by the addition of a concentrate or rich source of the material salt or vitamins themselves."

The fortification, or "enrichment" movement continued to gain favour and impetus until in 1940 the reality of war on the European continent precipitated three major developments: (1) the decision of the British government in July of that year to fortify flour and bread with thiamin; (2) the decision of the Subcommittee on Medical Nutrition, appointed in the National Research council (N.R.C.) to recommend reinforcement (fortification) with thiamin of all white flour purchased for the army and navy of the U.S. and (3) a scheduling, for Sept. 1940 by the Food and Drug administration, of public hearings to consider a proposal for a standard for identity of flour.

Subsequent meetings and discussions produced substantial testimony indicating the need for vitamin B₂ (riboflavin), niacin (nicotinic acid) and iron, in addition to thiamin. In the U.S. the fortification of bread by means of added vitamins gained rapidly in popularity, and the term "enriched" was finally agreed upon as most acceptable to the Food and Drug administration; all parties subsequently agreed to it. By the close of 1942, support of the enrichment program had progressed until 75% to 80% of all family flour as well as baker's bread was receiving voluntary enrichment. A War Food administration order, enacted in Jan. 1943, required the enrichment of all baker's white bread and was later extended to include rolls.

That the enrichment of family flour and baker's white bread contributed significantly to the improvement of the North American diet was supported by the testimony of Dr. N. Jolliffe of the New York University College of Medicine. At a public hearing held Jan. 21, 1943, by the War Food administration Dr. Jolliffe testified as follows:

I attribute to bread enrichment a marked and unmistakable decrease in the incidence of florid beriberi and florid pellagra in my wards at Bellevue Hospital. In 1938–39 little bread was enriched; in 1942–43 seventy-five percent or more was enriched in New York City. This has been accompanied by a decrease of three-fourths (75%) in our cases of florid beriberi, and of two-thirds (66%) in florid pellagra.

The specifications relating to the enrichment of flour, dated July 1, 1943, to become effective Oct. 1, 1943, were as indicated in Table I.

Table I.—Nutrient Requirements for Enriched Flour

	Mınimum	Maximum
Thiamin	2.0	2.5 mg. per lb
Riboflavin	1.2	1.5 ,, ,, ,,
Niacin	16.0	20.0 ,, ,, ,,
Iron	13.0	16.5 ,, ,, ,,
Calcium, optional*	500	625 ,, ,, ,,
Vitamin D, optional*	250	1,000 U.S.P. units
*Required in self-rising flour	500	1,500 mg, per lb.

Effects of Enrichment.—Nutritional authorities agreed that "the merits of the program of bread and flour enrichment lie in the possible immediacy and universality of its effect" (National Research Council Bulletin). Russel M. Wilder and Robert R. Williams of the N.R.C. explained further as follows:

Bread and flour are so universally consumed in significant amounts—that the effect of improvement in their nutritional quality will be almost universally felt insofar as popular dietaries require this sort of improvement. On the average,—in the U.S.,—they are consumed daily to the extent of the equivalent of $6\frac{1}{2}$ ounces of flour, and furnish 25% of the caloric intake.

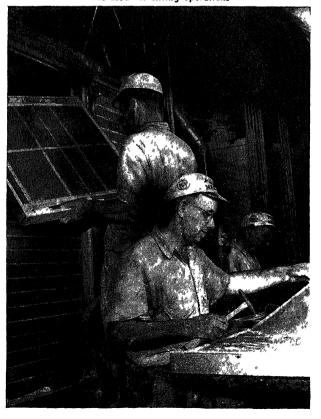

In addition to the extensive nutritional studies both indicating and confirming the necessity for supplementing the average diet with vitamins of the B complex (thiamin and riboflavin), a study by Ruth F. Harrell (1943) brought to light additional significant effects of providing adequate thiamin. It presented data to show that a supplementation of 2 mg. per person per day increased the learning ability of children (from 4 to 20 years of age), by 7% to 87% for a range of 18 activities selected for objectivity of scoring.

It was concluded that "the varying gains combined indicate that in general in this situation the group with the added thiamin improved more than the control group by about 27 percent" (Ruth F. Harrell, Effect of Added Thiamine on Learning, Columbia University Press, 1943).

Dark Flours and Long Extraction Flours.—The century-old controversy over "White versus Brown Flour" was well chronicled by Dr. F. L. Dunlap in a monograph (1945) based on a thorough survey of contemporary literature. While during the decade 1937–46, the relative merits of long versus short extraction flours were exhaustively argued, it was at last conclusively and fairly demonstrated that man, when making a free choice, had through the centuries turned to white flour in preference to dark flour for his nutriment. Over a period of about 20 years (in the U.S.) the sale of dark flours, i.e., greater than 85% extraction, had remained at a fairly constant level of 2 to 3% of the total flour output.

For many years there had been a popular misconception that the introduction of steel rolls, in replacement of the old-fashioned burrstones, was responsible for a general shift from dark to white flour. While it is true that the use of steel rolls helped make short extraction flours whiter, this was true only because the steel rolls were capable of

Millers restoring fine mesh silk to sifters after a critical white flour shortage in 1946. During the emergency period, coarser silk was used for sifting operations

fine adjustment, thereby giving the miller a better means of controlling the character of his grist. An incidental factor which aided this misconception was the advent of the middlings purifier during the so-called "milling revolution" of 1870–80, which together with the new "steel roller mill process" resulted in flour of finer quality without shortening the extraction. In fact, the innovation of these flour milling machinery refinements made possible the production of a very high quality flour while at the same time accomplishing a slightly longer extraction.

"Peeled Wheat" Flour.—An intensive effort to popularize dark bread throughout the U.S. during 1940–41 was based on a new milling process wherein substantially the entire wheat berry, except for the outer portion of the branny layer, was pulverized to a relatively fine-textured whole-wheat flour. The so-called "peeled wheat" process yielded a flour which when freshly milled could be baked into a rather appetizing bread called "staff bread." Although this item was cleverly advertised and skilfully merchandised, the project was abandoned after more than \$1,500,000 had been expended in development and promotional effort. There were still, however, many ardent advocates of whole-wheat flour (and bread), both in Great Britain and in the U.S.

Influences of the War.—Had it not been for governmental edict, it is doubtful that the U.S. milling industry would have found it necessary to alter its milling practices in support of the war effort. This was not the case in Great Britain, where, in order to extend the production of flour to the maximum of milling capacity, the National Wheatmeal program was decreed as a matter of military necessity. Beginning March 23, 1942, in compliance with a ruling of the ministry of food, the milling of flour of less than 85% extraction was terminated. Shortly thereafter Canadian millers agreed to furnish 85% extraction flour for export to Great Britain.

Governmental agencies issuing orders affecting the food supplies of the U.S., including flour, were (1) the Food Distribution administration, set up Dec. 5, 1942, which on April 19, 1943, was merged with (2) the War Food administration, and (3) the War Production board. The latter agency created a major change in milling practice by setting aside the time-honoured 196 lb. bbl. (net wt.) as the standard unit of flour weight. Likewise the ½ bbl. unit, the 98 lb. sack, was discarded in favour of the new 100 lb. unit quantity, effective May 1, 1943.

Another development in packaging, especially with reference to flour for export, was the subjection of flour at the packer to a compressive force of about 2,000 pounds per sq. in., thus substantially decreasing the bulk so that less shipping space would be required for a given weight of flour.

The consequences of war throughout the world had even greater influences on flour milling practices than during the period of actual hostilities. In an effort to avert severe famine conditions in those countries whose normal food supplies were most seriously disrupted, the principal flour producing nations,—Great Britain, Canada and the U.S.—in accord with the U.N.N.R.A. program, began in late 1945 to take steps to increase the world-wide production of flour. Since, during the war years, wheat reserves had been virtually exhausted everywhere, it was deemed necessary to extend the grain supply by every possible means. Longer extraction flours were ordered milled, and beginning with the winter wheat crop of 1945–46, all U.S. mills increased from the customary 72% to a minimum

80% extraction. British millers, already operating at the 85% "wheatmeal" level, were ordered to increase to 90% extraction. A further action of the Famine Emergency commission (U.S.) in co-operation with the U.N.N.R.A., was to place in effect an official order limiting millers to 87.5% (for 1946), of the 1945 production for domestic use.

Progress in Cereal Chemistry.—Cereal chemistry with respect to flour milling made greater progress during the decade 1937–46 than during any other comparable period. Cereal research in grain and flour composition—especially with respect to vitamin and mineral determination—laid the foundations for the program of flour enrichment.

While mill control problems continued to be the principal work of the cereal chemist, several new fields of cereal investigation were revealed in the realm of nutrition research. Co-operation between mill control chemists and cereal research chemists resulted in improved laboratory methods for control of flour quality. According to J. M. Doty, typical problems solved by cereal chemists included perfection of faster methods of vitamin assay, especially thiamin and riboflavin; enrichment (in addition to flours), of corn grits, farina, hominy and various cereal mixtures; vitamin fortification of mill feeds; baking losses of vitamins in bread; and, the effects of direct sunlight on vitamin concentrates.

Vitamins in Mill Products.—Determinations of the distribution (per cent concentration) of the several vitamins in the products of commercial milling, was an important contribution by biochemists to the knowledge of nutrition. The results of this work are consolidated in Table II.

Table II.—Vitamin Distribution in Products of Commercial Milling

	Mill Yield	Thiamin		Riboflavin		Niacin*		
Mill product	%	mg./lb.	% of wht.	mg./lb.	%	mg./lb.	%	
Patent flour	63.0	0.30	8.0	0.18	21.0	12	10.2

*Nicotinic acid (pellagra preventative).								

Statistical and General Data.—The 1937 U.S. Census of Manufacturers listed 2,143 establishments as primarily grain mills, classified as in the flour milling industry, and having an annual production of 5,000 bbl. or more. With an average employment aggregating 24,771 wage carners, these mills had an average employment of but 12 workers each. The importance of small units in this industry may be judged from the fact that more than 88% of all establishments employed fewer than 21 wage earners, and more than 25% of the workers in this industry were employed in such mills. About 44% of the wage earners were in mills employing between 21 and 100 workers, and 28% were in larger establishments.

During the decade, second place in U.S. milling centres passed from Minneapolis to Kansas City, Mo., the latter city having a daily flour capacity of 60,720 cwt., and Minneapolis 60,400 cwt. Buffalo, N.Y., retained leadership with a daily capacity of 100,200 cwt. in 1946. Other important U.S. milling centres: Toledo, Dallas-Fort Worth, Seattle-Tacoma, Chicago, St. Louis, Wichita, Salina, Hutchinson, Atchison, Omaha and Duluth-Superior.

Canadian milling centres rated in capacity as follows, (figures in bbl. per day); Port Colborne, Ont., 12,000; Keewatin, Ont., 10,000; Montreal, Que., 9,000; Winnipeg-St. Boniface, Man., 8,450; Saskatoon, Sask., 8,100; Medicine Hat, Alta., 5,600; Peterboro, Ont., 4,320; Moose Jaw, Sask., 4,100; and Toronto, Ont., 3,775.

Fluorspar

World production of fluorspar was greatly increased by the demands of World War II, mostly for the steel industry, but for others as well. Data are shown in Table I, so far as available.

Peak demand in the United States was reached in 1944, when shipments were 413,781 tons; imports 87,200 tons; consumption 410,170 tons. Activity declined in 1945, continuing into 1946, when shipments for the first 8 months were only 158,310 tons and consumption 185,105 tons; even so the operating rate was well above the prewar level. Imports declined more heavily than production, receipts from abroad totalling only 18,463 tons through Aug. 1946.

The over-all effects of war demand are shown most clearly in the consumption data in table II. On a tonnage

basis, the increase in consumption was about evenly divided between the iron and steel industry and the production of hydrofluoric acid, but on a relative basis the former increased only about two-thirds, while the latter increased five-fold. Contributing factors to this heavy expansion were the use of hydrofluoric acid in production of high octane aviation gasoline, insecticides (DDT), refrigerating liquid (freon) and artificial cryolite, used in the production of aluminum and magnesium.

In order to expand output to meet demand, extensive use was made of new methods of beneficiating the crude mine output, especially by flotation and heavy-media separation. (G. A. Ro.)

Flynn, Edward Joseph

Flynn (1892-), U.S. politician who directed the third-term campaign of Pres. Roosevelt in 1940, was born in the Bronx, New York city. He first made the acquaintance of Roosevelt while he was a member of the New York state assembly, to which he was elected in 1918 after graduating from the law school of Fordham university. When he was elected sheriff of Bronx county in 1921, he became political boss of the borough under the tutelage of Tammany Hall. Later he supported James J. Walker for mayor of New York city, and when the latter was elected Flynn was appointed city chamberlain as a reward for his political support. Roosevelt, upon becoming governor in 1929, selected Flynn as his secretary of state, an office he retained under Gov. Herbert H. Lehman. He was chairman of the Democratic National committee from Aug. 1940 to Jan. 1943, when he resigned to accept the nomination for the position of minister plenipotentiary to Australia. Following vigorous opposition from the senate, however, his nomination was withdrawn by Pres. Roose-

In 1945, he was sent by the president on a diplomatic mission first to Moscow and then to Rome, where he conferred with Pope Pius XII.

Folklore, American

The period 1937-46 was a decade of the common man, the Americana decade. The lingo, the attitudes, the yarns and the tunes of ordinary Americans were recognized as something important and valuable and were proudly accepted by the whole nation. American folklore, formerly the preoccupation of the specialist, became a familiar part of broad American cultural activities.

In 1937 Paul Bunyan was just another name: in 1946 most Americans had heard stories of the giant lumberjack and his blue ox that measured 40 axe-handles between the horns. In 1937 a professional ballad singer was a quaint hobo with a guitar: by 1946 this same ballad singer was likely to be in a Hollywood studio. This cultural movement was a culmination of more general trends: a breaking of U.S. cultural dependence on Europe, a heightened appreciation of American cultural heritage, and a deep need for art, literature and music that reflected U.S.

democratic and equalitarian political ideals.

There had been a century of preparation for this development, a period in which all sorts of artists, writers, scholars and educators had gone to the people for the strong and salty stuff of oral literature. The professional folklorists had examined the main streams of American folk culture—frontier balladry, Afro-American song, American heritages from the folklore of France, Spain and other countries. There was a stock of folklore in the 48 states to match that of any other country in the world, both in point of variety and volume. It took a world war and a world struggle against fascism to crystallize and quicken this interest into the broad cultural movement which came to affect the lives of all Americans.

Corralling Folklore.—In the United States the balladhunter, the tale-catcher, the folklorist, was mainly occupied with corralling his folklore. The hardest part of his job had always been to find good informants in the midst of a busy and rapidly changing world and to cajole these normally shy people into giving up their tales and songs and sayings.

Formerly folklorists, in order to take down the yarns and ditties in his notebook, had to insist upon many interruptions and much repetition on the part of the folk artist. Thus both the spontaneity and the total emotional impact of the performance were seriously curtailed. The best recorder available was a cylinder machine which produced a thin and noisy sound, unpleasant even for the collector. With the advent of the modern portable disc recorder, however, the folklorist could bring his folklore "back alive." For the first time, the folklorist's colleagues and audiences could share with him the exquisite pleasures of the oral arts, the oldest and most universal of all arts. The musicologist for the first time could study at his leisure the intricacies of a folk performance. The importance of musical style, voice placement, ornamentation, accompaniment and harmony now became evident and could be evaluated. A ballad was no longer four staves of melody plus a dozen stanzas in a book, but a living piece of art, more than likely a basic melodic theme woven into a number of variations. The folk tale collector now brought back incontrovertible data for the linguist, for the psychologist and for his own understanding of the importance of style in the oral narra-

The sound recording, however, made its most revolutionary impression at the artistic level with learned foundations, government administrators, academicians, creative workers, students and laymen. The voice of the common man, sounding from the loudspeaker, opened new horizons and established immediate bonds of feeling and interest. The folklorist set up his microphone and switched on his amplifier at lumber camps, at mountain square dances, on prison farms, in the quiet of Indian pueblos, at primitive ceremonies in Africa and the West Indies, in the small houses of the people everywhere. The recording needle cut its tireless and accurate spirals of fiddling, Vaudou drumming, passionate folk sermons, the plain and pure singing of the old ladies, the shouts of men at work and the spoken commentary of the folk artists. When played back, these records delighted the performers and stimulated them to recall yet more folklore. When the collector played them for his home audiences his work was regarded with new interest.

So there grew in the Library of Congress, in Columbia university and in other institutions, great libraries of re-

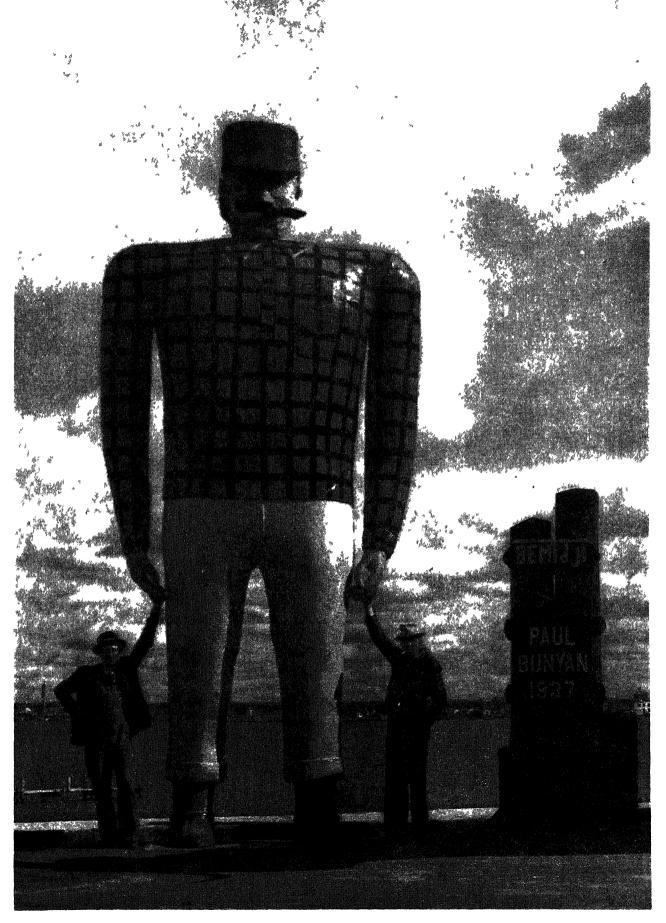

corded folklore still to be thoroughly studied and utilized. Gradually in the lay audience there emerged an appreciation of the real thing in folklore. In 1937, to cite one example, there were approximately 500 records in the Archive of American Folklore of the Library of Congress: in 1946 there were almost 8,000 records with speech and song from most of the regions of North and South America and the West Indies. When it was announced that certain of these records were available to the general public, more than 10,000 letters of inquiry were received within a month. Some understanding of the significance of folklore collecting became general in colleges, governmental institutions and even among music educators. Support for the folklorist, comparatively speaking, was everywhere at hand. Once the sound film came into play in field collecting, the folklorist would truly have his proper share of the world audience.

Meantime the folklorist, whether he used a notebook, a recording machine or a camera, was filling in the map of the folk culture of America.

Map of U.S. Folk Culture.—There are two fairly welldefined regions of Anglo-American folk song; the northern and the southern. The northern region includes the northeast, the middle Atlantic and the Great Lakes states as well as certain parts of the states to the west. The southern region includes the familiar southern states as well as the borderland territory lying along the Ohio river. The southern region, again, was deeply affected by, as it in turn deeply influenced, the Afro-American music that grew there. The great plains and the far west, an area of cowboy song and mining balladry, represented a fusion as well as a thinning out of both northern and southern traditions. From Canada down the Mississippi valley, and throughout the coastal area of Louisiana, there are traces of French folklore. The southwest is Spanish-American. Streaked and spotted across this broadly sketched map, folklorists someday would be able to outline the thousands of enclaves of non-English folklore.

Collections from all parts of the United States also demonstrated that the singing of so-called classical British ballads such as "Barbara Allen" and the "Two Sisters", once thought to be peculiar to the southern highlands, was formerly a pastime common to the frontier. It was indicated, too, that these mediaeval ballads had usually been connected by the folk with their own environment and experience and needs, rather than with some distant and romantic past; that they had been gradually displaced by journalistic and occupational ballads and both of these (in the southern region) by lyric songs.

By examining early American hymn books, George Pulen Jackson traced the relatively unknown white spirituals, from their roots in Europe, through the singing of masters of New England, through the great revival of the 1820s, and down to the 20th century. He showed how every revolution in the Protestant church had been accompanied by a flood of new hymns-religious texts, set to secular tunes. He pointed out that a part of the Negro spiritual tradition derived from Anglo-American folk song. On the other hand, comparative study by Melville J. Herskovits of recorded Negro folk song, as well as of social pattern in Negro communities throughout the new world, offered convincing evidence of a sturdy survival of Africanism in American Negro folk communities. One did not have to be a specialist to recall the many Negro folk songs and tales adopted by the whites. The pattern

of racial bias was inoperative in southern folklore. Negro and white folk artists, living and working side by side on the land, had always competed as performers and traded tales, songs and culture.

The power and the variety of Negro secular songs came to be recognized. The "sinful" singers, those wayward sheep who strayed away from the straight road of the spiritual which the Baptist and Methodist churches held to, had nevertheless created a whole world of song. The reels and buck-and-wing tunes of the Negro country fiddler and banjo-player had provided the impetus for the minstrel show music of the 19th century, as well as many new melodic and rhythmic patterns for all square dance musicians. Around the turn of the 20th century Negro folk musicians, basing their sombre melodies upon the worksong and the field "holler," developed a new dance music for piano and guitar. They called this style "the blues." "The blues" bid fair to become the national U.S. song form. This modern Negro folk music, encountering and fusing with the Creole Negro band music of New Orleans, also provided the spine for American jazz.

America came to know and value this world of Negro secular song, the terrifying rhythmic worksongs from the southern penitentiaries,

Captain called me, Called me a nappy-headed devil, That ain't my name, pardner, No, Lord, that ain't my name

the gay ragtime tunes of the country banjo and guitar player,

All I want in this creation Little bitty wife and a big plantation

the lonesome whoops and hollers of the field hand,

Go down ol' Hannah Don't you rise no more, If you rise in the mornin' Bring judgment on

the bitter, ironic and endless comment of the blues,

I'm goin' where the water tastes like sherry wine I'm goin' where the water tastes like sherry wine 'Cause this Arkansas water tastes like turpentine.

Although the folklorist had long since published many songs in his books and records, it was the awakening interest in hot jazz that turned the country's attention to them. Once music critics and record collectors examined the roots of the hot jazz that they "discovered," they were inevitably led to an appreciation of Negro secular and religious folk song. As tens of thousands of young Americans began to listen to these hot jazz critics and to share their enthusiasm for musicians like Louis Armstrong and Sidney Bechet, they too came to enjoy Negro folk music. The jitterbug decade led to a better understanding not only of Afro-American folksongs, but of the problems of the Negro people.

The American folklorist began to study the folklore of great cities. The WPA Writers' project in New York and Chicago turned up tales of demon brick-setters, superpowered beltline boys and garlands of pungent rhymes from the city playgrounds. It became apparent from studies in New York, Detroit, Chicago and San Francisco, that U.S. metropolises are patchworks of folklore in many languages. Just as in the backwoods, old ballads had been preserved which were no longer current in the parent countries. These old songs represented nostalgia for the homeland, in some sense. In many areas of foreign language culture, however (notably in the Spanish southwest and the Cajun country of Louisiana), there was a vigorous

creative process—recasting traditional lore in the American mould, developing indigenous forms, even spreading certain dances, songs and tales beyond the borders of the non-English-speaking groups. ("Beer Barrel Polka," "Allà en el Rancho Grande," the "Varsovienne," and "Bi Mir Bist Du Schoen" were examples of this trend.)

Finally, an extensive documentation of American folk tales and folk comment was begun. The popularization of the Paul Bunyan folk-literary legend led to the discovery of similar comic tall-tale heroes in many parts of the United States: John Darling in the northeast, Pecos Bill in the southwest, Febold Feboldson in the middlewest were merely a few of these. The American comic hero seemed made to match the size and savagery of the country. In the Smoky mountains Richard Chase unearthed a complete and full-bodied cycle of the delightful Jack Tales of the British Isles. These fairy tales or marchen had been endowed with southern backwoods colour and character.

The folklore section of the WPA Writers' project encouraged the collection of tales and folk commentary in all the states. In their files in the Library of Congress could be found the life stories of several thousand Negro ex-slaves alongside similar accounts from many unknown areas of American life. Volumes such as James R. Aswell's God Bless the Devil, B. A. Botkin's Lay My Burden Down and Stetson Kennedy's Palmetto Country, indicated the richness of this work and of the relatively unexplored field of oral narrative in the United States.

Folklore Gets Around.—A rough count indicated that approximately one-third of the important books in the field of American folklore were published in 1937–46. The yearly folklore bibliography for the hemisphere ran to 200 and more titles by 1946. Articles on folk singers, hot jazz and square dancing began to appear regularly in magazines of large circulation. In 1944 a folklore book—A Treasury of American Folklore, by B. A. Botkin—became a best seller, running into more than 500,000 copies.

The Folkways series, the River series, the Lake series, the Mountain series and the magnificent WPA State Guide-series all included a great quantity of local legends, tales, proverbs and superstitions, bringing this body of oral tradition to a wide reading public. Many books on hot jazz documented what was, in effect, a city folk music. Descriptions of "jam sessions" and autobiographies of the great improvisors of jazz acquainted America with the oral approach to music, that is, homemade music, played by ear and handed down by word of mouth. Meanwhile, through hundreds of pamphlets and folios, some distributed by large music publishers to music lovers and schools, others through hillbilly radio programs to lovers of old-time songs, cowboy songs, mountain carols, square dance ditties and ballads of every description reached a wider and wider reading public.

More important, however, in awakening a general interest in folk song than either the folklorists or their publications were the singers, the balladeers, who came wagging their banjoes and guitars to town. Their recordings, radio programs, concerts, motion picture appearances and their ever-growing circle of fans freshened the roots of oral tradition in every part of the country at the same time as they tended to obliterate local folklore developments and laid the basis for a national songbag, delivered in fairly well stabilized styles.

Around 1925 the commercial recording companies had begun to make their first experiments in recording rural music (Negro, southern white, Mexican and "Cajun"),

after they were persuaded that such records would sell in the home towns of the performers. They soon found, however, that these records had tremendous regional audiences. One of the earliest Negro blues recordings, for instance, sold 1,000,000 copies. The record companies rapidly added new departments to their catalogues. They sent scouts and portable equipment up and down the land, recording thousands of folk and semi-folk tunes from hundreds of oral artists.

At about the same time local radio stations began to permit a few local folk artists (country fiddlers, Negro quartets, ballad singers) to broadcast from their studios. They, too, discovered that a huge audience preferred old-time songs to any other type of music. It was out of these experiments that there developed programs like the "Grand Old Opry" and the "National Barn Dance." These (and numerous similar programs featuring ear musicians and a rural flavour) acquired great national audiences as well as commercial sponsorship, and assured the success of the large stations which initiated them.

Meanwhile the commercial folk artists who made the records and starred on the programs were creating a new kind of American music. Building on a repertory of traditional folk tunes and musical styles they rapidly added new instruments, new harmonic ideas and new "pop" song devices. Some of these singers became so popular that they were elected to political office. Jimmy Davis, the composer of "You Are My Sunshine" (a sentimental hill-billy song—probably better known than the national anthem), became governor of Louisiana. W. Lee O'Daniel ran for governor in Texas and was elected to the rhythm of a hillbilly band; he later was elected to the U.S. senate. Roy Acuff, star of "Grand Old Opry," turned down the governorship of Tennessee because the job didn't pay well enough.

Such musicians and their slicked-up country music were absorbed into the gigantic framework of the American music industry, and shared its boom during World War II. The spirituals, popular in all Negro churches, were largely composed and distributed by a group of accomplished folk artists turned commercial publishers in Chicago. Five thousand or more Negro quartets toured the American Negro world, singing their increasingly "hot" arrangements of the traditional spirituals to great audiences, both urban and rural. Gene Autry's singing westerns made him a national figure, a \$1,000,000 property in the amusement industry. The cowboy on the range was more likely to sing Autry's romantic ballads, composed in Hollywood and interspersed with an Americanized Swiss yodel, than the old cowboy ballads. Hillbilly, or cowboy, bands sprang up in almost every community in the United States, and few of the several hundred American radio stations failed to program some of their music; many carried little else on their schedules.

In this field of commercial folk song, one could find thousands of practising musicians performing pseudo-folk song for scores of lolk audiences: for the Irish of the northeast, the hillbillies everywhere, the Mexicans in the southwest, the "Cajuns" of southwestern Louisiana, the German and middle-European polka and schottische dancers of the midwest, the near-eastern groups of the big cities; in fact, for every cultural minority. This development offered employment and an avenue of self-expression to thousands of oral artists who might otherwise have gone unheard. These artists, under the harsh pressures of an urban world and a ruthless commercialism, wrought rapid and drastic changes in American folklore, cheapening it as well as vastly enriching it. Thus the people, as they

moved to town and as the city culture reached out to them, held to their own music, changing it somewhat to compete with music of the city, but retaining as much as possible of the favoured rural or regional flavour.

Authentic Folklore.—So much for the hillbilly singer and his like. We must now consider the interest of the amusement industry in real and authentic folklore, for it was treated in quite a different way from the commercial folk music. From record jockeys to long-haired concert masters, from small record companies to the moguls of Hollywood, there arose a serious concern about native American culture based on folk tradition. This concern began to mount sharply, and its consequences were legion.

In 1939 the Columbia Broadcasting system began its presentation of folklore and folk performers as such. It was in these programs that Burl Ives, Josh White, Peter Seeger, Earl Robinson, Lead Belly, Woody Guthrie, Aunt Molly Jackson and the Golden Gate Quartet were first given a serious and sympathetic presentation to a national audience. (The other networks also broadcast folk music in a variety of ways.) The subsequent careers of these singers led them into every part of the entertainment world.

Burl Ives grew up in a village in southern Illinois learning folk songs from his family and neighbours. He began to sing at country suppers, revivals and square dances; carried his banjo to college and played with a jazz orchestra. Later he took to the road with his guitar, hoboing through most of the 48 states, picking up songs, singing for his supper, and finally coming to rest in New York city, where he earned his board as a busboy at the International house. After appearances in two Broadway musicals he was put on the staff at Columbia Broadcasting system and began to build his great national following. There were stints in the folk music night clubs (the Vanguard, Cafe Society, the Blue Angel, etc.); albums for Columbia, Asch and Decca, a starring appearance in Elie Siegmeister's folk-musical "Sing Out Sweet Land." Burl's versions of songs like the "Foggy Dew," "The Blue-Tailed Fly," "Old Smoky" and others became nationally popular. Carl Sandburg called him the best American ballad singer. He soon went to Hollywood, but his enthusiasm for and his great understanding of the Anglo-American folk idiom remained unchanged. In Burl Ives, American folk song arrived in the entertainment world.

Josh White left his South Carolina home to lead blind Negro street musicians up and down the land. From his blind masters he learned a subtle and intricate folk guitar style. He added to his inherited repertory of blues and spirituals a great many fine songs from the Anglo-American tradition, as well as freedom songs and songs of protest Irom around the world. Wherever he sang—and he recorded for a number of companies, became a fixture at Cafe Society for a number of years, a favourite singer for the Roosevelts at the White House and a featured star in radio and on Broadway—Josh White linked the troubles of his own people to the world-wide struggle against prejudice.

Earl Robinson came from the state of Washington. His folksy ballads became the mainstay of the liberal and left wing movement. As he came to know the value of American folk songs, he used this material as the basis for large choral works, intoned, spoken and sung. His "Ballad for Americans" was accepted by all Americans of whatever shade of political opinion. His Lincoln cantata, "The Lonesome Train," woven out of folksay and

fiddling and Negro folk sermon, was an important American declaration during the early years of World War II.

John Jacob Niles had been collecting and arranging folk songs for many more years than the singers previously discussed. Although he was a folklorist of great taste and perhaps the most accomplished arranger in the field, his approach was essentially that of an "art" musician. His recordings, his pamphlets of ballads and carols, and his extensive concert tours served to convince many skeptics that U.S. native folk music was worthy of a place in the world of serious music. Because of his work, many beautiful songs, such as "Black Is the Color of My True Love's Hair," "I Wonder As I Wander," the "Cherry Tree Carol," were accepted as art songs in all musical circles.

Woody Guthrie, the dust bowl balladeer from Okema, Oklahoma, was of the breed of folk singer who composed such ballads as "Sam Bass," "Jesse James," and the "Jam on Geary's Rocks." Although Guthrie had some formal education, his inheritance of tolklore, his experiences as a wandering and homeless worker and his passionate concern about the common man dominated his many ballads. In the period of the dust storms he went west with the "Okies," composing a long series of ballads about what he saw and felt. His experiences in the Grand Coulee country in the northwest gave rise to another cycle of ballads about the Columbia river. In his work in the labour movement he created a series of powerful union songs in the lingo of the southwest. In the merchant marine, on the radio and on many recordings, in his hundreds of public appearances, Guthrie remained a sardonic and eloquent "Okie." A whole school of young ballad singers in the east emulated his fine and authentic style.

Peter Seeger, who might be called the king of the city billies, came from a distinguished and accomplished New York state family. He was educated at Harvard and learned from his musicologist father to appreciate world music. His interests developed around the five-string banjo, perhaps the only native North American folk instrument. The only way to study five-string banjo was to look up the folk artists who lived in the hills and hollows and backwoods. Seeger took to the backwoods, bringing back from his travels a fine and remarkable instrumental technique as well as a desire to use folk songs as a weapon for social progress. He organized People's Songs, a sort of national union of progressive ballad singers and composers, whose purpose was to comment on current topics, to satirize politicians, and fight racial prejudice, as well as to bring folk music to a widening audience. Its bulletin and its many crowded recitals brought folk songs and topical progressive ballads to an enthusiastic audience.

Broadway and Hollywood.—As in the other fields already discussed, there had been sporadic use of folk song both in the theatre and in motion pictures before 1937: in Green Pastures, Porgy and Bess and Green Grow the Lilacs, in the plays of Paul Green, Anne Caldwell and others; in Hallelujah, in The Covered Wagon and in the hundreds of westerns, to cite the most obvious examples. In the succeeding decade, however, because of the gathering prestige and popularity of native culture, producers began to take folklore quite seriously. In the Rodgers Hammerstein musicals (Oklahoma! and Carousel), in Bloomer Girl, in Dark of the Moon, in Sing Out Sweet Land, in St. Louis Woman, Call Me Mister, in Finian's Rainbow and Beggar's Holiday, folk ways, both linguistic and musical, contributed largely to the success of these hits. It was no longer a novelty to hear a folk song used as an opening,

as a part of the score, or as an integral part of a Hollywood film. In Burl Ives's *Smoky*, in Earl Robinson's *Callfornia*, in Elia Kazan's *A Tree Grows in Brooklyn*, folk song played an important role.

A folk song concert, whether in Town hall or in any other auditorium in the country, began to draw a large and respectful audience. Since the folklore wealth of the hemisphere corresponded quite well with the history and development of the new world, there was perhaps no limit to the ultimate value of folklore to all entertainment media.

"Serious" Music.-The so-called "serious" music audience not only accepted a number of "authentic" singers discussed above, but also applauded the efforts of a number of native composers who tried to quote folksong or adapt it for their work. Since the days of Anton Dvorak, the cry for American opera and American concert music had been persistent and somewhat annoying. A great number of the best U.S. composers had tried their pens on this seemingly difficult task. With a few exceptions, their output, while well-intentioned, did not have the validity, the originality or the strength of the "commercial" and Broadway music already described. Perhaps it was that too many of the serious composers were educated in Europe and so had lost some of their "feel" for America. A more likely supposition was that the life of a composer in U.S. society so isolated him from the life of the common man, so specialized his taste and his activity, that he could have little emotional understanding of the dynamics of the oral traditions.

This was not to say that interesting and exciting music had not resulted from this attempt of the written tradition to use the stuff of the oral. There was freshness and the substance of the American idiom in compositions such as Aaron Copeland's Billy the Kid and Salon Mexico, Roy Harris' Folk Song Symphony, Virgil Thomson's music for The Plow that Broke the Plans, Henry Cowell's American Suite, Bernard Herman's music for The Devil and Daniel Webster, as well as in many other scores. So far, however, nothing had appeared to match the efforts of Russian, Spanish, German and even Latin-American composers in salty, folk vitality.

A great many energetic figures in the educational world were making just such an attempt. Teachers, textbook writers and educational planners tried to orient more and more courses of study in terms of Americana, in terms of the materials close to the lives of their students. American folklore per se was now taught in many colleges, and there was scarcely an American boy or girl in the American public school system who failed to become acquainted with cowboy ballads, tall tales, legends, spirituals, mountain songs in a music course, in a social science course or in a course in American literature. This trend, which was stimulated by World War II, became much more marked in the postwar period. (A. Lx.)

Societies.—In Jan. 1945, 57 years after its founding, the American Folklore society was admitted by unanimous vote to constituency in the American Council of Learned Societies. On Aug. 22, 1946, the 100th anniversary of the coining of the word folklore by W. J. Thoms, a Folklore section was established in the Library of Congress. With these two steps folklore in the United States went a long way toward achieving the status of an independent discipline, firmly grounded in a synthesis of the humanities and the social sciences.

According to the librarian of congress, the new Folklore section was a recognition of the "importance of this subject to the full understanding of our own civilization as well as the civilizations of other countries," a recognition made necessary by the "development of folklore as a field of scholarly inquiry and the widespread interest in many aspects of the subject." This development owed much to the depression and to World War II, when the exploration and documentation of America were given new impetus and direction by the cultural program of the Work Projects administration and by wartime emphasis on American and inter-American studies.

As part of the revival of national unity and democratic culture, an increased awareness of the interdependence of disciplines helped to break down the separation resulting from the division of labour between ethnologists and folklorists proper, on the one hand, and between literary scholars and musicologists, on the other. In Dec. 1940 the American Folklore society inaugurated an active policy of integrating these studies. Thereafter, to give equal representation to anthropology and the humanities, the society chose its president in alternate years from these fields respectively and held its annual meetings alternately with the Modern Language Association of America and the American Anthropological association instead of regularly with the latter.

Literary folklorists and musicologists likewise sought to pool their resources and efforts. Especially influential in this respect were such organizations as the Committee on Musicology of the American Council of Learned Societies and the Folk Song committee of the Popular Literature section of the Modern Language Association of America. The survey made by George Herzog for the former (Research in Primitive and Folk Music in the United States, April 1936) and the report of the latter (June 1937) heralded a new era in folk song research. The end of the old era was marked by the passing-between 1937 and 1946 -of six folk song scholars: Phillips Barry (1880-1937), Frank C. Brown (1870-1943), John Harrington Cox (1863-1945), Mellinger E. Henry (1873-1946), George Lyman Kittredge (1860-1941) and Reed Smith (1881-1943). The earlier phase established first the study of ballad poetry and then the "rights of ballad music" and native American folk song of all types. In the later phase, a combination of many approaches-ethnological, sociological and psychological, as well as literary, linguistic and musicologicalresulted in more and better recording, transcription, classification, melodic indexing, checklists, comparative studies and life histories of tolk songs.

The integrating process in American folklore fostered and was in turn fostered by the growth of archives and societies. The increased availability of modern sound recording posed the problem of adequate preservation and accessibility of collections. At the same time the increased demand for source material from scholars, educators, broadcasters, composers, writers, etc., enforced the need of shortening the distance between collection and utilization.

Although the United States had no central depository and clearinghouse comparable to the great European archives, the nearest equivalent was the Library of Congress, containing the Archive of American Folk Song (1928, later incorporated in the new Folklore section), the Recording laboratory (1940) and the folklore collection of the Federal Writers' project (1941). Under the successive direction of Robert W. Gordon, John A. Lomax, Alan Lomax, B. A. Botkin and Duncan B. M. Emrich, and largely through the collecting activities of the Lomaxes, the archive acquired 8,500 instantaneous records (including duplicates of other collections), representing nearly all states and parts of Canada, the West Indies, Mexico and Central and South America. This collection was rivalled only by the

Archive of Primitive Music in the department of anthropology of Columbia university, under the direction of George Herzog, which in 1940 comprised about one-half of the total number of recordings of Indian music in the country, in addition to considerable folk music of foreign-language groups.

The increasing participation of the universities in folklore and folk song collection, study and publication indicated that the oral tradition had at last become respectable. Most institutions with considerable departments of anthropology or music or with active folklorists on the faculty possessed collections or were engaged in recording. Among the older collections were the Phillips Barry and Folk-Song Society of the Northeast collection at Harvard university; the collection of speech records at Columbia university; the Frank C. Brown collection at Duke university; the Archive of the Virginia Folklore Society, under Arthur Kyle Davis, Jr., at the University of Virginia; the Spanish-American collection of Arthur L. Campa at the University of New Mexico; and the Negro collections at Fisk and Northwestern universities. Later were the Archive of Vermont Folk Songs under Helen Hartness Flanders at Middlebury college, the Folklore Archives of the New York State Teachers college at Albany under Louis C. Jones and the Wayne University Folklore project under Thelma G.

The growth of folklore societies was also responsible for the increased number of collectors and collections. After 1888, when the American Folklore society was founded. some forty metropolitan, state and regional branches and societies in the United States had been established. Seven of these were organized during 1937-46: California (1941), Hoosier (1937), Michigan (1939), New Jersey (1945), New York (1944) South Carolina Negro Folklore guild (1944), and Wisconsin (1938); while an eighth, New Mexico, originally founded in 1931, was reorganized in 1945. Of the older societies the following were still active in 1946. French (1936), Kentucky (1912), North Carolina (1913), Pennsylvania (1927), Pennsylvania German (1935), Southeastern (1934), Tennessee (1934), Texas (1909), Virginia (1913). Five state societies-California, Hoosier, Michigan, New Mexico and North Carolina-became affiliated with the American Folklore society. In 1940 four state societies -California, Hoosier, Michigan and North Carolina-were affiliated with the American Folklore society. In order to effect closer co-operation with local groups, the society enlarged its council, obtaining better regional representation; appointed committees on research, utilization, and handbook; instituted a system of junior memberships for students and introduced, in the quarterly Journal of American Folklore, a regular department of folklore news and an annual section on work in progress.

These co-operative measures were directed partly toward amateur folklorists and were a tacit admission that the latter could no longer be ignored by professional folklorists any more than folklore could be ignored by scholars in other fields. With the growth of interest in local history and native culture, increasing numbers of persons were attracted to folklore as a leisure time activity or an allied field. They included laymen inspired by patriotic, antiquarian, or aesthetic motives and workers in education, recreation, social service and the arts. The problem of utilizing and guiding the uninitiated and volunteer worker as well as the co-worker from related fields was a problem in the conservation of human resources akin to that of conserving materials.

To meet the growing demand for instruction from both within and outside the folklore profession, an increasing number and variety of courses were introduced in the colleges and universities. According to a survey made in 1939 by Ralph S. Boggs and David P. Bennett, 60 courses were taught in 25 institutions, in departments of anthropology, English, German, romance languages, music and sociology. In spite of the growing popularity of courses in folklore and folk music appreciation, training courses and opportunities for specialization were limited by the scarcity of jobs for folklorists, which in turn reflected the low status of folklore teaching and the lack of systematic work. In 1939 Ralph S. Boggs succeeded in establishing at the University of North Carolina the first graduate curriculum in folklore in the country. At Indiana university, Stith Thompson organized the Summer Institute of Folklore (later the Folklore Institute of America), held in 1942 and 1946. Teachers and students, professionals and amateurs, were also brought together for discussion, consultation and study at conferences like the White Top (Virginia) Folk conference and the Western Folklore conference at Denver university (the latter held annually under the direction of Levette J. Davidson).

Festivals.—Folk, folklorists, and the growing folklore audience met at folk festivals. As a medium of diffusion, the festival helped to keep folk singing and dancing alive. As a form of utilization, it served the purposes of recreation, education, or entertainment. As a cultural expression, it enabled regional and ethnic groups to preserve their own identity and to understand one another better. Yet, because of the dangers of antiquarianism and exploitation, the festival, like the amateur collector, required proper guidance and control.

In the hands of different groups, with divergent points of view, the folk festival served a variety of purposes, with varying degrees of authenticity and responsiveness to changing conditions. At the old fiddlers' contest at Galax, Va., and the Asheville (N.C.) Mountain Dance and Folk festival (directed by Bascom Lamar Lunsford) the emphasis was placed on competitive and entertainment features. At the American Folk Song festival of the American Folk Song society at Ashland, Ky. (founded by Jean Thomas in 1931) and the White Top Folk festival (directed by John Powell and Annabel Morris Buchanan), the traditional forms of the English ballad, folk dance and singing game were preserved. At the Mountain Folk festival at Berea college, Ky., the Highlander Folk School festivals at Monteagle, Tenn., and the Annual Negro Folk festival at Fort Valley State Teachers college, Ga., old and new forms were integrated with a program of rural and social education, recreation and people's culture. The Folk Festival council in New York city (1931) and the Festival of Nations in St. Paul (held under the direction of Alice L. Sickels from 1932 to 1942) utilized the folk festival in intercultural education, as a common ground of cultural diversity. At Camp Woodland, Phoenicia, N.Y., the Folk Festival of the Catskills (founded by Norman Studer in 1940) was adapted to the uses of progressive education, stressing the place of folklore in a democracy and in rural urban exchange. In conjunction with the Pennsylvania Folk festival at Bucknell university, Lewisburg, Penn. (directed by George Korson from 1936 to 1938) and the National Folk festival (founded in 1933 by Sarah Gertrude Knott), local festivals were organized on a state-wide and nation-wide basis.

In New Mexico alone, according to Miss Knott, in con-

nection with the Coronado Cuarto centennial in 1940, 200 folk festivals were held in Spanish-American and Anglo-American communities and schools.

Hand in hand with the spread of festivals went the revival of folk dance, folk song and the folk arts on both a leisure-time and a vocational basis. With the setting up of the relief agencies, large-scale research and operating programs supplemented the work of public and private social agencies in adapting folk culture to community needs and resources and the skills of the unemployed. From 1935 to 1939 the Folklore Studies of the Federal Writers' project, under the successive direction of John A. Lomax and B. A. Botkin, employed untrained and semitrained personnel in gathering folklore on a national scale for use in the state guidebooks and special folklore books and pamphlets. In addition to actual publication, this program developed a nation-wide folklore intelligence service for locating informants and sources, produced thousands of pages of unpublished material later filed in the Library of Congress and specially designed state depositories, and had a general quickening and humanizing effect on the literature of folklore.

In Dec. 1938, co-operative folklore research, along interdepartmental, interdisciplinary and intercultural lines, was stimulated by the formation of the Joint Committee on Folk Arts, of the Work Projects administration, consisting of specialists from the Federal Writers', Music and Theatre projects, the Historical Records survey, the Index of American Design, the Recreation and Education divisions and the Technical Services laboratory. In consultation and cooperation with old-line federal agencies (such as the Library of Congress, the department of the interior and the department of agriculture) and non-federal agencies (such as the American Council of Learned Societies, the American Folklore society and various universities and committees), the Joint committee attempted to co-ordinate and implement the folklore program of the Work Projects administration.

Conferences and Publication.-Beginning in 1939 Washington folklorists held a number of planning and development conferences which influenced the course of tolklore organization and research for some time to come. In Oct. 1939 the state department Conference on Inter-American Relations in the Field of Music laid the foundation for a number of Inter-American projects, including the Inter-American Music Center in the Pan American union (under the direction of Charles Seeger) and the Library of Congress albums of Folk Music of the United States. In Dec. 1940 at the 54th annual meeting of the American Historical association in Washington, D.C., a discussion session was built around the use of folklore (Federal Writers' project), folk music (Federal Music project), dialect (Linguistic Atlas of the United States and Canada) and documentary photographs (Farm Security administration) as sources of cultural history. In April 1942 the American Council of Learned Societies sponsored a Washington Conference on the Character and State of Studies in Folklore to consider the various approaches (comparative, ethnological, functional and creative) and technical problems (field and laboratory techniques, archives and classification, bibliography, publication and progress and directions in teaching, study and utilization).

Similar conferences were held in other parts of the country. From 1942 to 1944, the Rockefeller foundation sponsored a series of conferences on the life and culture of the various regions, which resulted in several folklore projects, such as the Utah Humanities Research foundation under Hector Lee. In July 1944 the Kansas State Teachers col-

lege at Emporia sponsored the first of a series of annual folklore conferences. In Sept. 1944 the Folk Arts conference at the University of Minnesota brought together a group of inter-cultural leaders and folklore authorities to organize the Folk Arts Foundation of America and plan a postwar project for a Minnesota folk arts centre, museum and international park.

The attendant increase in the volume of folklore publication was indicated by the steady growth of the annual bibliography compiled by Ralph S. Boggs in the Southern Folklore Quarterly in 1938 and thereafter. From the range of subject headings and titles it was evident that folklore in America had enlarged its scope to include the study of the folk as well as the lore, handskills as well as mindskills and folklore in the making as well as survivals, in written as well as unwritten tradition. With the lessening of the distance between the various disciplines concerned with its study, larger and larger areas of culture and history were brought within the boundaries of folklore. Keeping pace with the growth of comparative and acculturation studies, increasing attention was paid to the influence of print on folk song and folk tale, to the aesthetic aspects of mythology and to folk history. At the same time folklore exerted a leavening influence on literature, as witnessed by the increasing use of folklore in novels, plays, poems, reportage and documentary writing.

As the rediscovery of folklore went hand in hand with the rediscovery of America, folklore emerged as an art and a science that gave promise of bridging the gap not only between the humanities and the social sciences but also between one cultural group or level and another. Food Supply and World War II

World War II and its aftermath created a degree of food-consciousness never before attained in the history of

modern civilization. Next to military affairs, the universal concern over food furnished the main topic of conversation, the main problems for legislators and public officials and the main basis for international collaboration.¹

Most governments were genuinely concerned over the measures that had to be taken to meet growing demands. This was reflected in the seriousness with which most governments participated in international deliberations on food and agricultural policy, and led to the opinion that one of the most significant developments of World War II was the greater realization of the essential function that food must play in society and of the relation of adequate diets to healthful living, greater vigour and emotional stability.

Axis War Preparations.—The extent to which the war preparations of the axis powers included food supply was noteworthy. Germany and, to a lesser degree, Japan and Italy, were highly successful in drawing the adjoining producing areas into the orbit of their economic influence and in utilizing the productive capacity of whole regions in accordance with their war aims.

Germany.—By following a deliberate policy of stimulating domestic agricultural production and discouraging consumption of high-grade foods, Germany succeeded in reducing considerably its imports of food and feed and in raising its level of agricultural self-sufficiency from 73% in 1929 to 83% by 1937. It reached an especially high selfsufficiency in feed. Net imports of starchy feedstuffs were reduced from 1,200,000 tons in 1932 to less than 200,000 tons in 1937. Imports of oilcake decreased from 2,300,000 to 1,200,000 tons, and oilseeds decreased from 2,400,000 to 1,800,000 tons during this period. Yet Germany's fat supply remained largely dependent upon imports. Imports of animal fats, plus production from imported feedstuffs, represented 55% of its fat consumption and thus became the main concern of Germany's food supply policy in the period of immediate preparation for World War II. Large quantities of grains, fats and feedstuffs for reserve purposes were purchased abroad, and a variety of measures designed to build up southeastern Europe as a source of steady supply were applied.

The goal of German trade policy, under the so-called "Schacht plan," was to integrate the economy of eastern and southeastern Europe into the German "system" with these countries replacing Germany's overseas sources as suppliers of raw materials and foodstuffs. The plan succeeded in tying these countries to the German economy, partly through exchange and clearing arrangements, partly by furnishing a guaranteed market for the agricultural products and industrial raw materials of the southeast, partly by paying high prices for these products and partly by forcing these countries to rely more and more upon Germany for their industrial imports. This development was illustrated by the fact that Germany's share in the trade of this area rose from one-sixth in the 1920s to about one-third in the latter 1930s.

Germany was the only European country which, during the prewar years, tried to achieve significant changes in its pattern of food consumption. The nazi regime proclaiming the *leitmotiv* of guns instead of butter, tried to divert consumption away from foods in which the degree of self-sufficiency was particularly low. This was especially true for fats, eggs and cheese. Consumption of fish and sugar was increased with the help of subsidies, regulated prices and rationing.

¹The authors acknowledge the valuable assistance received from the economics and statistics staff of the United Nations Food and Agriculture organization in analyzing the food position of various regions of the world.

Governmental regimentation of domestic agriculture was highly organized. Among the first measures adopted by the National Socialist dictatorship was a sharp reduction in payments for imports and corresponding financial aids to domestic production. Efforts to stimulate production were facilitated because full employment, as a consequence of the armament program, created a large demand for foodstuffs and rendered price increases possible. The index of prices of agricultural products was 23% higher in 1937 than in 1932.

To offset the decline in farm labour, improvements were made in farm equipment, and expenditures for machinery were increased between 1932 and 1938 by more than 160%. Various measures were devised to increase self-sufficiency in feedstuffs. Butter prices were fixed at a high level but so were prices of imported concentrates; thus, farmers producing their own feed had an advantage. Increases in crop yields were attained by applying much more fertilizer and by improved agricultural techniques. Because of the great value of the potato as an animal feed, its production was improved with the help of labour-saving machinery and fertilizer. The area under sugar beets was extended 50% and large quantities of beets were fed to livestock. Production of green feed crops was increased, and the silo capacity was extended from 650,000 to 7,400,-000 cu.m. As a result of these measures, the total production was expanded by more than 17% in 10 years without increasing the agricultural area and in face of a marked decline in feed imports.

Control of marketing and production had been achieved by setting up a special organization called Reich Food estate (Reichsnaehrstand). National and regional production goals were set up by this organization and, although individual farmers had a considerable leeway in their production program, the establishment of detailed farm records gave the regional representative of the Reich Food estate the opportunity to control and supervise each farm.

Price manipulation was, however, the most important device for the direction of agricultural production. The Reich Food estate could regulate the market and its prices by working through market associations, which were compulsory cartels set up for one or several specific commodities, and included producers, traders and processors. Prices and dealers' margins were fixed for all stages of the trade from the farm to the retailer. Setting higher or lower prices made it possible to increase production or marketing of certain products at the expense of others. The marketing associations could fulfil their functions because special national offices (Reichstellen) controlled all foreign trade and fixed import and export prices.

Italy.—The fascist government in Italy was interested in having as much food as possible domestically produced for financial as well as for political reasons. It was successful in raising prewar self-sufficiency to about 93%. State intervention included tariffs, licences, subsidies of staple food production, marketing control, price fixing and compulsory pools. Yet the degree of over-all control achieved was far short of that attained in Germany.

Land reclamation and improvement programs carried out by quasi-public agencies played an important role in Italy's agricultural policy. Production was aimed mainly toward an increased volume of wheat. High yields were awarded premiums while tariffs and guaranteed prices encouraged better farming practices. Special regulations provided for crop rotations and varieties suited to environmental conditions. In 1936 the compulsory consignment of

all wheat to collective pools (ammassi) had been imposed, and after 1939 the production of only one type of wheat flour was permitted. Agreements between producers and processors made possible the control of sugar beets, flax and hemp without establishing a special government agency. However, a special rice office was established which sold rice seed to farmers and bought the entire crop. In 1938 provincial corporations composed of all landowners and tenants were set up in order to control and develop the work of the farmers in accordance with the instructions of the ministry of agriculture.

Japan.—Like Germany, Japan took measures to assure adequate food supplies for World War II. While its schemes were less ambitious and less ably administered, Japan did manage to develop a high measure of economic control over neighbouring areas and thereby was able to attain a high degree of regional self-sufficiency. This scheme, known as "Co-Prosperity sphere," linked Japanese industry with Chinese, Manchurian and Indo-Chinese food and raw materials. Under this plan Japan depended on imports from adjacent areas for 15% to 20% of its food. One-sixth of its rice, the main food, came mostly from Korea and Formosa. About 70% of its soybean requirements were imported from Manchuria, more than three-fourths of the sugar consumed was supplied by Formosa, and the mandated territories in the Pacific provided the bulk of the copra and coconuts.

The arable lands in Japan proper were intensively cultivated, and marketing of agricultural products was efficiently organized. Domestic production and imports of food grains were supplemented by a huge fish catch which supplied the average Japanese with 95 lb. of fish per year. Food of vegetable origin, rather than animal, predominated in the diet.

A substantial reserve of rice was accumulated, partly as an insurance against crop failures, partly as a war reserve and partly in support of the price structure. In 1939 a rice distribution control law was passed which established a semi-official body called the Japan Rice Co., Ltd., for the purpose of monopolizing the rice markets for Japan.

Wartime Developments

During the period of axis domination, the food supplies of continental Europe showed a steady downward trend. Individual countries, however, were affected to varying degrees at different times. The quality of the diet deteriorated much faster and to a greater degree than the quantities of food consumed. The conquered areas frequently suffered severely while food supplies were requisitioned for German and Italian civilian and military purposes.

"Fat Gap."—In spite of its concerted efforts, Germany was unable to close the so-called "fat gap." This became the main problem of its wartime food production policy. Although it had extended the area under rapeseed from 6,000 ha. (14,820 ac.) in 1932 to 60,000 ha. (14,8200 ac.) in 1938, its total production of about 40,000 tons of oil covered less than 3% of its fat consumption, not including oils for industrial purposes. During World War II the acreage devoted to oil-producing plants was extended fivefold over 1938. The German climate, however, is not well suited for oilseed production.

Hunger and insecurity were familiar to millions of Chinese during World War II; cities were rapidly reduced to famine areas whenever marginal food supplies were cut off or destroyed by drought, hostilities or military requisitioning. Homeless civilians shown in the picture were living from hand to mouth after being bombed out of their homes in Changteh

Oil-producing crops were expanded elsewhere under German control. In German-occupied Belgium, for instance, farmers with more than 5 ha. (12 ac.) of land in 1943 were required to plant at least 6% of the cultivated area with oilseeds. In France the area devoted to oilseeds increased from a prewar average of 13,000 ha. (32,110 ac.) to 284,000 ha. (701,480 ac.) in 1944. Still more important was the expansion of oilseed production in southeastern Europe.

Production Changes.—Total agricultural production declined under the impact of World War II. Although some grassland, especially in Norway and the Netherlands, was ploughed up, total arable acreage was reduced. In France the seeded area was reduced considerably during the first year of World War II, and in other regions labour shortages and military operations had the same effect. The decreasing supply of fertilizers, insecticides, labour and equipment was felt more and more as the war progressed. Moreover, weather conditions were unfavourable during three successive winters, 1939–42. Under these conditions the prevalent policy was to shift further toward production for direct human consumption in order to save the large amount of food energy lost in animal feeding.

Production of potatoes and sugar beets producing the highest caloric value per hectare was extended. Sugar beet acreage of continental Europe in 1943 was more than 10% above prewar levels. Hungary, Switzerland, Turkey and Rumania cultivated from 30% to 40% more acres than in 1937-41. However, in the latter stages of World War II, farmers used more sugar beets for feed, thereby reducing the production of refined sugar.

Drastic measures were taken to reduce numbers of hogs and poultry so that the largest possible amount of grain and potatoes could be used directly as food. At the end of the war, hog numbers in Europe had decreased 40–50%. However, efforts were made to conserve milk cows, and by 1944 total cattle herds had decreased less than 10%, but the lack of concentrates affected the milk yield and the output of milk and milk products decreased by about 30%.

The utilization of the greater part of the crops for direct human consumption and the absence of all overseas feed imports resulted in a marked decline in meat, lard and eggs. Measured in calories, the meat and slaughter fat output decreased by 30% and the output of eggs by more than 50%. But while there was a marked decline in the volume of foods produced, the caloric value of the food supply consumed directly fell but little in some of the western European countries.

Trade and Requisitioning.—During the early years of World War II, Germany imported grain from Russia and oils from the far east across the Trans-Siberian railway. France received food and phosphate rock fertilizers from North Africa. The entry of soviet Russia into the war and the occupation of North Africa by the Allies in Nov. 1942 stopped these shipments. Although only a small percentage of Europe's caloric intake came from overseas, it meant an important reduction in Europe's fat and feedstuff supply.

Trade within Europe was almost entirely directed by the axis powers in the interest of their war strategy. Exports from various countries to Germany and Italy were either enforced by political or military pressure or were directly requisitioned by the occupying armies. Bread grain was shipped to Germany and Italy from occupied U.S.S.R., Poland and France; livestock products from Denmark, Poland and France; vegetables from the Netherlands; and oilseeds, cereals and other foodstuffs from Rumania, Hungary, Bul-

garia and the Danube plain of Yugoslavia. In a commodity exchange between Germany and Italy fruits went to Germany.

At the same time, some of the satellite or occupied countries had to be provided with foodstuffs they were lacking. Finland, for example, received bread grain, sugar and fat; Belgium received bread grain and Norway required sugar and wheat. Austria and the Sudetenland likewise were deficit areas, and France received small quantities of seed potatoes and sugar.

Administrative Measures.—Wartime food control had to deal with more complicated and much more vital problems than any prewar control. Many new devices were found. Still, direct control of the production pattern of the individual farms was practised to only a limited extent outside of Germany. Even there, where regional and local plantings were directed by the government, the farmer was left a certain leeway. In some countries the area for some special crops was fixed either as a percentage of a certain base period or as a percentage of the total crop land. Maximum figures for livestock were usually fixed in relation to a reference period.

In the main there were three devices used for assuring the production and delivery of agricultural products: (1) price policy and monetary premiums, (2) direct enforcement of production and delivery quotas and (3) economic incentives in kind. Nearly everywhere prices for vegetable products were fixed relatively higher than were prices for livestock products, as an inducement to sell crops for direct human consumption; premiums were paid if delivery quotas were exceeded. These monetary inducements became less effective as confidence in the currency declined. This caused the control authorities to use consumers goods as incentive payments for greater production efforts. Particularly, foods processed from agricultural products, as, for instance, oil and sugar, were given in return for certain quantities of oilseed and sugar beets delivered. Frequently various other kinds of consumption goods were given as awards or in exchange for agricultural products, in some cases approaching barter trade.

The direct imposition of production and delivery quotas, varying in scope and method of assessment according to the specific supply situation, was widely used. National, regional and local agencies were formed to enforce them. They worked well in Germany in co-operation with the terror apparatus of the nazi party but were much less successful in countries occupied by or allied with Germany. Flourishing black markets provided strong incentives for violation of governmental regulations.

Trade also was controlled everywhere by special agencies set up for this purpose. Laws prohibiting all sales except to licensed dealers or agencies were promulgated in most European countries but lost much of their meaning where control measures were not very effective.

Beside the control of production, collection and distribution of food, a number of other devices became necessary to assure a minimum food supply. To reduce the claim of food distribution on transport facilities, special regulations were tried in Germany to eliminate the overlapping of transport. The so-called millers' plan, for example, bound certain grain producers and millers together and reduced the volume of grain products transported beyond 15 mi. The brewing industry was likewise forced to exchange customers and was not permitted to deliver beyond a certain distance. Food deficiencies of some districts resulting from this scheme were corrected through special orders for extending production of these products in the particular area.

Consumption.—The quality of the diet in continental Europe deteriorated rapidly as World War II progressed. In western and central Europe, potato consumption increased because of the reduction in hog numbers and the increased quantity of potatoes available for human consumption. Bread consumption fell far less than grain production, since feeding of bread grain was forbidden in many countries, and coarse grains and potatoes were added to the bread. The extraction rate of flour was increased to 95% in many countries. While carbohydrate foods became more important in the diet, consumption of fats and animal proteins declined everywhere. This decline was especially marked in Norway, the Netherlands, Belgium and France.

By 1943 the average caloric intake in Germany, Austria and Italy had decreased only 5% or 6% since ample supplies from other European countries were requisitioned. In the agricultural surplus countries, including Denmark, the average caloric intake had been reduced by 10%, while in countries like France, Norway, Finland and the Netherlands, the reduction amounted to 20% or 30% and in Belgium and Greece to 35% or 40%.

These reductions in food supplies affected various groups of people differently. The axis armies had first priority. The farm population, having direct access to the food, ate what they needed before they delivered their products to the cities. As manufactured goods became scarcer, farmers became more reluctant to surrender their products. The urban population, however, with the exception of the very rich, had to live on a rapidly deteriorating diet.

In 1943-44 the food supply of the city population became more critical. Domestic output was falling, peasants were unwilling to sell through official channels, transportation difficulties were aggravated by bombings and the regional authorities resisted orders to share their food supplies with deficit areas. In many places the city population had to live on a starvation level; in some regions, especially where war and internal strife had disrupted production, peasants fared no better. The normal food deficit regions of Dalmatia, Lika, Montenegro and some

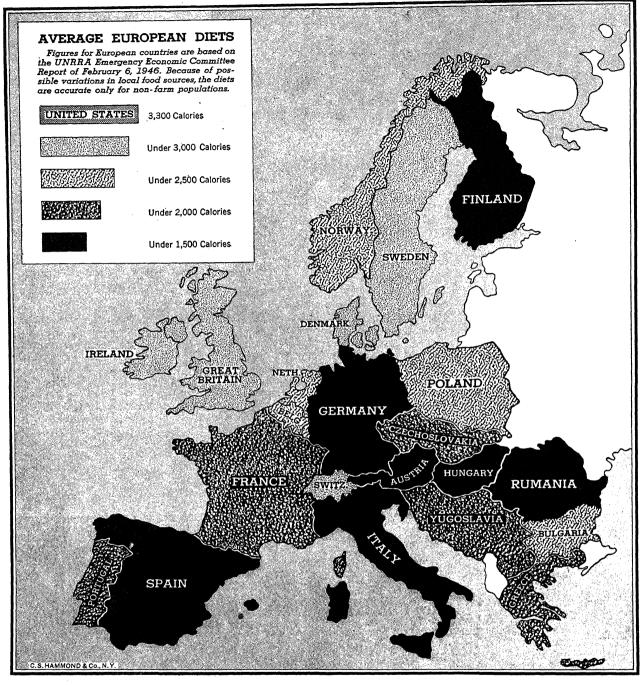

other areas of Yugoslavia, being cut off from the rest of the country by partition and by guerilla activity, were subject to starvation. As a matter of fact the farm population there was worse off than the city population since it was never self-sufficient, and any food imports coming into the region were distributed only in the towns.

Food rationing was introduced everywhere in Europe, at least for the city population, as a means of assuring a more even distribution. In most countries the population was divided into several consumer groups as heavy workers, workers, children of various age groups and so-called normal consumers. As cuts in the rations occurred, the normal consumer category was made to bear the brunt of the burden. In countries like Poland, where German occupation authorities were merely interested in the exploitation of manpower, normal consumer rations went down to 1,100 calories. Greece, which had few resources that could be exploited, was subjected to starvation. There the shortage of man and draft power combined with a severe drought in 1941, lack of seed and other factors had greatly reduced already meagre domestic production. The annexation by Bulgaria of some of Greece's best agricultural land added to the disruption of the food supply. As early as 1942 real famine conditions prevailed in Athens, Piraeus and the Aegean Islands. Hundreds died of starvation every week. Eventually, the belligerents agreed on a scheme which permitted sufficient relief shipments to enter Greece to relieve the catastrophic situation.

As food became scarcer, more people attempted to supplement their rations, causing prices for those extra supplies to climb higher. Everywhere an illegal trade developed. The effectiveness of the rationing system on the one hand and the extension of the black market on the other hand varied from country to country. The allembracing control system of production and distribution

U.S. Secretary of Agriculture Clinton P. Anderson (left), Sir John Boyd Orr, director of the United Nations Food and Agriculture organization and U.N.R.R.A. Director F. H. La Guardia, during 1946 sessions of the F.A.O. at Washington, D.C.

in Germany facilitated the working of the rationing scheme. The severity of the penalties helped also to keep black market offenses down, although they did not prevent them. In France the black market played a much larger role. The attractiveness of high prices and the desire to keep supplies out of German hands worked together to keep rations adjusted not to available supplies but to what little could be collected from the peasants. The weakness of the Vichy government and its unpopularity made its control measures rather ineffective. Thus, at the end of World War II, city food rations in France were down to around 1,400 calories, among the lowest in western Europe.

Industrial workers were not only given preference in the rationed distribution of food but also benefited from special forms of feeding. The erection of armament factories at long distances from living quarters, the long working hours and the conscription of housewives led to increased feeding in factory canteens and other communal feeding places, especially in Germany. When the destructive air raids against German cities became intensive, civilian feeding from transportable kitchens was introduced. These took the form of motor-mounted kitchens, inland waterway vessels and especially equipped trains.

The Soviet Union.—At the outbreak of World War II the U.S.S.R. was making substantial progress in its planned

food production program. Greatest gains had been made in the production of grains and other crops; meats, fats and milk were still much less than the requirements for a balanced diet. Still the U.S.S.R. was following a policy of self-sufficiency that included a small volume of exports. Prewar food supplies were estimated to yield about 2,800 calories per caput daily, of which more than 65% was derived from cereals and less than 20% from animal products.

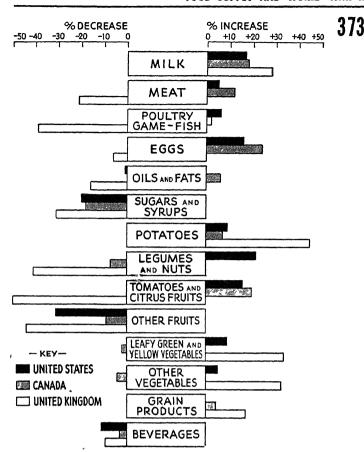

The food situation in soviet Russia deteriorated only slightly until the summer of 1942, when axis troops penetrated deep into its territory. Up to this time losses of territory had resulted in a considerable deficit of sugar and, to a lesser degree, of pork and lard, but bread grain supplies were not in serious danger. By Nov. 1942, however, the Germans were in control of new areas in the Don valley and most of northern Caucasia which, together with the Ukraine, supplied most of the requirements of the northern industrial centres and Transcaucasia. However, at the time of maximum German penetration in 1942 the food position in the unconquered soviet areas, though extremely difficult, was not yet critical. The 1942 crops in areas still under soviet control, plus state reserves, were sufficient to provide up to 85-90% of the bread grain and total feed grain supplies normally needed by the popula-

When the soviet counteroffensive swept into the western territories, the general food situation rapidly deteriorated and became critical. Between Nov. 1942 and June 1943 the soviet armies had reconquered a devastated area, containing close to 10,000,000 persons, where food supplies were critically short. By the spring of 1944 the soviet union had regained control of all the major agricultural regions whose surpluses in normal times had played a significant part in meeting the needs of the food deficit areas. However, this development proved a liability rather than an asset, and the rapid reconquest of formerly invaded areas only served to accentuate the government's food supply problem. These areas, notably the Ukraine and Byelorussia, had suffered some of the worst wartime devastations in any European theatre of war and were retaken only after the crops were harvested, thus giving the Germans time to increase the scale of devastation and to destroy what crops they could not remove during their retreat.

The loss of agricultural resources was the critical factor in the latter stages of World War II. The Russian "bread basket" was greatly affected by having about 40% of its prewar crop area overrun by the Germans. Further, this region produced about 80% of the sugar beets, 60% of the hogs and 40% of the cattle. As crop yields per acre in these regions were relatively high and contained a large share of high food value crops, such as sugar beet and oil-seeds, the loss in production was even greater than the acreage figures would suggest.

The losses in crop areas were paralleled by large-scale losses of livestock plundered, killed or taken away by the Germans. Livestock losses were reported to be 7,000,000 horses out of a total of 12,000,000 in the invaded territory; 17,000,000 cattle out of a total of 34,000,000; 20,000,000 hogs, 27,000,000 sheep and goats and 110,000,000 head of poultry.

No less serious was the loss of agricultural equipment, machinery and food-processing plants. According to soviet sources the machinery and equipment destroyed included 137,000 tractors, 49,000 combines and about 4,000,000 plows, harrows and other tillage implements. Losses of this magnitude were a real handicap to reconstruction of agriculture in eastern Europe.

Supply and civilian consumption of foodstuffs in 1943, as compared with prewar levels, for the U.S., Canada and the United Kingdom; adapted from charts prepared for the British Chiefs of Staff committee during World War II

United Kingdom.—The maintenance of a satisfactory national diet was one of the urgent problems that had to be faced by the United Kingdom. The fact that this was accomplished was a tribute to the ingenuity of the government, to the unselfishness of consumers and to the support of the other members of the British empire and its allies. Prior to World War II the United Kingdom imported two-thirds of the calories consumed and more than half the total proteins, more than half the meat, nearly all the fats, four-fifths of the sugar and about nine-tenths of the cereals and flour, as well as large quantities of feeds which were used in domestic production of meat, poultry, eggs and milk. These food and feed imports averaged 22,-000,000 tons yearly during the period 1934-38. While the sources of supply varied from year to year, approximately 4,500,000 tons came from the Argentine, 4,000,000 from continental Europe, 3,000,000 from Canada, nearly 3,000,-000 from Australia and New Zealand, more than 1,000,000 from India and Burma, 1,000,000 from the United States and 5,500,000 from other areas.

Although the government had made some purchases of sugar, wheat and whale oil under the Essential Commodities act of 1938, its food stocks in 1939 were at their normal peacetime level. The effect of these reserve purchases was merely to transfer to government financing the stocks which normally were held privately. In the first few months of World War II supplies to the United Kingdom continued to move freely, even from Denmark and the Baltic countries. However, by July 1940 the problem of

food imports became critical. Germany had control of the main continental European sources of food, cutting off supplies of 1,750,000 tons annually. These included a large proportion of the high-quality foods such as bacon and ham. butter, condensed milk and fresh eggs, normally imported. At the same time, Italy had entered the war, thereby disrupting the Mediterranean trade to the extent that supplies of dried fruit and other foods were cut off from eastern Europe and seriously curtailing food shipments from the middle east. The demand for ships for other war purposes did not permit the United Kingdom to increase materially its food shipments at that time from more distant producing areas. As a result, the national diet during the fall and winter of 1940-41 was changed greatly by reducing the amount of meat, fish, eggs, fats and sugar from 10% to 40% and, at the same time, by gradually increasing the consumption of grain products, vegetables, potatoes and milk when possible.

Simultaneously, the ministry of agriculture was making a concerted effort to secure maximum domestic production and to direct it toward food suitable for direct human consumption; and to replace the 7,000,000–8,000,000 tons of animal feeds which the United Kingdom had been importing annually. Pastures were plowed up, unused lands were converted into pastures, family gardens were encouraged, animal feedstuffs were rationed, production subsidies were granted and numerous other measures were taken. As a result, the United Kingdom by 1943 had attained its largest arable acreage in 60 years despite the loss of considerable area for airfields and other military purposes.

Japan's entry into World War II further intensified the British food supply problems by eliminating the normal

The aftermath of war in Nuernberg, Germany, with hungry civilians scouring garbage dumps in search of food

source for all the sago and tapioca, nearly all the pepper, half the copra and one-third the coconut oil. Of Britain's prewar supply of rice 80% was lost with the fall of Indo-China, Burma and Siam. Sources of sugar, tea and vegetable oils were lost with the Japanese occupation of the Netherlands Indies and the Philippines. The food situation reached its most critical position in the summer and winter of 1942 when the U-boat menace was at its peak. All available shipping space was needed for military operations, and supplies from overseas sources had not yet attained significant proportions. It was during this period that the extraction rate for flour, already raised to 75%, was increased to 85% and intensive campaigns were carried on to stimulate potato consumption.

The distribution and prices of essential foods were strictly regulated through all steps in the distribution chain from producer, processor, distributor, down to the individual consumer. This created a tremendous administrative task which was efficiently carried out. The government became the sole importer of foodstuffs and also acquired control over all home-produced food. Experts from particular food trades were appointed to the ministry of food to advise on the allocation, economic utilization of raw materials and processing of all foodstuffs. Special wartime associations or companies carried out commercial operations for the ministry which retained the ownership of almost every type of food down to the first stage of distribution. Food allocations were made in accordance with the number of retailers registered with each wholesaler, and in turn according to the total number of customers registered with the retailer. Foods for which registration was not required were distributed in proportion to prewar trade. Adjustments in allocations were made, where necessary, to keep pace with the wartime movements of population. At the same time, schemes for zoning, delimiting areas of distribution and rationalizing retail deliv-

eries were put into operation to effect economies in food transport. By establishing these controls the government was able to manage the nation's food resources in the interests of obtaining the maximum nutritional value from the available supplies and to maintain equitable distribution among consumer groups.

Rationing (q.v.), introduced in Jan. 1940, was primarily designed to ensure that supplies of essential foodstuffs at controlled prices were available to all types of consumers in all parts of the country.

By these and other measures the government ensured that the people were adequately fed. While the diet was monotonous and consumers were forced to forgo many of their favorite dishes, the net effect of this carefully planned and managed food program was that the wartime nutritional status of the population, especially the lower income classes, was improved over prewar levels, even though the average caloric value of the diet fell somewhat.

(For wartime food developments in the United States, Canada and in the British empire, see AGRICULTURE; DIETLITICS; LEND-LEASE; RATIONING.)

Far East.-The adverse effect of World War II on the food situation of the orient varied greatly in different countries at different phases of the war. The Japanese occupation of the rice-surplus countries of southeast Asia (Burma, Siam and Indo-China) deprived millions of persons in India and Ceylon of their marginal supplies of imported rice. Although India occupied an important place in the world of agriculture, its prewar production of food grains, even when supplemented by imports of 1,500,000 tons of rice from Burma, fell short of the nutritional requirements of the country. The export demand for the middle east and the military procurement reduced the supplies of rice and wheat available for civilian consumption. Failure of the rice crop in Bengal, shortage of transportation and administrative disorganization caused the worst famine in the history of the country with the reported loss of 2,000,000 lives.

A "Grow More Food" campaign was launched in India in April 1942 with significant results. After the Bengal famine the Indian authorities improved and extended the government procurement of food grains, established a system of planned movements of supplies from surplus to deficit areas, imported wheat as the shipping situation permitted and finally introduced rationing for the large cities and many small ones. The energetic measures taken by the government for conserving supplies and reducing the ration in 1945 averted a widespread famine in 1945-46.

World War II did not affect the food supply of China so greatly as might have been expected. Japanese occupation of the Chinese territories was fairly rapid, and the bulk of the food products was consumed in or near the areas of production. There were temporary shortages caused by battles or tying up of transportation for military operations. The breaching of the Yellow river dyke in Honan in 1938 by Chinese armies to stem the Japanese advance laid waste about 2,000,000 ac. in Honan and Anhwei. The greatest food shortage occurred in 1943 in Honan because of a drought and Chinese military requisitions. During the last stages of the war, acute shortages occurred in parts of Kwangsi, Kweichow and Honan.

The Japanese authorities took measures to improve the food situation of the occupied territories of Malaya, Indo-China, Indonesia and the Philippines by compelling greater production of food grains in plantations and other areas devoted to growing export crops and by importing

supplies from the rice-surplus areas of Burma and Indo-China. It was difficult to assess the degree of success of the measures taken to make the deficit areas self-supporting in food. As World War II progressed, it became increasingly difficult for the Japanese authorities to move rice from surplus to deficit areas, with the result that the food situation in the latter became more and more acute. The Japanese occupation made the inter-island communication and transport of foodstuffs difficult in Indonesia and the Philippines and resulted in local shortages. A lack of export demand, scarcity of fertilizers, shortage of incentive goods, destruction or damage of farm implements and conversion of rice mills to war uses during the Japanese occupation ruined the rice industry of Burma and Indo-China.

The food situation in Siam was comparatively better during World War II, and that country was the first to emerge after the Japanese surrender as a substantial exporter of rice.

Other Regions.—Increased food demands and trade dislocations encouraged the modernization and expansion of agriculture in parts of the regions less directly affected by hostilities, such as the middle cast, Central and South America, Africa and certain British, Dutch and French possessions. Much of the increased output was absorbed by the local populations, with the augmented purchasing power resultant from higher industrial activity. Thus, agriculture in most of those areas profited by World War II. So did many classes of consumers who, for the first time, were able to obtain more and better food.

The middle east did not feel the effects of World War II until 1940. That region, which normally exports cotton, nuts, fruits, grains, onions, tobacco and mineral oil, had supplied the United Kingdom with some foods earlier and in some instances were successfully trading with the axis countries. When Italy entered the war and disrupted Mediterranean shipping, the economy of the middle east became greatly disorganized. Egypt, Palestine, Syria and Lebanon, for example, lost their foreign trade and the governments had to assume control of the distribution of fertilizers, kerosene and sugar to avoid hoarding and profiteering. A ministry of supplies was created in Egypt, and similar agencies were organized in every country.

In 1941 the British and United States governments created the Middle East Supply centre (M.E.S.C.) to supervise the movement of food and other products to countries of the middle east, to increase their production of foodstuffs and to obtain, wherever possible, some food supplies for the Allied armies. The M.E.S.C. developed a regional food policy which succeeded in averting serious shortages in deficit areas, and which enabled the middle east to furnish considerable supplies for export to Europe, to contiguous countries and to the huge armies standing from the Caucasus and Mesopotamia to the Nile valley, the Sahara and the Red sea. This was accomplished in the face of the traditional mistrust of the farmers toward foreign governments. The middle eastern farmer regarded war as an armed conflict between foreign interests at his own expense. His natural reaction was to hoard as much foodstuffs, grains and gold as possible.

In parts of Latin America, where the feudal latifundia system of land ownership still predominated, and many countries were restricted to monoculture farming, World War II caused a noticeable reorientation of agriculture. At the outbreak of the war, a large demand for oils and

fats and livestock products arose, particularly within countries where industry had expanded to supply the Allied war effort. As food supplies grew tighter in nearly all countries, emergency decrees and laws fixing prices, regulating exports, freezing land rentals and restricting distribution of critically scarce commodities were frequently adopted. Agreements of reciprocal assistance to solve particular problems grew more widespread, and exports between the various Latin American nations expanded considerably. Between 1940 and 1943, for example, exports of livestock from Chile to other South American countries nearly doubled. As production gradually increased, many nations were able to change from a food import to a food export basis, as did the Dominican Republic in the case of rice.

Before World War II, some Latin American nations imported much edible oil and the entire continent was a net importer of rice. As wartime shipping shortages disrupted this trade, rice production in Brazil, Chile, Ecuador and the Dominican Republic expanded greatly. To offset the loss of olive oil from the Mediterranean region, and vegetable oils from southeastern Asia, Brazil and other nations increased peanut, babassu and sunflower output and the quantity of cotton seed crushed.

Postwar Period

Early in World War II it was recognized that the collapse of the axis powers would probably disrupt the economy of occupied countries and bring millions of persons to the verge of starvation. This led the United States and a number of other governments to give consideration to postwar problems of relief and rehabilitation. An inter-allied committee on postwar requirements was established in London to stimulate and help co-ordinate intergovernmental studies of these problems and especially to assess the requirements of each European country during the first 18 months after liberation and determine possible sources of supplies of relief foods, agricultural equipment and supplies, clothing and other commodities. Similarly, the allied military commands made plans for meeting urgent civilian food relief problems during the immediate period of liberation before other types of organized relief could be established in the area.

The United Nations Relief and Rehabilitation administration (U.N.R.R.A.) (q.v.) was established in Sept. 1943 and soon became the centre for further programming of relief supplies. By agreement, its operations were concerned largely with displaced persons and with those occupied countries of Europe and Asia which were unable to pay for their imports of essential commodities.

Starting operations during a critical phase of World War II, U.N.R.R.A. was confronted with many problems and obstacles in obtaining adequate supplies of foods. While all governments agreed that large quantities of food would be required for relief, they were reluctant during the war to earmark supplies for this purpose or to make sizable food allocations to U.N.R.R.A. which could be purchased and held in reserve until needed. Those who supported this policy argued that all the available foods were needed for current military and civilian consumption and that none could be spared for building up relief stock piles for use at some uncertain date in the future. They argued further that, when needed, adequate relief supplies could probably be obtained from current production and stocks because military and other urgent civilian requirements would taper off at the end of World War II.

Back of many of these arguments was the ever present fear that the major food-producing countries would be left with huge surpluses should the war end suddenly.

The net effect was that U.N.R.R.A. was continuously handicapped in its relief operations and that a sizable volume of grain and other foods that could have been reserved for relief purposes early in World War II were depleted in fattening livestock, in the production of alcohol and in maintaining a higher level of civilian consumption than was necessary. When the time came to meet food relief requirements out of current production and stocks in 1944, 1945 and 1946, crop production in the southern hemisphere was reduced by drought, grain stocks were down to the danger level, high civilian purchasing power in many countries was creating pressure for more foods and encouraging extensive black market operations; all these situations, combined with the continued high military requirements, served to make it impossible to divert as large quantities of food for relief purposes as were needed. Notwithstanding these handicaps, U.N.R.R.A. managed to procure and distribute sizable quantities of food in Europe and China and thereby help avoid mass starvation in many cities.

The initial U.N.R.R.A. field operations were centred in North Africa and Italy, where special attention was given to the problems of displaced persons. Later its food relief and agricultural rehabilitation program was extended into 18 different nations and areas. By the end of 1946 U.N.R.R.A. had shipped more than 6,000,000 tons of food, valued at nearly \$1,000,000,000 and about 1,700,000 tons of agricultural rehabilitation supplies valued at more than \$100,000,000. Approximately 72% of its food was exported from the United States. Grain accounted for 67% of all U.N.R.R.A. food shipments and high protein foods, including meat, soya products, fish, dairy products and fats and oils, including soap, made up 20%. The remaining 13% was largely fruits and vegetables, sugar and pulses.

Italy received more food than any other individual nation, getting more than 1,000,000 tons of grain and more than 300,000 tons of other foods. Greece was the next largest recipient, with nearly 1,000,000 tons of grain and about 300,000 tons of other foods. Yugoslavia, China, Czechoslovakia, Poland, Russia (Byelorussia and the Ukraine) and Finland, together with the 2 nations just mentioned, received 95% of all U.N.R.R.A. food shipments.

The bulk of U.N.R.R.A.'s funds for food procurement was derived from the United States contribution, which, as of Sept. 30, 1946, constituted 73% of all funds received. However, proportionate contributions were made by 29 of U.N.R.R.A.'s 31 other noninvaded member governments.

Urgent Problems.—The cessation of hostilities introduced a host of difficult problems of food production, distribution and management both for the liberated countries and their allies. The needs of 750,000,000 more people had to be considered in the allocation and distribution of available food supplies. The termination of lendlease and mutual-aid programs created new financing problems. Demobilization and reconversion contributed to the shipping and transportation bottlenecks. High civilian purchasing power and inflation in many countries coupled with a general reaction against wartime controls increased the difficulties of managing and conserving the available food resources and of making equitable allocations to needy areas. Food production in the major exporting countries had to be maintained at maximum levels while scarce supplies of fertilizer, machinery and other production goods had to be shared with the liberated countries. New political frontiers created obstacles to the movement of food and agricultural supplies between areas. Hoarding and speculation disrupted rationing systems and encouraged black market operations.

In Europe the process of liberation and the subsequent economic breakdown was far more destructive to agriculture than was the German invasion. As a consequence, food production in 1945 had declined to a level of some 20% less than prewar. Even those areas which had maintained relatively high levels of output during World War II experienced a sharp drop in yields as a result of reduced supplies of fertilizers, seeds, workstock, machinery and labour. Some areas were especially affected by the dislocation of rural population, the disruption of transportation and the destruction of the land.

The battles fought in the U.S.S.R., Italy, France, the Netherlands, Poland, Germany and the southeastern countries had destroyed farm buildings, livestock and equipment and covered large areas with minefields. In the Netherlands, where people for centuries had been busy reclaiming land from the sea, the German army had inundated about 220,000 ha., (543,400 ac.) of which about 77,000 ha. (190,190 ac.) were flooded with salt water. Much land remained uncultivated in Greece and Poland, where almost a third of the villages were destroyed, and in Yugoslavia, where war and civil war had prevented many peasants from returning to the land. The expulsion of the population from Germany's agricultural surplus area east of the Oder and Neisse rivers brought agricultural production to a standstill in a region which had produced 25% of Germany's food supply. Severe drought in central and southern Europe and shortage of agricultural equipment in Russia helped reduce the grain crop to one-half of normal.

The surrender of Japan brought another large segment of the world's population of the far east into the position of "claimants" for a share of the already limited food supplies. This area, despite its low levels of consumption, was a net exporter of foods prior to World War II, especially rice, sugar and vegetable oils. But Japanese occupation, adverse weather conditions, shortages of fertilizers, seeds and draft animals, dislocations of transport and economic interferences had reduced the 1945 output to the point where the far east became a net importer of foods.

These declines in production were large for most foodstuffs but were especially critical in the case of cereals, particularly rice. It was estimated that 150,000,000 tons of rice (paddy basis) would have been required to give the 1,100,000,000 persons in the area a level of consumption equal to that of prewar. Actually, however, it produced less than 118,000,000 tons of rice in the crop year 1945–46. Most of this reduction took place in Burma, Indo-China, Korea and Formosa, the areas which exported large quantities of rice before World War II. Production of oils and sugar in the Philippines, East Indies and other Pacific areas likewise was reduced to a fraction of their prewar levels.

World Food Crisis.—The cumulative effects of low indigenous production in liberated areas, of droughts in the southern hemisphere and the disappearance of food stocks in the food-exporting countries following the relaxation of government controls, all served to bring the world face to face with a major food crisis during the winter of 1945–46. Despite their all-out production efforts, the food-exporting countries could not offset the reduced output resulting from six years of war. As a consequence, the per caput world food supply available during the

consumption year 1945-46 was from 12% to 15% less than prewar. Shortages of this magnitude, while serious from a world point of view, would not have precipitated a major food crisis had the available supplies been equitably distributed. But this was not the situation. Rather, food consumption in many countries was being maintained at per caput levels close to, and often above, prewar levels, while consumers in war-devastated areas, especially those in urban centres, were frequently existing on supplies equal to one-half or two-thirds of prewar. In the United States, for example, the 1945-46 consumption was approximately 15% higher while, in contrast, parts of Asia were as low as 60% of prewar consumption.

The urgency of this situation prompted the Food and Agriculture organization of the United Nations to call a special meeting of governments in May 1946 for the purpose of taking international action to cope with the food emergency. This meeting not only helped clarify the picture with respect to the character and extent of distress but, in addition, led the governments to establish the International Emergency Food council. This council, which replaced the Combined Food board, was enlarged to include all important food-importing as well as food-exporting countries and was given the task of allocating food supplies during the existence of the world food emergency.

U.N.R.R.A. likewise played a very important role in helping meet the food emergency in Europe and China by delivering about 60% of its total relief foods during the consumption year 1945–46. Individual nations such as the United States and Canada made a concerted effort to move large quantities of wheat into the deficit zones. England and other food-importing countries held their requests for allocation to a minimum so that more foods could be made available to the more distressed areas. Through the combined efforts of many governments and these international organizations the food crisis was kept from reaching famine proportions.

The World Food Balance in 1946.—More favourable crop conditions in the southern hemisphere and a slight recovery of agriculture in war-ravaged areas resulted in slight improvements in 1946. However, wide disparities still existed in the distribution of available supplies. For some countries, the food deficiencies during the consumption year 1946–47 were fully as critical as the previous winter.

The most critical deficits existed in Europe and Asia, where supplies of fats and oils, bread grains, rice and sugar were still very low. Production of wheat and rye in 1946 was about 12% more than the small crop of 1945–46 but about 95% of prewar. The 1946 rice crop exceeded the previous harvest by about 10% but remained only about 90% of prewar. Sugar output was about 10% more than in the preceding year but 14% less than before World War II. World production of visible fats and oils available for consumption was estimated at about 83% of prewar.

The food position of individual countries, measured in terms of calories available during the consumption year July 1946–June 1947, is summarized in the accompanying table. It should be noted that these data are national averages and conceal important variations in consumption within each country and between various consumer groups. These disparities, which were greater in 1945 and 1946 than they were during World War II, represented an important hidden element in the food situation that was

Football

Football, the most popular of all U.S. athletic games on the basis of public patronage, was a mighty oak on the sporting scene in the ten years from 1937 through 1946. The strength of its roots and its hold on the public were amply demonstrated during this trying period. The effects of the worst depression in history were still being felt in the late '30s, and then the United States found itself caught up in the greatest catastrophe man had brought upon himself.

All sports during this period felt the pinch of stringencies, and some of them had to give up. Baseball during the depression introduced night play as a means of attracting workers through its turnstiles, and during the war added to the number of games played under arc lights when "brownout" restrictions were lifted. A number of sports gave up the ghost because of losses of playing personnel, a decline in attendance and governmental restrictions.

Football carried on through the depression and the war years. Despite its many problems, which might have been too staggering to permit further operations had the war not been brought to an end in 1945, it was never

threatened with insolvency. Receipts fell off at times, and retrenchment and pruning were called for in preparing budgets.

Some colleges dropped out, primarily because of manpower shortages. But the great majority of the teams continued to function without a lapse. Some of them enjoyed as prosperous years as they had ever known, and there were teams that attracted 500,000 spectators, or close to that number, for their season of 10 games.

After a marked decline in attendance in 1942 and 1943, public interest picked up. In 1944 and 1945, many schools broke all-time records in receipts, and in 1946 football enjoyed its greatest prosperity in history as thousands of former stars returned to the campus from the service ranks to raise the calibre of

the play back to the formervarsity standard.

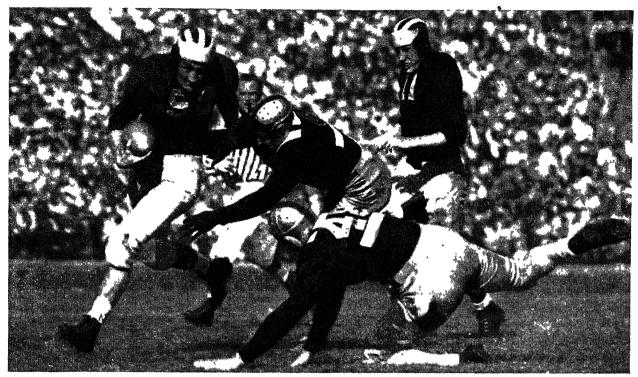

Argentina

New Zealand

Like baseball, football provided a beneficial relaxation for the public from the strains of war. The quality of the play dropped sharply after 1943, as the stars were taken by selective service. The calibre of the game generally was not much above the level of freshman competition, with 17-year-olds and players physically disqualified for the draft in the 4-F classification manning the ranks. Nevertheless, the games were as exciting as ever. Great teams continued to arise, notably Army's invincibles of 1944, 1945 and 1946, with the most celebrated pair of backs of modern times—Felix "Doc" Blanchard and Glenn Davis—and the public filled the stadia; crowds often exceeded 60,000, sometimes 70,000 and in cases, 90,000 and even 100,000.

The worth of football was proved in the fighting ranks. Football players did not have a monopoly in winning battle decorations or showing high qualities of leadership. Nor was this a monopoly for athletes in general. Men who had had no association with sports showed as much leadership and initiative as those who had made the headlines of the nation's press with their feats on the gridiron, the diamond, the cinder paths, the tennis court, the polo field and the golf course. But football players distinguished themselves in unusual numbers in all branches of the service and particularly in the air arm. The 1926 eleven of Army, in particular, had a brilliant record and suffered heavy casualties, including Brig. Gen. Rosy O'Donnell, who came close to losing his life as leader of the 20th bomber command of Superfortresses.

Service Men and "Civilian" Teams.—West Point became "sold" on football during the war years as never before. It emphasized the value of football with its stressing of team play and the sacrifice of the individual for the good of the whole command or organization, its development of initiative and quick thinking under fire, as inculcating the virtues that make for good officers. There was some

Tom Harmon scoring for Michigan against Michigan State at Ann Arbor in Oct. 1940. Michigan won 21 to 14, with 3 touchdowns by Harmon, outstanding player of the year and winner of the Heisman and Maxwell trophies

criticism that Army was going too far in attracting stars of the gridiron from other schools, but West Point answered that it was seeking the best candidates possible for its cadet ranks and that men who excelled on the football field were the finest kind of officer material.

Navy took the same attitude. It was a Navy man, Capt. Thomas Hamilton, who, more than any one else, made it possible for football to continue during the war years. A brilliant player and then a successful coach at Annapolis, Capt. Hamilton advocated keeping football going as the finest kind of preparation for young men entering the service. There were those who argued that competitive athletics had no place in the scheme for training the young men who were going into the army, navy and marine corps, that there was not time enough for team sports in view of the great masses who had to be conditioned.

Hamilton won his fight. In the navy preflight schools that were organized, he installed the physical training program of which football was an important part. Famous coaches were commissioned and put in charge of the squads, and the preflight teams were among the best, playing most of their games with college elevens.

It was in the colleges themselves that Hamilton's program was especially important. Through his advocacy, navy trainees who were sent to the colleges were permitted to participate in varsity sports, including football. It was these trainees who made it possible for intercollegiate athletics to carry on. Without them, sports would have been impossible except on an informal, intramural basis, for there was not the civilian manpower on the campus to provide the material in 1943 and 1944. Indeed, many colleges would have had to close had not the army and navy sent their officer material to them for training in the classrooms.

The army adopted a different attitude toward sports. It did not permit its trainees to engage in varsity competition. Those colleges with army units had to give up football in most instances, though a few carried on with youths who were under the draft age or had physical disabilities. Those with navy units continued to put teams on the field, and the navy and marine trainees composed three-quarters of the squad and furnished most of the stars at most institutions.

After 1943, the big-name stars disappeared from the ranks of the navy trainees. By the end of that year they had gone on to advanced training bases or to the fighting fronts. The new trainees coming in in 1944 and 1945 were unknowns, most of them without previous college football experience. As a consequence, there was a sharp drop in the strength of the teams and in the calibre of football.

Coaches, handicapped by undermanned staffs and short practice sessions that had to fit in with navy programs on the campus, were working with players who were extremely young and inexperienced—the equivalent of freshmen. With the exception of Army and Navy, whose cadets and midshipmen were not subject to the draft and who were bringing in stars from other colleges, every team felt the pinch and suffered a letdown in quality.

Notre Dame, which had one of the finest teams in its history in 1943, offered a typical example. The Fighting Irish suffered their most humiliating defeat in history in losing by 59-0 to Army in 1944 and also were outclassed by Navy. In 1945 they were overwhelmed by Army again by 48-0 but came off with a tie score against Navy. Their coach, Frank Leahy, went into the navy after the 1943 season, but even had he been in charge the next two years Notre Dame could hardly have given Army a close fight, so great was the disparity in the experience and ability of the manpower.

Notre Dame's 1943 eleven and Earl Blaik's Army invincibles, who went through the seasons of 1944, 1945 and 1946 without defeat, winning 27 of 28 games and playing to a scoreless tie with Notre Dame in the other (in 1946), were the two great college organizations of the

war period. They ranked with the best football teams of all time, even though the Fighting Irish were defeated in the last half minute of their final game, with Great Lakes Naval Training station, on a long, last-ditch pass. Angelo Bertelli, who was quarterback until called into active service by the marine corps after the game with Navy, and Johnny Lujack, who succeeded him for the rest of the season, were two of the biggest names in football during this period.

The shining lights above all others, however, were Army's Blanchard and Davis, known as "Mr. Inside and Mr. Outside," or "B. and D."

Prior to the war, the standout teams were Pittsburgh and California in 1937, Texas Christian in 1938, Texas A. & M., Tennessee (unscored on in 23 successive games) and Cornell in 1939; Minnesota, Stanford's masters of the T formation, and Tennessee in 1940; and Minnesota, Duke and Leahy's first Notre Dame eleven, the first to go through unbeaten since 1930 in 1941.

Stars and Coaches.-The most famous players of the period included Clinton Frank of Yale, Byron (Whizzer) White of Colorado, Davy O'Brien of Texas Christian, Marshall Goldberg of Pitt, Nile Kinnick of Iowa, Tom Harmon of Michigan, Clark Hinkle of Vanderbilt, Jack Crain of Texas, Brud Holland of Cornell, Bob MacLeod of Dartmouth, Sid Luckman of Columbia, Ki Aldrich of Texas Christian, Paul Christman of Missouri, George Cafego of Tennessee, Nick Drahos of Cornell, Banks Mc-Fadden of Clemson, John Kimbrough of Texas A. & M, Frankie Albert and Norman Standlee of Stanford, Ed. Doherty of Boston college, Augie Lio of Georgetown, Bruce Smith of Minnesota, Bill Dudley of Virginia, Bob Reinhard of California, Frank Sinkwich of Georgia, Paul Governali of Columbia, Otto Graham of Northwestern, Angelo Bertelli, Creighton Miller and Jim White of Notre Dame, Bob Odell of Pennsylvania, Eddie Prokop of Georgia Tech and Bill Daley of Minnesota and Michigan.

Others, besides Blanchard and Davis of Army, included Les Horvath of Ohio State, Bob Kelly of Notre Dame, Don Whitmire and Bob Jenkins of Navy, Buddy Young of Illinois, Bob Fenimore of Oklahoma A. & M., Paul Walker of Yale, Herman Wedemeyer of St. Mary's (Calif.), Harry Gılmer and Vaughn Mancha of Alabama, Pete Pihos of Indiana, Clyde Scott, Dick Scott and Leon Bramlett of Navy, Tex Coulter, Hank Foldberg and Arnold Tucker of Army, Charley Trippi of Georgia, Johnny Lujack and George Strohmeyer of Notre Dame, Fritz Barzilauskas of Yale, Frank Wydo of Cornell, George Savitsky of Penn, Hub Bechtol and Bobby Lane of Texas, Burr Baldwin of the University of California at Los Angeles, Warren Amling of Ohio State, John Ferraro of Southern California and Charley Justice of North Carolina.

Coaches who distinguished themselves during the tenyear period included Frank Leahy, Earl Blaik, Clark Shaughnessy, Dr. Eddie Anderson, Bill Alexander, Alonzo Stagg, Bo McMillin, Carroll Widdoes, Bernie Bierman, Bob Neyland, Fritz Crisler, Bill Kern, Hooks Mylin, Frank Thomas, Carl Snavely, Lou Little, Homer Norton, Dutch Meyer, Jock Sutherland, Jim Crowley, Henry Frnka, Jack Haggerty, Wallace Butts, Wallace Wade, Stub Allison, Howard Jones, Lon Stiner, Biff Jones, Bert LaBrucherie.

Leahy, coming out of obscurity to the post of head coach at Boston college in 1939, turned out teams that lost only one game in his two seasons there. Going to Notre Dame in 1941, he developed the first undefeated eleven at South Bend since 1930, Knute Rockne's last year,

and was voted the coach of the year. He turned out the champion team of 1943 before going into the navy.

Shaughnessy, in his first year at Stanford, developed one of the most exciting teams of modern times. With George Halas, owner and coach of the Chicago Bears, he worked out the T formation that was to become the vogue in a few years. They revived the old T, from which Notre Dame had shifted into its box formation. They introduced the back in motion and gave football its fastest-striking attack, with the quarterback, stationed under centre, handing off the ball to halfbacks and fullback starting with darting speed on quick opening plays. Man-for-man brush blocking, lateral shuttling of the ball and pitch-out passes were features of the attack, in which the key man was the quarterback, who did almost all of the passing and handled the ball almost without exception

Shaughnessy's Stanford team, with standouts in quarter-back Frankie Albert, fullback Norman Standlee and half-back Pete Kmetovic, defeated all opponents while the Bears were winning the professional championship. The brilliant success of these two teams with the T awakened the country's coaches to the possibilities of the new formation, though it was not until 1942 that the swing toward it and away from the single wing and the Notre Dame box definitely got under way. Shaughnessy was voted the coach of the year.

Anderson, after conspicuous success at Holy Cross, went to Iowa in 1939. The Hawkeyes had finished at the bottom of the Big Nine conference the year before. Anderson worked such a change that they lost only one game and numbered Notre Dame and Minnesota among their victims. He was voted coach of the year, and Nile Kinnick, who was to lose his life in the war, was named the player of the year.

Crisler, going to Michigan in 1938 after a fine record at Princeton, built a team that lost only to Minnesota, and that by a point after touchdown. The coaching award of the year, however, went to Bill Kern of Carnegie Tech.

Alexander, one of the coaches longest in the game and one of the most respected, received the coaching award in 1942 at the end of his 23rd year at Georgia Tech, two years before he retired. Stagg, the grand old patriarch of football, who refused to be retired after more than 40 years at Chicago and went to the College of the Pacific. was honoured in 1943. Widdoes, in his first year at Ohio State, where he took charge after Paul Brown went into the navy, brought the Buckeyes through unbeaten to the Western conference championship in 1944. He was named the coach of the year and his quarterback, Les Horvath, was named the player of the year and received the Heisman trophy. McMillin in 1945 gave Indiana its first undefeated team and its first Western conference champion in the 46 years it had been in the organization.

Blaik, as coach of the greatest team in Army history, as well as of Dartmouth's undefeated eleven of 1937, rated among the most honoured men in his profession. His Army machine of 1944, 1945 and 1946 proved its greatness both in war and peacetime. Its record of 27 victories and one tie stood among the finest in football. A master of the single wing attack of the Pittsburgh type with deep reverses, he went over to the T at West Point and developed one of the best offenses of its kind in football, with one of the fastest halfbacks the game had ever known, Glenn Davis, to reap the most of its speed possibilities.

Bierman gave Minnesota six conference champions in a period of eight years and was the top man in the Big

Ninc, if not in the country before he went into the Marine Corps. Thomas at Alabama, Wade at Duke and Neyland at Tennessee were the triumvirate of the south, and Sutherland was one of the hardest men in the country to beat when he was at Pitt, as Howard Jones was at Southern California. Jones's teams never lost a game in the Rose bowl, in which they played five times.

Teams of the Decade.—Sutherland's 1937 Pittsburgh eleven was ranked as the best in the country, though Stub Allison's California Bears were called a "wonder team" and went through the season unbeaten. Fordham, Alabama, Dartmouth and Santa Clara also were undefeated. The Panthers and Crowley's Fordham Rams played to a scoreless tie, their third in succession against each other. California defeated Alabama in the Rose bowl.

Dutch Meyer's Texas Christian eleven was given top rating in 1938, followed by Tennessee, Duke, which was unscored on; Southern California, Notre Dame, Carnegie Tech and Oklahoma. With Davy O'Brien at quarter and Ki Aldrich at centre, the Horned Frogs won all ten games and defeated Carnegie in the Sugar bowl. In the Rose bowl, Southern California won from Duke.

Texas A. & M. coached by Homer Norton, duplicated Texas Christian's record in 1939 to win the number one spot, though Tennessee, unscored on in 23 successive games, was a strong rival for the honours. Southern California, Cornell, which furnished one of the year's big victories at the expense of Ohio State, and Tulane were other undefcated leaders. Southern California won from Tennessee in the Rose bowl, and Texas A. & M. defeated Tulane in the Sugar bowl.

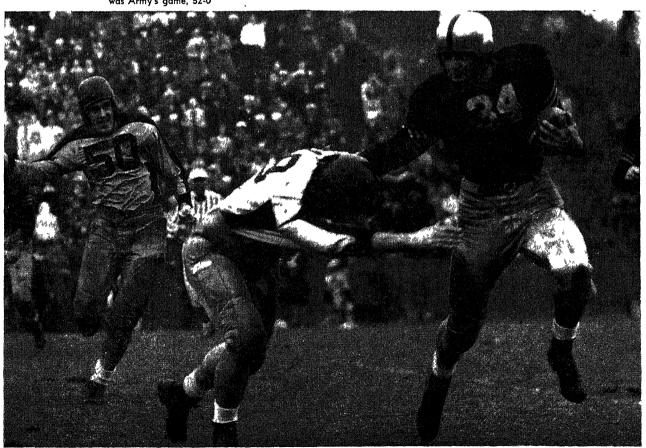

Minnesota, Stanford, Michigan, Tennessee and Boston

Glenn Davis (34), outstanding Army halfback, carrying the ball in a 4-yd. gain against Columbia at New York city in Oct. 1943 It was Army's game, 52-0 college, all undefeated except Michigan, were the leaders in 1940. Minnesota, with its difficult schedule, was generally rated the top team, although Stanford, with its T formation, was the "glamour" eleven. Tennessee went through its third successive season without a defeat or a tie under Neyland. That was the year of the famous fifth down. Cornell, undefeated in 18 successive games, was trailing Dartmouth by 3-0. On the last play it completed a pass for a touchdown, to win by 7-3. It turned out that Snavely's Big Red team had been given a fifth down, whereupon Cornell conceded the victory to Dartmouth. That same day Leahy's Boston college team ended Georgetown's long winning streak in one of the best games of the year, winning by 19-18.

One of the biggest surprises football had experienced in years came when Texas A. & M. was upset in its final game by Texas. Stanford was the victor over Nebraska in the Rose bowl and Boston college over Tennessee in the Sugar bowl.

Minnesota was again ranked at the top in 1941 as it ran its winning streak to 17 games. Duke and Notre Dame, both unbeaten, had the next best records. Texas was rated as the best team in Longhorn history but met with a stunning setback in its tie with Baylor and then a loss to Texas Christian. Fordham, after winning its first five games, lost to Pittsburgh, which had been beaten five times.

The attack on Pearl Harbor in Dec. 1941 threatened to put an end to the postseason games. War department regulations made it impossible to hold the Rose bowl game at Pasadena, and the game was transferred to Durham, N.C. There Duke played Lon Stiner's Oregon State eleven

and was unexpectedly beaten. Fordham, the leader of the east, defeated Missouri in the Sugar bowl. In the Cotton bowl Alabama won over Texas A. & M., and Georgia defeated Texas Christian in the Orange bowl.

The season of 1942 saw football facing an uncertain outlook. Leading coaches were going into the service; small colleges were giving up the game. Freshmen were made eligible for varsity play to offset the loss of men going into the army and navy. Dimout regulations near the coastlines curtailed practice. Rationing of gas and rubber and the barring of railroad specials cut down heavily on travel, and the size of the crowds at the games fell off. There was a drop of 19% in attendance. Some of the colleges in small communities moved their big games into large cities. Princeton played three games in New York and met Yale at Columbia's Baker field.

The Army-Navy game was ordered to be played at Annapolis, with ticket holders limited to residents within a 10-mi. radius. Less than 12,000 saw the game instead of the usual 100,000 who turned out in Philadelphia. However, 95,000 saw Notre Dame and Southern California play at Los Angeles. Many service teams sprang up to take the place of colleges which were dropping out. Great Lakes and the Iowa Preflight Seahawks were the best of these, and the army air forces put a number of strong teams on the field.

Tulsa, under Frnka, was the only major team to go through the season unbeaten. Boston college, supposedly the best of all, was the victim of an upset by Holy Cross, and Georgia Tech was toppled by Georgia on the final day of the season.

Ohio State was generally ranked first. Georgia, Wisconsin, Tulsa, Georgia Tech, Notre Dame, Tennessee and Boston college followed. Georgia defeated U.C.L.A. in the Rose bowl and Tennessee won from Tulsa in the Sugar bowl. In the Orange bowl, Alabama was the victor over Boston college, and Texas defeated Georgia Tech in the Cotton bowl.

The year 1943 saw a number of big powers drop out as the draft cleared the campus of manpower. They included Fordham, Stanford, Alabama, Tennessee, Florida, Mississippi, Mississippi State, Syracuse, Georgetown, Santa Clara, Oregon, Oregon State and Washington State. Harvard, Boston college and Vanderbilt carried on informally. The navy trainees in the colleges were keeping the game alive, but transfer of these service men at midterm did strange things. Some of the trainees played in the second term against the team they had played for during the first half of the season. A few of them found themselves playing against their alma mater of peacetime. Some of the transferees played twice against the same team in the same season.

Again the Army-Navy game was restricted, this time to West Point. Attendance generally fell off another 18%, but huge crowds continued to turn out at the big games. Notre Dame and Michigan played to 86,000. Notre Dame was ranked the number one team. It was followed by the Iowa Seahawks of Bierman, against which it had a narrow escape; Michigan, Navy, Purdue, Great Lakes and Duke.

The Rose bowl game of 1943 was played between Southern California and Washington. Because of travel 1 testrictions, the Pacific Coast conference had been divided into two groups, each limiting its games to its own section. The winners in the north and the south met in the Rose bowl to determine the conference champion, and Southern California won. In the Sugar bowl, Georgia

Tech defeated Tulsa.

The future of football seemed dark indeed in 1944, but the game carried on. The quality of play fell off markedly, but the crowds came out in big numbers to see the 17-year-old freshmen and the 4-Fs play. There was a 14% rise in attendance. The Army-Navy game was held as a war bond promotion event in Baltimore.

Army was by far the standout team as it went through its first perfect season since 1916, rolling up 504 points to 35 for the opposition and defeating Notre Dame for the first time since 1931 with its 59-0 rout. Navy was supposed to be stronger than Army but met with early reverses and then came on strong. It barely lost out to Ohio State for second place in the national ranking. Ohio State had a perfect record with its all-civilian team and won the Big Nine championship. Southern California, Michigan, Notre Dame, Duke, Tennessee and Georgia Tech were other leaders. Yale went through its first season without defeat since 1924. Southern California defeated Tennessee in the Rose bowl and Duke won from Alabama in the Sugar bowl. The Randolph Field Ramblers and Bainbridge Naval Training centre were the strongest service teams. The Ramblers defeated the 2nd air force Superbombers for the championship of the army air forces.

In 1945 the whole picture of intercollegiate football changed. The war was at an end. A few former stars had started to trickle back in 1944. Now they were returning in larger numbers, some of them being invalided out of service and recovering from war wounds in time to play. Colleges that had given up the game were returning to the fold, notably those in the Southeastern conference. Coaches were also coming back from the service. They included Dick Harlow at Harvard, Tuss McLaughry at Dartmouth, Wallace Wade at Duke and Bernie Bierman at Minnesota.

The Intercollegiate Football Rules committee met for the first time since the United States entered World War II. During the war, the chairman of the committee, Bill Bingham of Harvard, was serving in the army, and the rules were frozen for the duration. Now the solons held session and put through one highly important change. They permitted the forward pass to be thrown from any point behind the line of scrimmage, as in professional football, doing away with the five-yd. restriction. This was a big boon to the attack and particularly to the T formation.

The T formation had definitely become the vogue by 1943, when Army, Notre Dame and Ohio State adopted it. There was a clamour for changes in the rules that year, and when they were not forthcoming the east and the far west colleges decided to make their own changes. They were particularly determined upon putting an end to the growing practice of kicking off out of bounds to prevent the receiving side from running the ball back, and it was left optional with opposing teams to decide whether or not to permit passing from any point behind the line.

The coaches returning from the service in 1945 found that the T formation had supplanted the single wing and the Notre Dame box at all but a few schools. In fact, there was already an advance from the T in the devising of a formation that combined the T and the single wing. At Columbia, Lou Little called this the wing-T formation. Ohio State and Michigan used both the T and the single wing.

The defense was devising a variety of alignments to catch up with the T. Five-man lines were becoming common, but the defense was never static. It was changing to a six or a seven-man line that slid or looped, and doing everything possible to disturb blocking assignments. Be-

cause of the advances on the defense, coaches were trying to work out something new in 1946. Harlow introduced the L formation, which amounted to a single wing with the quarterback stationed four yd. back of his strong side end, instead of the blocking position. By moving the quarterback over to flank his weak side end, he made a double wing formation. Harlow also used the T.

To get back to 1945, interest picked up even more than in 1944, with the calibre of the play improving as old favourites came back to the game from the service. Huge crowds turned out. Attendance was up 35% and records were broken. The Army-Navy game was restored to the Philadelphia Municipal stadium, where more than 100,000 saw Blaik's Black Knights defeat the midshipmen. President Truman and his family attended the game and there was a large gathering of war heroes of flag rank, who had been missing from the scene four to five years or more. On the same day 103,000 saw Southern California and U.C.L.A. play in Los Angeles.

Army was again the standout team as it ran its string of victories to 18. It was the first time a West Point eleven had ever gone through two seasons without defeat. Blanchard and Davis became the talk of the nation more than ever as they led the Army charge in crushing victories over Notre Dame and Pennsylvania, turned back the challenge of Michigan and all others and put over three touchdowns in the first half against Navy to sew up the game.

Navy was ranked as the second best team until, in the final poll, Alabama squeezed ahead by 942 votes to 941. The Crimson Tide had a perfect season and in Harry Gilmer a passer rated the best the south ever had seen. Indiana and Oklahoma A. & M. also enjoyed perfect records. Bob Fenimore of Oklahoma A. & M. was one of the great backs of the year and Indiana's Pete Pihos and Bob Ravensburg were among the best fullbacks and ends of the season. St. Mary's, unbeaten until its final game, was another strong team and its Herman Wedemeyer was ranked by some as the best back in college football. Michigan was another of the best teams and Columbia had its best season in years, losing only to Penn.

Southern California was beaten for the first time in the Rose bowl when it lost to Alabama, 34-14. In the Sugar bowl Oklahoma A. & M. defeated St. Mary's.

Talent Glut.—In 1946, football had its most prosperous season in history and also one of its most exciting. Thousands of former stars, going back as far as the season of 1941, returned to the campus. On some teams players who had been key men in other years found it impossible to "make" the second or third eleven, such was the glut of talent. Many of these returning servicemen failed to come up to expectations. The war and the passing years had worked a change in their mental approach to the game and in their physical qualifications. Some of them had nothing like their old speed, because of the fact they had done so little running for so long. The failure of these players to measure up to their old form was largely responsible for the epidemic of upsets that came throughout the season.

On the other hand, many of the players took up where they had left off, and the quality of the football was vastly superior to what it had been. Army and Navy did not benefit by this movement back to the campus for the reason that they had not lost any of their players to the services during the war years. While other teams had their best squads in history, Annapolis and West Point suffered losses through resignations, chiefly at Navy, and picked up few replacements.

The public, eager for "big time" football again, turned out in unprecedented numbers. On one day early in the season 7 games drew a total of 500,000 fans. Notre Dame, Michigan, Pennsylvania and Army each played to 500,000 spectators. Record crowds gathered in every section, and most teams counted the biggest receipts they had ever known.

Army, with Blanchard and Davis holding forth again and Arnold Tucker proving almost as valuable with his passing and direction of the team at quarterback, continued to lead the parade and went through its third successive season without defeat. However, the cadets were held to a scoreless tie by Notre Dame in the game looked forward to more than any other of the season, and in the final poll, the Fighting Irish went ahead of West Point and were ranked the number one team. So Army finally was ousted from the pinnacle after being at the top continuously for three years, except for one week at the start of the 1946 season when Texas was voted number one.

The ousting of Army came as a result of its narrow escape against Navy in the final game, witnessed by 100,000 spectators including President Truman and a distinguished gathering of cabinet members and army and navy leaders of the highest rank.

Navy had been defeated in 7 successive games before engaging Army, and the cadets were favoured by 28 points. What took place was typical of the season. Army led by 21–6 at the end of the half, and Blanchard and Davis had put on one of their characteristic performances, accounting for all three of their team's touchdowns with long runs and passes.

In the second half the whole complexion of the game changed and a fighting Navy team came within a few yards of registering one of the biggest upsets in football history. The Army line weakened and was outplayed by its opponents. Navy scored two touchdowns more but failed to tie the score, owing to its failure to kick the extra points, and trailed by 21–18. Then, in the last few minutes, the eleven from Annapolis, coached by Capt. Tom Hamilton, a brilliant war leader, marched 64 yd. to Army's 3-yd. mark.

The Philadelphia Municipal stadium was in a wild uproar of excitement. It was first down and three yd. to go, with a minute and a half of play remaining. Nothing, it seemed, could save Army. The great West Point eleven was on the verge of defeat in the game that marked the end of the college careers for nine of its regulars, including Blanchard, Davis and Tucker.

But Navy failed to carry the ball across. Its first two rushes failed to gain an inch. It then suffered a five-yd. penalty for taking extra time out to make substitutions. On third down the carrier was stopped at the five-yd. line. Before another play could be run the game was over. A substitute had been sent out to stop the clock a few seconds before the end, but the officials did not see him and even had they stopped the clock there was not time enough left to put the ball in play again.

Army won and so completed its 3-year record without defeat, with 27 victories and 1 tie. But it had been outplayed so clearly for most of the second half that its prestige took a fall. Notre Dame, on the same day, was crushing Southern California, to end its season with a perfect record except for its tie with Army, and in the final nation-wide poll was voted the number one team.

Frank Leahy led the Fighting Irish to the top. Johnny

University of Georgia player driving for a touchdown against Tulsa university in 1946 at Houston, Texas. Georgia won, 20–6

Lujack, quarterback in the second half of the 1943 season after Bertelli joined the marines, was also back, to give the team brilliant direction and passing.

Georgia and U.C.L.A. were the only other major elevens, besides Army and Notre Dame, that went through the season without defeat, winning all of their games to rank third and fourth. After them came Illinois, Big Nine champion for the first time after 1928; Michigan, Tennessee, Louisiana State and Rice. Yale had its strongest team in years, though beaten once and tied once.

Alabama, rated the best in the country by many at the start of the season, lost four games. Texas was fancied to have the finest squad in its history but was toppled by Rice and again by Texas Christian to ruin the farewell season of its retiring coach, Dana X. Bible. One of the most surprising decisions was the defeat of Pennsylvania by Princeton.

An interesting development of 1946 was the agreement made between the Western and Pacific Coast conferences to meet in the Rose bowl for three years and possibly longer. Illinois was named by the Big Nine for the 1947 game at Pasadena and U.C.L.A. was selected as the host eleven after defeating Southern California. Georgia and North Carolina, champions of the Southeastern and Southern conferences, were picked for the Sugar bowl.

The Professionals.—Professional football, which had struggled for years to keep its head above water, found the road to prosperity in the middle '30s and from there on it won a larger and larger following. The adoption of a draft system in 1936 was a big step towards solvency, helping to strengthen the weaker clubs and make for more interest throughout the National Football league. The policy of abstaining from signing college players to contracts until their class had graduated also was an important step in the right direction, winning respect for the league's business practices and breaking down some of the opposition to professional football in the colleges.

The value of franchises increased and by 1940 the mem-

bership fee had increased to \$50,000. In 1941, professional football took another important step in winning public confidence. It engaged Elmer Layden, head football coach at Notre Dame, to serve as commissioner and supervise the conduct of its affairs, as Judge Kenesaw Mountain Landis and then Sen. Albert B. Chandler watched over organized baseball.

The biggest name players in college football were attracted into the professional ranks through the payment of salaries that would have been thought fabulous in the early days. Byron "Whizzer" White was paid \$15,000 for a single season of 4 months. Sid Luckman, Sammy Baugh, Bill Dudley, Steve Van Buren, Norman Standlee, Gil Bouley and others were signed up at fancy figures.

The biggest money-makers in the league were the Chicago Bears, the New York Giants, the Washington Redskins, who were transferred from Boston in 1937, and the Green Bay Packers. The rivalry between the Bears and the Packers in the Western division and between the Giants and the Redskins in the east was built up in the public mind to the importance of the traditional "classics" of college football.

As receipts mounted and a following was established, professional football attracted more and more big-name coaches from the colleges. These included Jock Sutherland, Jimmy Conzelman, Earl (Greasy) Neale, Adam Walsh, Gus Dorais, Hunk Anderson, Herb Kopf, Bud De Grott and Clark Shaughnessy.

During World War II, the teams were hard hit by the loss of their players to the service. They had a more difficult problem than did the colleges for the reason that there were no navy trainees to fill the gaps. Nevertheless, they managed to carry on, signing players who had seen their best years and were not called up in the draft. While the quality of the football deteriorated, the public did not lose its interest in the professional game, and big

crowds continued to come out. Transportation stringencies and gas rationing were not the problem they were for the colleges, for most of the league teams were in large centres of population and the parks could be reached by subway, buses and trolleys.

New Conference.—Professional football was so heavily patronized during the war that plans were made for organizing three new leagues. Only one of these materialized. A stadium in New York was a prerequisite to success, and the All-America conference was the new group that succeeded in putting a team into Gotham.

The All-America conference won out when it secured the Yankee stadium in New York. The owner of the Brooklyn Tigers of the National league, which had been merged with the Boston Yanks for the 1945 season, desired to put his team in the Yankee stadium in 1946. The ownership of the New York Giants refused to permit invasion of its territory by a second team in New York, whereupon the Brooklyn Tigers left the old league and came into the new loop under the name of the New York Yankees. Since the owner of the Tigers was part owner of the New York Yankees baseball club, he had no problem in finding a stadium for his football team.

James H. Crowley, former coach at Fordham and a member of the Four Horsemen team at Notre Dame with Layden, was named commissioner of the All-America conference. Layden retired to go into business and Bert Bell of Philadelphia succeeded him as commissioner of the National league.

The old and the new loop immediately began competition for the public's patronage, particularly in New York, Chicago and Los Angeles, where each had a team. The National league transferred its champion Cleveland Rams to Los Angeles to fight the All-America there. The new loop put a team in Cleveland and it proved to be the big money-maker of its group, attracting the biggest crowds in professional football.

The other teams in the All-America did not fare nearly so well. The Yankees drew good crowds, but their overhead was so high that little if any profit was expected to result from the first year's operations. The Giants' followers backed them in greater numbers than before and most of the teams in the old loop played to bigger crowds than their rivals. But all of the teams were feeling the burden of the heavy pay rolls. In the competition for players and with the new circuit raiding the ranks of the old, salaries were raised to attract or to hold the stars. It was a profitable year for the players.

Notable Pro Teams.—Taking the seasons chronologically, 1937 was the best year the National league had known in its history. Sammy Baugh, the greatest passer developed in the southwest, led the Redskins to the championship in their first year in Washington. They defeated the Giants to win the Eastern title and then won from the Bears in the East-West play-off.

In 1938, the largest professional crowd since Red Grange's debut in New York in 1925 saw the Giants defeat the Redskins for the Eastern championship. In the playoff they won from the Green Bay Packers. The following year, Green Bay turned the tables on New York to win the championship.

In 1940, one of the most celebrated games in professional history took place. The Chicago Bears, using their new T formation and with Sid Luckman at quarterback, massacred the Redskins by 73-0 to win the championship. That year Davy O'Brien, playing with the Philadelphia Eagles, set a record with 33 completed passes against the Redskins. Sutherland made his bow as the coach of the Brooklyn

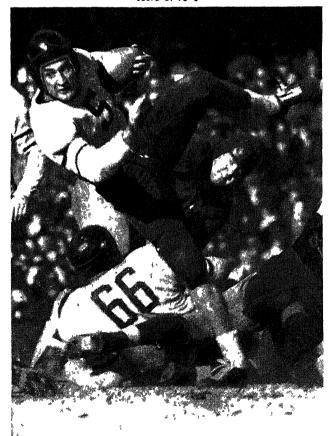

Dodgers and 55,000 saw them defeat the Giants.

The following year the Bears, now the scourge of professional football, defeated the Giants in the play-off, 37–9. In 1942 the great Bears, winners of 18 games in succession, crashed in defeat. The Redskins toppled them by 14–6, Baugh's brilliant passing and the strong Washington line proving too much for the Chicago team.

In 1943 the Cleveland Rams dropped out of competition as the owners went into service, along with many of the players. It was a year of scrambled results, with most of the teams weakened by losses, but attendance was up 36%. Luckman and Baugh and Don Hutson, Green Bay's great pass-catching end, were the big attractions. The Bears regained the championship by defeating the Redskins, 41–21. Luckman, preparatory to going into the merchant marine, set a play-off record by throwing five touchdown passes.

Weakened by the departure of their stars into the armed forces, the Bears yielded supremacy to the Packers in 1944. The Giants were the surprise of the east under coach Steve Owen but were beaten by the Packers in the play-off. Attendance marks were broken in 1945, the best year on record for the Giants. The Redskins played to capacity crowds regularly at home, and in the play-off at Cleveland between the Rams and the Redskins, a new mark for gross receipts was set. The Rams, coached by Adam Walsh and with a new star in Bob Waterfield, from U.C.L.A., won the championship by 15–14.

Chicago Bears' back, George McAfee, evading tacklers for a 7-yd. gain during the game for the national professional football title in which the Bears beat the Washington Redskins by the sensational score of 73-0

San Francisco halfback, Don Durban, stiff-arming opposition for a 6-yd. gain against the Chicago Rockets, Sept. 29, 1946. The Forty-Niners took second place in the western division of the All-America conference as the 8-club league ended its first season

In 1946, the National league enjoyed the same record prosperity that the college game did. The All-America conference did not fare so well, with the exception of the Cleveland Browns, who were coached by Paul Brown, formerly of Ohio State before going into the navy.

The Bears won the honours in the Western division of the National league and the Giants came out on top in the east. In the championship play-off at New York the Bears defeated the Giants 24–14 in a contest marked by disclosure of an attempt to persuade certain Giants to "throw" the game. In the All-America conference the New York Yankees won in the east and the Cleveland Browns ran away with the race in the west. In the play-off for the league championship, the Browns won, 14–9.

Outstanding professional players during the ten-year period included Don Hutson, Sammy Baugh, Sid Luckman, Mel Hein, Bill Osmanski, Bill Dudley, Norman Standlee, Andy Farkas, Danny Fortmann, Cecil Isbell, Ward Cuff, Jack Manders, Dutch Clark, Ed Danowski, Parker Hall, Ken Strong, Clyde Turner, Ed Stydahar, Cliff Battles, Clark Hinkle, Ed Widseth, Ace Parker, Beattie Feathers, Davy O'Brien, Tuffy Leemans, Dick Farman, Len Yonce, Eddie Rucinski, Riley Matheson, Bruiser Kinard, Whizzer White, Turk Edwards, George McAfee, Perry Schwartz, Wee Willie Wilkin, Bernie Masterson, Gary Famiglietti, Lee Artoe, Al Blozis, Tony Canadeo, Joe Aguirre, Al Wis-

tert, Ralph Kercheval, Glenn Presnell, Arnie Herber, George Musso, Gaynell Tinsley, Frank Sinkwich, Steve Van Buren, Bob Waterfield, Bill Paschal, Glenn Dobbs, Paul Governali, Angelo Bertelli.

Canadian Football.—Football in Canada, similar to the game played in the United States but not permitting downfield blocking, was increasing in popularity prior to the outbreak of World War II. The sport carried on during the war years, under restrictions, and there were many service teams.

The Toronto Argonauts and the Winnipeg Blue Bombers were the outstanding teams prior to 1940. The Argonauts won the Grey cup and the dominion championship in 1937, when they defeated the Bombers on Selkirk's field goal. The following year, in the most thrilling football spectacle seen in the dominion up to that time, the Argonauts repeated their victory for the title. Led by the brilliant running of Buster Storey, they defeated the Bombers, 30–7. Winnipeg and the Ottawa Rough Riders came through to the East-West play-off in 1939. Fritz Hanson, a shifty runner of unusual cleverness, and a strong line brought the Bombers out on top by the close score of 8–7. The blocking and tackling in this game were called the best seen in the east.

In 1940 intercollegiate play was abandoned owing to the war, but the game continued to go on. Because of the failure of the Western representatives to conform to the rule of the Canadian Rugby union regarding the use of interference, the East-West play-off was not held. The

Ottawa Rough Riders defeated Toronto Balmy Beach to win the C.R.U. championship.

In 1941, with intercollegiate football still under restrictions, the game continued to have a large following. The East-West match for the Grey cup was resumed. A change in rules permitted linemen to block five yd. ahead of the line of scrimmage and backs one yd. ahead, as compared with three yd. for linemen and one yd. behind the line for backs under the old rule. The rule permitting forward passing from any point behind the line, in use in western Canada, was accepted by the Canadian Rugby union. The Winnipeg Blue Bombers defeated the Ottawa Rough Riders, 18–16, before 20,000 at Toronto for the national championship.

In 1942, 1943 and 1944 football had a decided military tinge in the dominion. The royal Canadian air force furnished most of the personnel for the best teams. In 1942 the Toronto R.C.A.F. Hurricanes defeated the Winnipeg R.C.A.F. Bombers, 8 to 5, for the Grey cup and the championship. In 1943 all branches of the service had teams. The Hamilton Flying Wildcats defeated the Winnipeg R.C.A.F. Bombers, 23–14, for the championship. Joe Krol was the star of the Wildcats, who had nine or ten air force men on their side.

It was not possible to hold the East-West play-off in 1944 because of war conditions. Two eastern teams met for the Grey cup. The Montreal Navy defeated the Hamilton Wildcats, 7–6. It was the first time Quebec had won the dominion title since 1931. In 1945 football returned to nearly the level of prewar days, and the East-West play-off was resumed. The Toronto Argonauts defeated the Winnipeg Blue Bombers for the Grey cup by the score of 35–0.

In 1946, the Argonauts again won the cup, defeating Winnipeg, 28-6. (A. DA.)

Stevens, How to Watch a Football Game (1937); U.S. Office of Naval Operations, Football (issued by Aviation Training div., 1943); Who's Who in Major League Football (1935 et seq.).

Great Britain.—In 1937 England won the international Rugby union championship; both the home matches were won by a single point, and the only really clear-cut victory was at Edinburgh, where England beat Scotland by two tries to a penalty goal. This was the first time England had ever won at Murrayfield, although Scotland had been playing there since 1925. The South African athlete, H. G. Owen Smith, captained England from the fullback position. H. S. Sever scored a sensational try that helped to beat Ireland at Twickenham. W. R. Logan captained Scotland, E. C. Davey Wales, and G. L. Morgan Ireland.

The year 1938 saw a marked improvement in the standard of football, and Scotland won the championship. With R. Wilson Shaw as captain, the side opened with an extremely lucky win against Wales at Murrayfield, the scores being a goal and a penalty goal to two tries. They won at home against Ireland by 23 points to 14, and beat England at Twickenham by the unusual score of 2 penalty goals and 5 tries (21 points) to a dropped goal, 3 penalty goals and 1 try (16 points). Clifford Jones was now captain of Wales, Peter Cranmer of England, and Morgan again of Ireland.

The standard of Rugby union football in 1939 again fell

back; England, Wales and Ireland divided the honours, and Scotland lost every match. In 1938, a British side, under the captaincy of Sam Walker (Ireland), had toured South Africa where they won only one of the three tests. An Australian side landed in England at the end of Aug. 1939 for a tour in the four countries, only to be dispersed when World War II broke out. In the three seasons before the war Cambridge had won two of the three university matches; the royal navy had won the interservices tournament twice; the county championship was won by Gloucestershire, Lancashire and Warwickshire (for the first time) successively; St. Mary's hospital won the hospital cup every year.

World War II took heavy toll of Rugby union men, among them H. Rew (England), W. G. E. Luddington (England), C. F. Halloran (Ireland), D. E. Teden (England), E. W. de Vere Hunt (Ireland), J. G. S. Forrest (Scotland), D. St. Clair Ford (Scotland), J. R. Evans (Wales) and T. F. Dorwood (Scotland). At home the services, including the civil defense, kept the game going, and all over the country some rugby football, even in the London area and at the universities and hospitals, could be seen. In the first season after the war, interest was added to the game by the tour of a New Zealand side, the "Kiwis." They played excellent football and were beaten only three times. The countries all played one another again, most of them twice to make up for lost time; but there was no championship concerned, and no caps were given. Scotland was easily the best side, and also had the honour of beating the Kiwis. Cambridge won the university match in 1945 and Oxford in 1946. St. Mary's continued to win the hospital cup, and the army won the interservices tournament. Among the prewar internationals in the game again were J. Heaton (England), R. H. Guest (England), J. R. S. Innes (Scotland), C. J. Murphy (Ireland), F. G. Moran (Ireland), Hayden Tanner (Wales) and L. Manfield (Wales).

Rugby League Football.—The league celebrated its jubilee in 1945, for it was in 1895 that the "Northern union" (as it was first called) broke away from the Rugby union on the question of payment for "broken time." An Australian side visited England in 1937, and lost the test series to England, which won two of the three matches. The leading club during the three prewar years was Salford. In the Club championships they won the Rugby league cup in 1937 and 1939, and in the Challenge cup competition they won the cup in 1939 and were the losing finalists to Halifax in 1939. The whole side was well balanced and played excellent football, though they failed badly on their second visit to Wembley in 1939, when Halifax won by 20 points to 3.

Many clubs closed down during World War II, but the Challenge cup competition continued. Leeds won it in 1941 and 1942, Dewsbury in 1943, Bradford Northern narrowly against Wigan in 1944, and Huddersfield equally narrowly against Bradford Northern in 1945. All this time, in services football (which formed the bulk of the national football), Rugby league players and Rugby union players all played together.

After the 1945-46 season had ended, with Wigan winning the Rugby league championship and Wakefield Trinity beating Wigan in the Challenge cup competition with its final at Wembley by 13 points to 12 (the finest of all the finals seen at Wembley), a representative side, captained by A. J. Risman, went out to Australia. It broke all financial records, and the takings at the first test (at Sydney) were more than £10,000. This particular test was

388 drawn, but both the others were won fairly easily by England.

Association Football.—In 1937, Sunderland won the Football Association cup for the first time, and by the end of that year W. R. Dean, the old Everton centre-forward, had scored 375 goals in league football, beating Steve Bloomer's 1914 record of 352. Wales won the international championship, winning all three matches. The England v. Scotland game was played at Glasgow, and the visitors won it brilliantly by 3–1. At the end of this season the Arsenal broke all records for a transfer fee by paying Wolverhampton Wanderers £14,000 for the services of Bryn Jones; fees of £10,000 for a player were not uncommon at that time. Celtic won the Scottish cup, Belfast Celtic the Irish cup and Crewe Alexandra the Welsh cup.

In 1938, Preston North End won the cup, after having been beaten in the final the year before by Sunderland. In Scotland, for the first time in the history of the competition, the cup was won by a second division side (East Fife). To mark the jubilee (1888-1938) of the Football league, a banquet was held in London, the guests including the duke of Gloucester and Lord Derby. Some of the outstanding players at this time were S. Matthews, the Stoke City outside-right, S. Cullis, the Wolverhampton centre-half, and A. Massie (Heart of Midlothian). In 1938 the game drew in bigger crowds than ever. Portsmouth won the cup for the first time, beating Wolverhampton Wanderers; Clyde, the Scottish cup; and Bishop Auckland, the amateur cup. Interest in Association football had become widespread, and international matches were played against Norway, Italy, Yugoslavia, Rumania, France, Hungary, Switzerland, Poland and Germany.

Most of the competitions were carried on during World War II in modified forms. The outstanding event of 1945 was the visit of the Russian team, Moscow Dynamo, which attracted tremendous crowds at Chelsea, Cardiff, Glasgow and Highbury (against the Arsenal). They won two matches and drew the other two, impressing everybody by their attacking skill and physical fitness.

The year 1946 began with a great tragedy: in a cup-tie at Bolton (against Stoke City) one of the stands collapsed; 33 spectators were killed and more than 500 others injured. Later in the year, Derby county won the cup with two great players in P. Doherty and H. Carter. Scotland was the best international side, and France beat England in Paris by two goals to one. Visiting teams from Sweden and Denmark in the autumn showed impressive form against English professional clubs. Never were there such crowds at matches, and the players began to agitate for greater remuneration for their services, a strike being threatened more than once.

Foreign Investments in the United States

By 1937 the value of foreign investments in the United States had already begun to reflect the uneasiness with which holders of these investments viewed the increasing military growth of the fascist powers. The movement of foreign funds to and from the United States after 1929 (mainly from the United States) had been associated, until about 1935, with factors primarily regarded as economic, e.g., the depression and the coincidental devaluation of currencies and the need by foreigners for dollars with which to meet obligations in the United States. When Benito Mussolini sent his armies across the Mediterranean to seize Ethiopian territory in 1985, investors and others began to fear the consequences of an embroilment of nations. An influx of funds into the United States which lasted through the next decade ensued, precipitated by this event and by later evidence of political instability.

The other factors making for movements of capital were, of course, still present and powerful, but the desire for safety and mobility of principal agitated a tremendous movement of funds into the United States that would probably not have occurred if nazi power politics had not been unleashed. One financial measure of the impact of axis activities in the middle thirties-the Ethiopian invasion, the rearming of Germany, the Japanese invasion of China and the fascist-sponsored rebellion in Spain-was an unusually large inflow of foreign funds into the United States seeking haven, during the three-year period 1935 through 1937. This totalled \$1,168,500,000 of liquid (shortterm) funds; in addition, \$1,162,000,000 of U.S. securities were purchased. The movement contributed to raising the value of foreign investments in the United States to about \$9,500,000,000 at the end of 1937.

From 1937 to the beginning of World War II the value of foreign-owned investments in the United States continued to increase. With each new act of axis aggression, a wave of foreign capital reached the United States. However, the movements were sometimes obscured by the balance-of-payments position of that country which required large payments by the rest of the world and by political and economic factors unrelated to axis activities. For example, German-stimulated tension over the Sudeten areas of Czechoslovakia which had grown intense during late July, 1938, increased during September; during the week of Sept. 14, the week of the Nuernberg congress of the nazi party, banks in the United States reported an increase of \$145,000,000 in foreign accounts with them. In the following week the inflow was \$121,000,000.

On the other hand, a similar inflow was not recorded in March of the same year, when Germany invaded and annexed Austria. The movement of funds to the United States that undoubtedly took place at that time was overshadowed in the recorded statistics of capital movements by the purchase during the first six months of 1938 by the rest of the world, of about \$630,000,000 more of merchandise from the United States than the United States purchased from other countries. To pay this sum, foreigners drew on their short-term funds in the United States. Thus their aggregate U.S. investments declined despite the movement of funds to that country from Europe.

However, in the recurring periods of crises that followed, large sums flowed to the United States; \$450,000,000 during the seven-week period beginning with the German invasion of Czechoslovakia in March 1939, and another \$270,000,000 during August of that year, when Germany created the Polish crisis. In addition, foreign governments

and foreign central banks placed \$534,000,000 of gold under the protective custody of the federal reserve banks in the United States during 1939 and an equal sum in the two preceding years. In a technical sense this gold was not regarded as an investment in the latter country, although such gold was readily convertible to investments.

Liquidation of British Assets.—At the outbreak of World War II the combined investments (long-term and shortterm) in the United States of the three principal axis partners was about \$500,000,000. British, Canadian and French investments in the same country were about eight times as large, and five-eighths of these were British. Unprepared as they were for the type of war that was to follow, the countries that opposed the axis in 1939 began to mobilize their resources in foreign countries, particularly in the United States. They hoped to liquidate those at high prices and use the proceeds for the purchase of foreign war matériel and food. On Aug. 27, 1939, the British government banned the sale of certain foreign securities, including those payable in dollars, and ordered all investors to report their holdings to the Bank of England. The French government also required investors to report their holdings, and both governments instituted control over all exchange operations. In the same month Canada and other parts of the British empire adopted similar measures.

During World War I the British had permitted largescale liquidations of U.S. securities by investors, and as a consequence these securities were liquidated at low values. During World War II the disposal of British assets was more carefully planned. In order to preserve the flow of income from overseas assets as long as possible, the British disposed of the bulk of their holdings of gold and shortterm balances and then began to liquidate their holdings of readily marketable securities, intending to retain the most profitable for the last.

In five vesting orders between Feb. 1940 and April 1941, the British government obtained its nationals' holdings of 484 issues of U.S. securities. The ownership of these stocks and bonds had not involved any control in the companies which had issued them. The British treasury proceeded to sell these in New York through underwriting syndicates which offered blocks of issues listed on the New York stock exchange "off the market" after the close of regular trading hours on that exchange. In this manner large volumes of securities were sold at prevailing prices without depressing the market. Blocks small enough to be sold on the floor of the exchange without any appreciable effect on prices were sold in that manner. From the beginning of the war until Aug. 1941 the value of these (and other U.S.) securities sold, mainly in this fashion, totalled \$623,000,000.

In March 1941, the British government took its first step toward disposing of its choice foreign investments—companies controlled in England—when it arranged for the sale of the American Viscose corporation, at a substantial loss. The British received about \$55,000,000 for a company whose net worth probably exceeded \$100,000,000. To avoid a similar experience, the Brown and Williamson Tobacco company, also British-controlled, borrowed funds from the Reconstruction Finance corporation in the United States and used most of the proceeds to pay off indebtedness to its British parent company and to purchase its own preferred shares and securities of affiliated companies from its parent. In this manner, the British parent realized \$25,000,000, while still retaining control of the U.S. company.

Passage of the American Lend-Lease act on March 11, 1941, relieved the British government of the necessity for hurried liquidation of assets in the United States, although

there was a pressing need for funds to meet commitments made to that date and to purchase supplies in third countries. This burden was eased when the Reconstruction Finance corporation announced in July 1941 that it had granted a loan of up to \$425,000,000 to the English, with U.S. securities as collateral. The collateral, valued roughly at \$700,000,000, was comprised of a portion of the vested securities referred to above, and to securities of Britishcontrolled companies in the United States which the British government had borrowed from their owners. Indicative of the extent to which the British government had been using their foreign assets was the fact that, in addition to goods purchased and shipped from the United States, the United Kingdom had made advance payments on orders for future delivery and provided capital assistance to U.S. producers to the extent of about \$850,000,-000 by mid-June 1941.

Control of Foreign Funds.—When national socialism came to power in Germany, fanatic yet competent men gained the power to develop international finance as a subtle and secret weapon with which to weaken intended national victims before the involvement of armed forces. The United States treasury department countered this aggressive use of financial policy through domestic financial control, including control over foreign funds in the United States; first for their protection (April 10, 1940 to June 14, 1941), later for national defense (June 14 to Dec. 8, 1941), thereafter as part of economic warfare.

Over a period of years an international faith had developed in the integrity of the United States government and a belief that it would protect alien property lawfully within its jurisdiction. The country therefore had become a storehouse of treasure for the world. Full use by the axis of its credits within the United States would have made a substantial contribution to the cause of the invaders. This would have placed the United States in the position of being the financial medium through which goods and services might be supplied the axis powers, notwithstanding the provisions of the U.S. Neutrality act of 1939, which forbade direct trading with belligerents.

Axis control of assets in the United States became a subject of official U.S. concern with the outbreak of World War II. The invasion of Norway and Denmark provoked the immediate freezing of their funds in the U.S. The issuance of a series of exécutive orders in 1940 and 1941 immobilizing the assets in the United States of the axis countries and of those countries overrun by the axis (and the granting of licences to friendly and neutral countries to engage in financial transactions in the U.S.) served to lessen greatly the turnover of certain foreign capital in the United States. Initially, freezing the funds of the victims of aggression was in effect formal notice to the aggressors that any attempt to secure control of the dollar assets of invaded countries or of their nationals by duress would be blocked by official action. Subsequently, the freezing of axis funds in June and July 1941 and the requirement that all foreign assets in the United States be registered as of June 1, 1940, and June 14, 1941, laid the basis for an effective machinery with which to control foreign funds.

The situation at that time required a comprehensive survey to determine the value of all foreign property existing in the United States. Executive order 8389 required the value of property and the identity of persons holding property to be reported to the treasury department. Almost 600,000 reports filed by individuals and institutions in the United States included information on securi-

ties, bank accounts, safe deposit boxes and an innumerable variety of other assets (see Table I).

Prior to the attack on the United States on Dec. 7, 1941, Japan, Germany and Italy had sharply reduced their investments in that country. During this period several agencies of the United States government had certain axis properties under surveillance. The management of a number of these properties was subsequently placed in the hands of persons acceptable to the treasury department, and a number of companies whose products or services were not essential were liquidated. The identification of other funds or property controlled by nationals of aggressor states directly or through custodial or nominee ownership made possible by the registration of June 14, 1941, and by official records facilitated the ousting of axis control from a number of important U.S. enterprises producing materials vital to the prosecution of the war.

The administration of controls over foreign property in the United States from 1940 through 1945 was in general focused on axis and axis-controlled properties and the property of neutrals whose relations to the axis were suspect. Legislation and executive orders gave the treasury department and the alien property custodian primary responsibility for the control of these properties. The treasury's general jurisdiction until June 1945 covered: (1) Dollar balances, bullion and securities of governments or nationals, except those of businesses under the jurisdiction of the alien property custodian; (2) all property of the occupied countries and their nationals except those particular business enterprises where the alien property custodian determined that it was in the national interest that he assume control; and (3) all transactions or business dealings with countries blocked under freezing orders, including the control of trade and commercial communications with the axis and axis-controlled countries.

The alien property custodian, in general, had jurisdiction of the following during this period: (1) Axis-owned or axis-controlled business enterprises, whether controlled directly, through neutrals or by virtue of the occupation of invaded countries; this jurisdiction extended to the dollar balances and other assets of such businesses; (2) All other types of axis property, except dollar balances, bullion and securities; these included estates, trusts, properties in receivership proceedings, real estate, mortgages, personal property, etc.; (3) All foreign-owned patents, copyrights, trademarks and ships; and (4) Interests in other business enterprises of all foreign nationals when the custodian certified to the secretary of the treasury that it was in the national interest for him to assume control.

The Office of Alien Property Custodian and the treasury at that time strove toward three main objectives. First of these objectives was the complete severance of all financial and commercial intercourse, trade and communication, direct and indirect, between the United States and other American republics on the one hand, and axis or axisdominated countries on the other. The second was control over potentially dangerous use of axis property:

- 1. Use of assets to finance propaganda, espionage and sabotage in the United States or in other United Nations countries.
- 2. Acquisition of stocks of strategic materials in United Nations and neutral countries even though such materials were of no direct use to the enemy, but were diverted from the war effort of the United States.
- 3. Management of plant and equipment either through failure to convert to wartime production or through less than full utilization with the specific objective of retarding maximum wartime production.
- 4. Mismanagement of properties and goods by permitting them to deteriorate.
- 5. Limitations on the use of important techniques and processes through the control of patents, patent applications and copyrights.

^{*}Excluding gold held under earmark for foreign account by the Federal Reserve Bank of New York, which amounted to \$1,916,000,000.

[†]Control was determined on the basis of the ownership of 25% or more of the voting stock of corporations and analogous interests in partnerships and other organizations, ‡Less than \$50,000.

[§]Included in the totals.

^{||}Taxes, amounting to about \$37,850,000, collected under section 503 of the Sugar Act of 1937, to be made available for public relief and civilian defense in the Philippine Islands, are not included in this figure.

Note.—The figures are rounded and will not necessarily add to the totals.

Source: Census of Foreign-Owned Assets in the United States, U.S. Treasury Department, 1945.

The third objective was to promote the war effort of the United States by making available axis-controlled productive enterprises.

The first of these objectives was aided by the treasury's procedure of licensing foreign transactions in the United States, a system of export control, and the publication of a list of persons and enterprises in Latin America and in the eastern hemisphere who were friendly to the axis. This list, known as "The Proclaimed List of Certain Blocked Nationals," contained more than 14,500 names as of Jan. 1945, and served the other American republics in controlling anti-United Nations activities.

The treasury operated through its foreign funds control division, which during World War II placed the following areas under its jurisdiction and prohibited all transactions involving them except as authorized by the secretary of the treasury: continental Europe (except Turkey), Japan, Japanese-occupied areas and China. This type of control was extended to individuals and firms in the American republics and elsewhere who co-operated with the axis. The program was essentially one of regulating the use and disposition of property in which a blocked country or national had an interest. This control was exercised through the prohibition of all transactions involving such property and the subsequent issuance of licences authorizing specific transactions and, in certain instances, broad groups of transactions. The system of control was applied to business enterprises as well as to liquid assets. Freezing controls affected about \$6,000,000,-000 of the \$12,700,000,000 of foreign-owned assets.

To obtain their objectives the treasury and the alien property custodian also took control over a number of axis properties in the United States. Both agencies were reported to have liquidated more than 500 enterprises by May 1943 and were in the process of liquidating others. It had previously been determined that these were nonessential to the war effort and that the national interest would best be served by making their productive assets and labour available to other producers. The shares of a number of concerns important to U.S. war production were vested (the outright transfer of title to property from the foreign owner to the custodian). The custodian, where necessary, replaced the management and other personnel by loyal, competent persons.

The alien property custodian issued more than 5,000 vesting orders between March 1942 and July 1945 in pursuance of the objective of control over productive resources formerly controlled by the axis and their exploitation to the full as part of the war effort. Most of the important axis properties in the United States were vested during 1942 and the first half of 1943, so that the number of large properties vested after July 1943 was relatively small in contrast with the earlier period.

As indicated in the custodian's annual report for the year ending June 1945, the assets of vested enterprises, mainly engaged in chemical, financial and wholesale activities, totalled \$371,400,000. The foreign equity in these enterprises ranged from 100% control in some 55% of the 408 enterprises vested to minority interests in only 14%, and aggregated somewhat in excess of \$151,000,000. About half of the enterprises were German and over 40% were Japanese. Geographically the properties were concentrated in the state of New York (mainly German and Italian), while many Japanese properties were located in California. Other property vested to that date also involved proportionately large German industrial interests.

Of the more than 46,000 patents and patent applications vested, almost 30,000 were German-owned. German-owned copyrights, concentrated in scientific and technical works, were a relatively small part of all vested copyrights. The bulk of known French and Italian copyrights were in music

Since several of the governments in exile had (prior to the liberation of their territories) taken steps to control the foreign property of their nationals, the custodian found it desirable to consult with representatives of these governments before taking steps affecting the property of their nationals. Close co-operation remained necessary between the United States and neutral countries on the problem of looted securities. The axis probably had in its control hundreds of million dollars of securities representing investments in the United States which it had seized from foreigners. To prevent axis governments and leaders and their collaborators from retaining their loot under neutral protection, the United States government requested neutral governments in Oct. 1944 to institute controls designed to uncover such property concealed in neutral countries. After June 6, 1940, the importation of securities into the United States from any foreign country was prohibited except on condition that such securities or evidences thereof were immediately delivered for examination to a federal reserve bank or agent for the United States government. The federal reserve banks were to hold these securities until it was determined whether any of the following nations or their nationals had an interest in the securities or evidences thereof: continental Europe, China, Japan, Thailand (Siam), Hong Kong. (The effective dates of the application of the prohibition to individual countries varied from June 1940 to June 1941.) In view of the rigid controls on international movement of funds and securities already existing in Great Britain, Canada, Newfoundland and Bermuda, securities coming from these countries were exempted from the prohibition. Customs officers and postal employees were privileged to inspect articles which they thought might contain securities. Unless the axis was deprived of this loot it seemed desirable to continue a system of control, particularly since most of the obligations were believed to be bearer bonds and required no evidences of ownership or acquisition other than physical possession in order to be sold or be presented for the payment of interest-hence, the need for close working arrangements with neutrals and others.

In June 1945 President Harry S. Truman, in an executive order, authorized the alien property custodian to seize German and Japanese cash, gold and securities in the United States. These assets had been frozen during the war by the treasury's foreign funds control division and, according to press reports, amounted to about \$220,-000,000. The action was interpreted as a step toward the ultimate seizure and distribution of the assets to claimants against both countries. However, the disposition of these funds and the proceeds of the sales by the custodian of axis-controlled enterprises in the United States remained a matter for congressional decision. It was generally recognized that the potential funds available from these sources-roughly \$220,000,000 of short-term assets, gold and securities, and \$235,000,000 of vested properties-would fall far short of meeting merely the claims resulting from damage to U.S. properties in both countries and the losses to U.S. investors in German and Japanese bonds.

Up to Nov. 1945 the custodian had offered for public sale the government's interest in 19 of the 408 business enterprises seized by his office. Among those so offered during 1945 were two former meeting places of the Ger-

man-American bund; one was the well-known Camp Nordland in Andover township, Sussex county, New Jersey. The custodian also took further steps to destroy the corporate structure formerly controlled by the giant German chemical cartel, I. G. Farbenindustrie. The cartel's indirect holdings of the Class B common stock of the Winthrop Chemical company of Delaware, an important manufacturer of chemical products, were sold to the Sterling Drug, Inc., of Delaware, under terms that virtually prevented its return to German control after the war through "fronts," "cloaks" or other devices.

At the time of the transaction the United States attorney general pointed out that after World War I this same property had been sold by the alien property custodian to United States citizens but that it had ultimately found its way back to I. G. Farben interests. To prevent the recurrence of this experience, he had recommended that restrictions be placed on the transfer of title or control of the shares.

The custodian also noted that prior to World War II, axis concealment of the true ownership of some U.S. firms had been exceedingly skilful. Indeed, in one case, it was so successful that the U.S. managers of the American Potash and Chemical corporation apparently had not known that German concerns were the beneficial owners of the company.

The company was an important producer of varieties of potash, chloride, borax and other chemicals used in the manufacture of many military explosives, armour plate, ordnance articles and instrument glass used in bomb-sights and gunnery fire-control devices. In his second report, for the fiscal year ending June 1944 (released in 1945), the custodian noted the following among the contributions to the war effort by firms he was liquidating:

"Among the assets of business enterprises then in liquidation the alien property custodian had discovered a variety of pieces of property which proved to be of direct assistance in the prosecution of the war. The following were examples:

- 1. A scale model of the Fiat plant at Turin, Italy, was found among the records of the Fiat Societa Anomina and turned over to the United States army intelligence service. It was understood that this model was used in plans for bombing the plant, which manufactured aeroplanes for the axis.
- 2. Three large-scale maps showing in minute detail the cities of Osaka, Nagoya and Yokohama, Japan, were found among the property of Japan Products Co., Inc., and turned over to the United States army intelligence service.
- 3. The files of the U.S. branch of the huge Japanese firm of Mitsui & Co., Ltd., contained a large number of books, maps, plans, specifications of machinery, etc. This material was searched by the proper authorities and yielded valuable information.
- 4. The books and pamphlets found in the stock of Gosha-do, a Japanese book store, proved of great value to the war effort. Different items from this collection were used by the Office of War Information, the army, the navy and the Office of Strategic Services.
- 5. Two Japanese typewriters were among the assets of the Pacific Trading company. These typewriters were handed over to the United States army intelligence service and on the day following their receipt they were flown to General Douglas MacArthur's headquarters where they proved most useful."

The treasury department took two important steps during the first ten months of 1945 designed to free friendly funds from its control. The first lifted all liberated areas out of the category of enemy territory and the second, relating solely to France, suggested a pattern that might be applied to the assets of nations of other overrun allied countries. These involved the lifting of the treasury's import and export controls over payments to and from blocked countries, and, in the case of France, released French assets (mainly banking balances, bullion and securities) in the United States from the treasury's jurisdiction. The complete release of the latter, however, was dependent upon certification by the French government that such assets were in fact French-owned, although the United States reserved the right to join in the clearance of individual accounts. The certification requirement provided the French government with an opportunity to check the beneficial ownership of all property and to prevent the release of property which was held in French names but was actually axis-owned. At the time of the announcement the French government expressed the conviction that the treasury's freezing controls had placed a disadvantage on the axis by preventing it from looting these assets while at the same time preserving them for the French people. A defrosting procedure similar to the one relating to French assets was applied to Belgian assets in Nov. 1945.

On Dec. 7, 1945, the treasury announced a sweeping relaxation of freezing control for all countries except Portugal, Spain, Sweden, Switzerland, Liechtenstein, Tangier, Germany and Japan. The people of the United States were permitted by general licence to engage as freely in financial and commercial transactions with persons in the newly unblocked countries as with persons in Great Britain, Canada and other countries of the western hemisphere. However, the then existing blocked accounts of persons within the licensed countries were not freed by this action.

It was further stated that the neutral countries mentioned above would not be accorded the privileges made available to other countries until they had taken effective action to search out, immobilize and control all enemy assets within their jurisdiction, and until a satisfactory solution had been reached concerning the disposition of those axis assets.

Controls over blocked accounts within the generally licensed areas were maintained to insure that camouflaged axis assets were not released.

By June 14, 1946, in addition to the assets of France and Belgium, the assets of Norway, Finland, the Netherlands, Czechoslovakia, Luxembourg and Denmark, in the United States had been unfrozen under a certification procedure similar to that in effect for the aforementioned two countries.

Sources: Data in Census of Foreign-owned Assets in the United States, U.S. treasury department, 1946, adjusted for capital movements figures appearing in the Treasury Bulletin, and estimates of the department of commerce for 1937.

Change in Value, 1937–1946.—The value of foreign investments in the United States increased from \$9,480,000,000 at the end of 1937 to \$15,500,000,000 at the close of 1946, as shown in Table II. The rise, which was most pronounced in short-term investments, reflected increases in the value of the U.S. holdings of most countries. An increase of about 70% in common share prices during the period more than offset liquidations of these securities valued at hundreds of millions of dollars. Forests

In the years just before World War II, some significant advances occurred in forest conservation and restoration in the United States. All accomplishments, however, failed to reverse the downward trend of the nation's forest resource which had continued for more than a century. Heavy drain on the forests during the war years resulted in further deterioration of the timber stands. The United States forest service, the agency of the federal government charged with responsibility for promoting the conservation, protection and wise use of the nation's forests, reported in 1946 that the total volume of standing sawtimber in the United States had declined 9% after 1938.

The Civilian Conservation corps (q.v.), established in 1933 to help meet the problem of unemployed youth through public conservation work, was operating with more than 1,500 camps and 500,000 enrollees in 1937. In this program the department of labour was responsible for enrolment of men, the war department for maintenance and operation of the camps and several agencies, including the U.S. forest service, national park services, soil conservation service, Tennessee Valley authority and the state forestry departments, co-operated in supervision of work projects.

CCC work projects covered a wide field. Much of the work, however, was in the forests. During the nine years of its existence, the CCC planted more than 1,500,000,000 trees on denuded or fire-scarred forest lands; constructed thousands of miles of telephone lines, roads, trails and firebreaks and hundreds of lookout stations to facilitate control of fires; developed more than 3,600 camping and picnic grounds in national, state and community forests; thinned thousands of acres of crowded young timber stands and performed important service in combating forest insect and disease infestations. The CCC became the main line of defense against fire not only on all public forests but also on many privately owned forest lands.

By 1941, the U.S. defense program had greatly reduced the problem of unemployment, and many CCC enrollees and eligibles of draft age were going into the armed services. Congress therefore terminated the Civilian Conservation corps on June 30, 1942.

The national forest system administered by the U.S. forest service included 158 units aggregating 171,403,306 ac. as of June 30, 1937. By 1946, consolidations and boundary adjustments had reduced the number of national forest units to 152, but the total area had increased to 178,921,476 ac. The increase in national forest area resulted for the most part from purchases of land during the late 1930s, under authorization of the Weeks law of 1911. Land purchases were largely suspended during the war years. Some additions to the national forest area also occurred through land exchanges between the federal government and individual owners, and through donations. Much of the land acquired through purchase and exchange had been cut over and burned over, and the forest service faced a huge task of forest restoration on these depleted areas.

Timber sold from the national forests in 1937 amounted to about 1,250,000,000 bd.ft. Heavy demand during the war years increased annual timber sales to more than 3,000,000,000 bd.ft. In 1946 the total cut from the national forests under sales and exchanges was approximately 2,750,000,000 bd.ft. A program of access-road construction under way in 1946 to open up inaccessible stands of mature timber was expected to make possible a postwar increase in cut to or above the wartime figure. The forest service continued its policy of management of the national forests for a sustained yield of timber to insure permanent production and stability of dependent communities.

The number of visitors to the national forests for recreational purposes dropped from a piewar total of approximately 18,000,000 a year to 6,000,000 in 1944. With the cessation of gasoline rationing and other restrictions on travel, recreational use during 1946 was at rates exceeding the prewar total. Many of the national forest recreational facilities however, were in run-down condition because of lack of maintenance during the war years. With a special appropriation from congress, the forest service in 1946 began the restoration of recreation areas to safe and sanitary condition. Winter sports in the national forests increased greatly in popularity during the decade and accounted for an estimated 2,000,000 visits in 1946, more than double the figure ten years earlier.

With emergency funds allocated by President Franklin D. Roosevelt to the secretary of agriculture for planting protective strips of trees in the Plains region as a means of ameliorating drought conditions by giving protection from wind to soil and crops, the forest service in the fall of 1934 initiated a Plains Shelterbelt project. The first trees were planted in the spring of 1935, under a plan of leasing planting sites. Beginning in the spring of 1936, the work was set up as a co-operative undertaking with individual farmers. Administrative offices for the project, which was later designated the Prairie States Forestry project, were established at Lincoln, Neb., with state divisional offices in the capital cities of each of the states in which the project operated—North Dakota, South Dakota, Nebraska, Kansas, Oklahoma and Texas.

In the following seven years, 18,600 mi. of field shelter-belts were planted. More than 30,000 farmers participated in the program. Tree survival was remarkably high, and growth in most sections was rapid. Although the trees would not attain full height for many years, the beneficial effects of the tree belts in conserving soil moisture and protecting crops from wind damage began to be realized within a year or two after establishment.

On June 30, 1942, the shelterbelt planting program was

discontinued as a special project of the forest service, but co-operative aid to farmers in establishing shelterbelts was continued by the soil conservation service in that portion of the project area falling within state soil conservation districts in the Plains region.

The disastrous New England hurricane of 1938 damaged timber stands over thousands of acres. To aid landowners in salvaging the wind-thrown timber, the federal government set up a Northeastern Timber Salvage administration, administered by the forest service and financed by the Disaster Loan corporation. The forest service established log grades and prices to prevent disorganization of the timber market, set up more than 800 receiving sites, purchased and stored logs, sawed or contracted for sawing them into lumber and channelled the lumber into market outlets. At the close of the program in 1943, more than 660,000,000 bd.ft. of sawlogs and 35,000 cords of pulpwood had been salvaged. Thirteen thousand timber owners were aided

Products of the forests played an extremely important part in the conduct of the war. The U.S. army used a greater tonnage of wood than steel. The indispensability of wood was clearly demonstrated. In the early months of the war, wood was called upon to replace critical metals in many fields. Soon, however, wood itself became a critical material. War demands outstripped supply.

At the request of the War Production board, the forest service conducted a large-scale enterprise for the logging of Sitka spruce in Alaska to help meet urgent war needs for high-grade spruce lumber for aircraft construction. The logging was done by contractors. By the end of 1944, more than 38,000,000 bd.ft. of high-grade spruce logs were cut, assembled in huge rafts and towed 900 mi. to mills in the Puget sound area. In addition, some 46,000,000 bd.ft. of hemlock and lower-grade spruce were delivered to sawmills in Alaska for use of the armed forces there.

In 1949, the forest service was called upon to initiate a program to stimulate lagging production of lumber and other forest products required for war and essential civilian needs. A Timber Production War project was launched in states east of the Great Plains, with project foresters assigned to aid woodland owners and forest-products operators to meet acute problems of labour, equipment shortages, log supplies and other difficulties. The project foresters performed valuable service in bringing timber owners and operators together, helping operators keep up production and channelling products to essential war needs. By 1945, when the project was terminated, it had resulted in production of about 8,000,000,000 bd.ft. of forest products that probably would not have been produced otherwise. Much of the increased production was from the smaller mills and plants, many of which had previously shut down because of wartime difficulties.

Immediately after Pearl Harbor the federal and state forest services manned fire-lookout stations in the coastal areas, and for two and one-half years forest lookouts served as key stations in the army aircraft-warning system.

When Japanese conquests shut off foreign rubber supplies, congress, in the Emergency Rubber act of 1942, authorized a wartime project for domestic production of natural rubber. The forest service was assigned responsibility for the emergency rubber project. Major emphasis was given to planting guayule, a native rubber-bearing shrub which had been used for some years in Mexico as a source of commercial rubber. Nurseries were speedily established, acreage leased and planting started. Most of the work was concentrated in California, where some experimental work in guayule growing already had been

Ghostly remains of a giant Douglas fir after a great forest fire had raged for several weeks along the Oregon coast range in July 1945

done by the Intercontinental Rubber company.

Approximately 32,000 ac. were planted to guayule. The Intercontinental Rubber company's experimental process-

ing plant at Salinas, Calif., was enlarged and improved and a new plant was constructed at Bakersfield, Calif.

When the war ended and the project closed down, most of the planted shrub had not yet reached maturity. A total of 2,947,273 lb. of guayule rubber had been milled out, however, and sold to rubber companies during the life of the project. Several tons of rubber also were produced from wild guayule harvested in the Big Bend area of Texas. The project was terminated before it had gone far enough to determine the practicability of raising guayule as a peacetime commercial crop.

As a part of the emergency rubber project, the forest service also conducted some experimental work with *koksaghyz* (Russian dandelion) and various strains of goldenrod as rubber sources.

In 1942 the forest service undertook a survey of tropical timber resources in Central America and northern South America. Primary purpose of the study was to gather information on local woods suitable for bridge and culvert construction on the Pan-American highway, the woodshipbuilding program of the Inter-American Navigation corporation, military construction at cantonments, airfields and military bases and other wartime needs. A survey of sources for quinine supplies also was made in Colombia; and in 1944, at the invitation of the Chilean government, a forest service mission made a survey of the forest resources of Chile.

Throughout the war, work at the Forest Products laboratory, maintained by the forest service in Madison, Wis., was focused on war problems—finding wood substitutes for scarce materials, adapting natural or processed wood to military uses and promoting more efficient wood use. In providing data and specifications on the use of wood for aircraft, in designing economical and serviceable crates and containers for all sorts of military supplies and equipment, including anti-aircraft guns, armoured cars and trailers as well as munitions and other supplies, in training inspectors for wood products and packaging and in broadening the use of plywood, plastics and other chemical derivatives of wood, the laboratory made significant contributions to the war effort.

Many of the new products and processes developed to meet war needs held promise of important peacetime use. Among these were laminated wood, improved plywoods and such new products as "compreg," in which the character of wood was changed by compression and impregnation with synthetic resins. A methylolurea treatment of wood developed by the Forest Products laboratory resulted in making the wood harder, stiffer and more stable dimensionally. The products resulting from this treatment were named "uralloys." The laboratory developed a process for the production of industrial alcohol from wood, and the first commercial plant to use this process, begun during the war near Eugene, Ore., was ready for production in 1946.

Research by the forest service developed methods by which naval stores yields could be increased 40% or more in commercial operations by applying chemicals to freshly chipped pine trees. The method resulted in higher money returns to the operator, ranging from \$400 to \$700 additional net profit per crop of 10,000 trees.

Studies by the forest service at several western forest and range experiment stations pointed the way to successful seeding of valuable forage plants on millions of acres of depleted range lands. Increases in range livestock-carrying capacity of from two to more than ten times resulted from reseeding in accordance with the principles developed.

The decade 1937-46 brought many advances in forest-fire fighting techniques. Tractor-driven plows and "brush-busters," motor trenchers and improved tank trucks and portable pumps were some of the new developments in a trend toward increased mechanization of fire control. The forest service designed portable radio equipment, especially adapted to forest use, for emergency communication.

The possibilities of parachuting men to forest fires in inaccessible areas had been studied by the forest service for many years. The big problem was to devise safe methods of landing men in areas of dense tree growth or rough topography. In 1939, successful experiments in actual jumping were conducted, and the first crew of trained "smoke jumpers" was organized for actual fire fighting work in 1940 in Montana and northern Idaho. During the war, the forest service smoke-jumper corps was manned largely by conscientious objectors who volunteered for this work. The pioneer work of the forest service in this field was of great value to the U.S. army in organizing its parachute-troop units.

A barrage of Japanese balloon bombs presented a new threat to the forests of the western United States in 1945. Balloons carrying incendiary bombs were released in large numbers in the early months of the year, to be carried by prevailing westerly winds to the North American continent. The forest service smoke-jumper corps was augmented by army paratroopers, and other special protection measures were initiated. Although the balloon barrage lasted several months, no serious fires resulted.

One of the worst forest fires, however, occurred in the summer of 1945 in Tillamook county, Ore. Despite the efforts of several thousand fire fighters, the fire raged for nearly two months. It burned over more than 130,000 ac. Much of this area had previously burned over in 1933, and the 1945 fire completed devastation of what had once been one of the finest areas of virgin timber in the Pacific northwest.

In 1937, the chief of the forest service was Ferdinand A. Silcox, who had held that position after 1933. Silcox died in 1939, and for the following three years the service was under the direction of its associate chief, Earle H. Clapp. In Jan. 1943, Lyle F. Watts was appointed chief forester. A career forester, Watts entered the forest service in 1913. He served as a forest assistant, field examiner and national forest supervisor in several western states, as director of the Northern Rocky Mountain Forest Experiment station, and as U.S. regional forester for the north central and Pacific northwest regions. During an absence from the forest service in 1928, he organized and was first dean of the school of forestry, Utah State Agricultural college, Logan, Utah

The shortage of lumber and other forest products which had occurred throughout the war years continued after the cessation of hostilities. Lumber supplies in 1946 were inadequate to meet the demands for new home construction in an acute postwar housing shortage. While manpower shortages, labour strikes and scarcity of operating equipment were factors affecting lumber output, the increasing scarcity of readily accessible, merchantable standing timber was a major deterrent to greater production. The forest service reported that shortages of pine timber large enough to make good lumber were pronounced in various parts of the south. In the west, lumber producers were having to reach toward the more remote stands of oldgrowth timber. Long before the war, the timber shortage had curtailed output in the older timber-producing regions -New England, Pennsylvania and the lake states.

Second-growth stands upon which the nation was becom-

ing increasingly dependent were not producing the quality and kinds of timber needed for many uses. Quality decline was noticeable not only in the growing scarcity of choice, sought-after trees, but also in the general deterioration of many timber stands. Long years of "creaming" the forests for desirable timber, according to the forest service, had resulted in reduction in the percentage of valuable species and a consequent increase in the proportion of low-value trees. A general downward trend in tree sizes was reported in the eastern half of the country, containing three-fourths of the nation's total area of commercial forest land.

Virgin and natural second-growth timber formerly had provided almost the entire supply of wood in the United States. Since the nation was becoming increasingly dependent upon its annual timber crop, positive measures to grow the timber were necessary. To meet the prospective needs of an expanding national economy, the forest service announced, the growth rate of sawtimber in the country's forests should be built up to double the 1946 rate. The forest service recommended a comprehensive national program of forest conservation and restoration, including more intensive protection against losses from fires, insects and tree diseases; large-scale planting to restore millions of acres of depleted forest land to productivity; measures to reduce waste and obtain a more complete utilization of the annual timber crop and action to put a stop to destructive practices and to encourage wider adoption of good management practices in the forests.

Forestry was included among the functions of the United Nations Food and Agriculture organization when that international body was established in 1943. In March 1944, a technical committee on forestry and primary forest products was set up, with representatives of nine nations participating, under the chairmanship of Henry S. Graves, dean emeritus of the school of forestry of Yale university. The committee, in April 1945, issued a report outlining world forest problems and indicating the fields of forestry in which it suggested the F.A.O. should operate.

The technical committee's report called attention to the fact that a timber shortage remained widespread throughout most of the civilized world. "In the face of rapidly multiplying uses for wood which create ever-mounting wood needs," it said, "the world is confronted by the inescapable fact that the forests—sole source of wood—are steadily diminishing." The report pointed out that more than 60% of the softwood timber upon which the world depended for construction material is in North America and Europe. Of the once heavily forested continent of Europe, only three countries still had appreciable quantities beyond their national needs. Life among the crowded millions in China and India was forced to adjust itself to the privations imposed by chronic wood starvation.

The report ranked wood second in importance only to food among the world's raw materials. "Next to agricultural crops," it said, "forest crops have contributed most to human progress and security and, like agricultural crops, forests possess the unique advantage of being renewable. Within wide limits man can adapt them to his needs, and by wise husbandry increase the yield and usefulness of their harvests. . . . Over 90% of the world's annual wood harvest is retained for domestic consumption, yet the remaining 10% has reached third place [outranked only by cotton and wool] in value among all commodities entering international trade, and forest products are among the largest freight customers of the world's railroad and shipping lines. . . . Yet in spite of the proven social and economic benefits that managed forests provide, today less than 15%

Thousands of acres of timberland were destroyed in Big Horn national forest when lightning struck the area on July 31, 1943, causing one of Wyoming's most disastrous fires. Soldiers joined with forest rangers and civilians in attempting to control the spread of the flames

of the world's timberlands are being handled as a renewable, continuously reproductive resource. Twenty percent additional receive some degree of protection but are still regarded as a timber mine, and by far the greater part—about two-thirds of the world's forests—receives neither care nor protection."

In 1946 a permanent Division of Forestry and Forest Products was established under the United Nations Food and Agriculture organization. Marcel LeLoup of France was named permanent director, and international head-quarters were set up in Washington, D.C. LeLoup was formerly chief of the French department of waters and forests, and a member of the French council of state. Stuart Bevier Show, a member of the U.S. forest service, was appointed deputy director. An advisory committee of forestry experts from various member nations was selected.

The international forestry organization prepared to set up world-wide forestry statistical services, assist governments with advice on forest policy, send out missions to make scientific studies, promote research and circulate findings among nations and facilitate exchange of scientific personnel. (See also Tennessee Valley Authority.)

(C. E. R.)

Great Britain.—The hard lessons of World War I led in 1919 to the formation of the forestry commission in Great Britain with the task of implementing a policy of replanting the felled-over woodlands and of greatly expanding the area of forest by new planting. In 1939, accomplishment had not fallen short of plans despite the serious financial difficulties that had been experienced dur-

ing the period of economic depression. An extensive forest area totalling nearly 400,000 ac. had been built up by the state, and it included big new artificial forests such as that around Thetford in East Anglia, with about 40,000 ac. of plantations. Equal progress had not, however, been attained with the replanting and improvement of the 3,000,000 ac. of private forests; in fact about 400,000 ac. that had been felled during World War I had still not been replanted. Although the total area of woodland was thus not very different from the 1919 figure, in 1939 a large proportion carried only young crops, few of which could yield even small timber such as mine props, while many of the older woods had been skimmed at least once of much of their better timber.

Notwithstanding this unsatisfactory position, the woodlands of Britain supplied nearly one-half of Britain's timber consumption in World War II instead of the peacetime 5%, but only at the price of a sacrifice far exceeding that of any other country, even including those in the paths of the contesting armies. About two-thirds of the total standing softwood timber and one-third of the hardwood was felled during the war years, and relatively little could be replanted.

The consequence was that in 1945 Britain had nearly 1,000,000 ac. to replant in order to restore the original area under woodland, and there was a very large further area in which the stocking was so depleted that production was only a small fraction of what it should be.

Plans for a new policy and an expanded program were drawn up in 1944 for presentation to parliament and were for the most part adopted. First the forestry commission was brought under the control of the minister of agriculture. The staff was reorganized with increased decentralization, and separate national committees were set up for England, Scotland and Wales. The new planting program aimed at a total of 500,000 ac. in the next ten years and 3,000,000 in 50 years, at the end of which time the production of the state forests together with the improved outturn from private forests was estimated to meet about one-third of the country's current timber requirements, and the standing reserve should be adequate to tide over a reasonable period without imports.

An important change was the introduction of state control over privately owned woodlands. Owners were invited to "dedicate" their forests to timber production, managing them according to an approved plan and thereby becoming entitled to a subsidy of f_{10} per ac. for new plantations together with g_{s} . f_{10} per ac. per annum for a maximum of f_{10} years for all woodland properly maintained; alternatively the owner could claim annually one-quarter of his net approved expenditure.

Further experience was gained in the improvement of planting methods, notably with the use of specially designed ploughs. Among softwoods, the Scots and Corsican pines, the Norway and Sitka spruces and European and Japanese larches continued to be the main coniferous species planted, with less Douglas fir, western hemlock, etc., while oak, beech and ash were used on suitable sites. The search continued for the best races of these trees for use in Britain and also research on pruning, nursery technique, utilization of small material from thinnings and on many other problems.

The British Commonwealth.—In the commonwealth countries, the major developments during the decade 1937–46 were almost all related to wartime demands. Where there was already a well-developed timber industry and

export as in Canada, it was largely a question of the maximum production possible with limited labour supplies, and inevitably less attention was given to management considerations. In India, too, the demands on the forests not only for sawn timber but also for small material and fuel were practically boundless, and the cut was limited only by shortage of labour and transport. Here, however, great assistance was derived from the existence of detailed management plans, and the damage and disorganization caused by these exceptional fellings were far less than they would have been without such plans; it was estimated that it would take ten years to restore the situation.

Where timber-bearing forests existed but facilities for exploiting them were little developed, as in West Africa, there was again a great drive to train more labour and to improve extraction facilities, and so to increase production.

Whatever the stage of mechanization and industrialization that existed at the outbreak of World War II, expansion took place to an extent limited only by obstacles such as lack of labour, materials or essential machinery. Hand-sawing operations were introduced and greatly expanded in hitherto unworked African forests, while India saw a tremendous increase in its wood industries, e.g., plywood factories increased from 3 to more than 30. These developments seemed likely to mark an important early step in more intensive working and in industrialization.

Several of the commonwealth countries, like Britain itself, had become accustomed to import their timber requirements, especially softwood. During the war they found their supplies cut off, and the same measures were forced on them as in Britain. This involved procuring maximum production of homegrown material and using different kinds of timber for the various kinds of work in place of the customary kinds no longer available. Australia, New Zealand and South Africa all found their extensive exotic softwood plantations of the greatest value, and their further extension was likely to result. Imports were sought from new sources hitherto little drawn-on but still open; thus, South Africa drew on the central African forests to a significant extent. Similarly, where new kinds of timber were found suitable for certain purposes, some at least were likely to hold the place they had attained.

Everywhere, the attention drawn by urgent wartime demands to the importance of wood as a primary product and as the raw material for other industries led to much increased recognition of the need for efficient forest protection and management to ensure maximum sustained supplies. At the same time, realization of the evils attendant on the destruction and mismanagement of the remaining forest resources, which was already spreading during the preceding decade, became much more general, and active steps were taken or at least planned in many countries. In the drier parts of the tropics and subtropics the risks were greatest. Perhaps India, where the problems were doubly acute because of the vast, rapidly increasing population, made most progress in introducing soilconservation measures, including special cultivation methods and plantation work. Another important development well illustrated in India and East Africa was the rapid extension of protection and simple management to village forests and plantations to supply village demands.

A basic requirement for the assessment of resources and their planned management was adequate mapping, and here, too, great progress was made through the use of aerial photography as a far more rapid and ultimately cheaper method than any form of ground survey. Canada led the way in this matter, and the interpretation of aerial

photographs to yield information about vegetation types and tree crops made much progress. Programs for bigscale work were drawn up and work began in several countries. Timber census methods also received a good deal of attention.

Considerable progress was made in the botanical study of the colonial forests and in the foundation of forest schools to train men locally for forestry work.

A significant event also was the creation in 1938 of the imperial forestry bureau financed co-operatively by the commonwealth governments to give an information service to all.

Continental Europe.-Already before World War II, Germany openly began overfelling her forests in order to reduce imports; at the same time a campaign was launched to build up the additional acreage necessary ultimately to meet her full domestic requirements. In 1936, a world forestry conference had been convened at Budapest and, as the outcome of its resolutions, a new international silvicultural centre was set up in Berlin, though only a few countries joined. Germany's policy was then to make agreements with other central European timberproducing countries, giving her control of as large a proportion as possible of the supplies of this important raw material. Moderate overfelling continued throughout World War II, and the forests were then called on to provide much timber by way of reparations and for internal reconstruction, so that it would be long before the final position could be assessed. World War II brought about serious overfelling and much forest destruction in other countries, especially in Poland and Czechoslovakia, but the felling and damage were not so extensive as was thought at first, except over limited areas. Shortages of labour and inadequate transport facilities were undoubtedly the saving cause. One of the most seriously devastated regions was the pine forests of southwest France, where enormous destruction by fire occurred, 500,000 ac. being burnt out.

The years 1937-46 saw increasing recognition of the importance of collecting reliable information as to the timber content of the forests and their growth, and there was continued study of methods of obtaining the required data expeditiously without loss of accuracy by the adoption of appropriate sampling techniques.

Norway and Sweden were particularly active in this direction.

The application to forestry of modern developments in the science of genetics made further important progress, notably in Denmark and Sweden, where research institutions were set up for tree-breeding research. The most interesting results were obtained with intervarietal and interspecific hybrids and with plants possessing more than their normal complement of chromosomes (such as the giant aspen).

Formosa

Also known as Taiwan. Formosa was a province of Japan from 1895 until 1945, when it was restored to China after Japan's defeat in World War II. A large island in the western Pacific, it is separated from China by the Taiwan straits and from the Philippines by the Bashi and Balintang channels. Under Japanese rule, the Pescadores (Bōkotō) and other outlying islands formed a political division of the Taiwan government-general. Area, 13,429 sq. mi.; pop. (1940) 5,872,084. Capital, Taihoku (326,407, census of 1940) in the northern part of the island. Other large towns: Tainan (142,133), Takao (152,265); Keelung (Kirun) (100,151).

Post-Liberation.—After 50 years under Japanese rule, the rich and beautiful Pacific island of Formosa, known to asiatics as Taiwan, was formally surrendered to China Oct. 25, 1945. The transfer back to the country of which Formosa had been a part for nearly two centuries was the result of a decision by President Franklin D. Roosevelt, Prime Minister Winston Churchill and Generalissimo Chiang Kai-shek at Cairo, Nov. 22-25, 1943. For the first time in its history, the white sun and blue sky flag of modern China was hoisted over Formosa at a ceremony

Japanese citizens, carrying their possessions with them, are shown at the bomb-torn capitol building in Taihoku, Formosa, where they were being registered for repatriation in 1946

at the former official residence of the Japanese governor general.

The transfer was certain to strike a heavy blow at Japanese living standards, but the ultimate effect on China and on the Formosans remained to be determined. Both before and during World War II, Japan depended heavily on the island for sugar, rice, camphor, tropical fruits and foodstuffs as well as for the military and naval protection afforded by bases developed there. The Japanese had exploited raw materials and labour to the interests of their home islands, where much food had to be imported even in peacetime.

While sugar refineries, shipping and the larger cities themselves suffered considerably from bombing by United States planes and submarine activity during the war, the sudden removal of the authority under which the islanders had lived for 50 years caused perhaps greater hardships for a time than the war itself.

The industrial breakdown was due in a large measure to a sudden ousting of Japanese engineers, technicians and supervisors under pressure from the U.S. department of state and over the protests of the Chinese government. In July 1946, 7,018 Japanese civilians were retained by the Chinese authorities to help carry on the main industrial and technical work of the province. Of these specialists, 2,739 were employed in mining and industry, 1,162 in communications and 1,205 in agriculture and forestry.

By August of the same year the new rice crop had begun to alleviate the food shortage, which had been due in considerable degree to failure of Japanese to import fertilizer during the war.

Japan brought the sugar industry of Formosa to its height about the year 1942, at which time there were 42 modern refineries in operation in four trusts. This was by far the biggest industry on the island. Nearly all these plants were wrecked or damaged by bombing during the war. Twenty had been put back into operation by May 1946. Up to the outbreak of the war, 650 mi. of government railroad, 320 mi. of private and 1,250 mi. of plantation railroad had been constructed, much of it to serve the sugar industry.

The rice production of the island in 1938 was 1,600,000 tons, half of which was shipped to Japan. By 1939 irrigation had been extended to 62% of all cultivated land. Sugar export in 1938 was about 1,000,000 tons. These two crops probably saved the Japanese from starvation during the war.

War Importance.—Formosa was an important staging base for Japanese troops and for air and naval movements during World War II, also giving protection to shipping between the main islands and the rich overrun territories of the Malay archipelago and the East Indies. It was from bases on Formosa that Japanese bombers struck United States airfields and the Cavite naval base on Luzon in support of Japanese troop landings in Dec. 1941.

The island's southern port of Kaohsiung (or Takao) was a major stop for Japanese convoys, having an extensive protected anchorage for vessels of all draft, and a small, well developed inner harbour, with tank storage and with coastal defense guns. The main naval base was at Mako, an excellent harbour on Oenghu, largest of the Pescadores, a short distance west of Formosa in Taiwan strait. Kilung (or Keelung) on the northwest tip of Formosa, though smaller than Takao, also was a strongly fortified naval, air and seaplane base. Seventeen air bases and a number of landing strips were developed on the main island and the

Pescadores immediately before and during the war, principal among them being Pingtung, Hsinchu and Chiayi. Formosa was heavily garrisoned during the war, with the headquarters of the Japanese army at Taihoku.

It was in the jungles of Formosa that Japanese generals trained their effective jungle fighters before taking them into action in the South Pacific, the Philippines and Malaya.

All principal installations, as well as nearly all industries were heavily bombed by United States airmen during the last two years of the war. The first raid was in Nov. 1943, when the 14th U.S. air force, based in India and China, struck the air field near Shin-chi-ky. Raids by the same force followed at intervals for several months. In Oct. 1944, long range Superforts of the China-India theatre bombed the island, as did carrier based planes from a U.S. naval task force. After Douglas MacArthur partially recaptured the Philippines, increasingly heavy air attacks were staged from U.S. bases there, destroying or damaging most of the important military and industrial targets on Formosa.

For a time, Lieutenant General Jonathan M. Wainwright and some 250 other U.S. prisoners taken by Japanese at Bataan were held on Formosa, as were Sir Mark Young, British governor of Hong Kong before it fell to the Japanese in 1942, Sir Shenton Thomas, governor of the Straits Settlements and many other British officials from Hong Kong and Malaya, together with some Dutch officials from the Netherlands Indies.

Forrestal, James

Forrestal (1892-), U.S. secretary of the navy, was born on Feb. 15, 1892 in Beacon, N.Y. He studied at Dartmouth college, 1911-12, and at Princeton university, 1912-15. Enlisting in the U. S. navy in 1917, he was assigned to its aviation force, received training with the royal flying corps at Toronto, Canada, and was made an ensign in Nov. 1917. Forrestal resigned from the navy with the rank of lieutenant in 1919, and resumed an earlier connection with Dillon, Read and Co., a Wall street banking firm, becoming its president in 1937. He was a moderate New Dealer, favoring cooperation between Wall street and the government and approving of stock-market regulation by the government. In Aug. 1940 he became undersecretary of the navy, serving in that capacity until the death of Sec. Frank Knox, whom he succeeded on May 19, 1944. As secretary he advocated a large postwar navy and peacetime draft.

Forster, Albert

Forster (1902-), German politician, was born Aug. 27, 1902, in Fuerth, Bavaria. His training was for commerce, but after two years of apprenticeship in a bank he was dismissed for membership in the nazi party. He was then a local nazi group leader at Fuerth for five years. Moving to Danzig, he became Gaulester (district leader) of that city in Oct. 1930. In that year also he was elected to the reichstag. In April 1933 he was appointed leader of the Organization of German Employees in Danzig, and four months later was a Prussian state councillor. He also edited the newspaper Deutscher Vorposten. Forster came into international prominence in 1939 during the disputes over the Free City. On Aug. 10, after a visit with Adolf Hitler, he declared the imminence of Danzig's return to the reich, and two weeks later he was elected head of the government of Danzig, replacing Arthur Greiser. On Sept. 1, 1939, the day Germany invaded Poland, he proclaimed in a letter to Hitler the formal reunion of Danzig with Germany. Then Forster sank into relative oblivion, only to surrender to Allied troops in Hamburg in May 1945. He was placed on trial before Poland's Supreme National tribunal in Aug. 1946.

Four Freedoms

When Franklin D. Roosevelt addressed the congress of the United States on "the State of the Union" in a world at war on Jan. 6, 1941, he had behind him eight highly eventful domestic years. No president of the United States, other than he, had ever been officially through more than two terms. The eight years he looked back upon had been, comparatively speaking, a lengthened season of economic depression. Such a season permitted, and might even require, new approaches to national problems, as in this case it had also precipitated a series of international crises.

The president of the United States, leader always of his own party while being at the same time spokesman for the nation and to the world, can never ignore public opinion at home even though he be addressing in intent a world-wide audience. President Roosevelt was fully aware of domestic attention when he applied the Four Freedoms, as he put it, "everywhere in the world." Indeed, he was consolidating the national background to use it as a

beachhead for an already fearful international foreground. He made ready to face with a four-pronged formula that "rendezvous with destiny" to which he was patiently trying to accustom a people proud of their role but provincial in perspective. And this is what he said, as directly relevant to the subject here under consideration:

In the future days, which we seek to make secure, we look forward to a world founded upon four essential human freedoms.

The first is freedom of speech and expression—everywhere in the world.

The second is freedom of every person to worship God in his own way-everywhere in the world.

The third is freedom from want—which, translated into world terms, means economic understandings which will secure to every nation a healthy peacetime life for its inhabitants—everywhere in the world.

The fourth is freedom from fear—which, translated into world terms, means a world-wide reduction of armaments to such a point and in such a thorough fashion that no nation will be in a position to commit an act of physical aggression against any neighbor—anywhere in the world.

To expose the four freedoms, background properly buttressing foreground, it is well to consider the ideals in an order reversed from that of their presentation in the famous address. It was the last two, the negative ones-freedom from want and fear-that Roosevelt had been struggling to secure for his countrymen. The first two, the positive ones-freedom of expression and of worship-were secure in the U.S. as a matter of long tradition and of common reverence. Though established slowly enough and with great difficulty-the thrilling story of colonial and early national history-freedom of worship and of speech were as domestically dependable at the time Roosevelt spoke as anything political could be. Violation of conscience had come to be all but unknown in America and offenses against freedom of expression unusual and infrequent. The president of the republic had every right to be proud of the fact that despite the attrition of a deep and long depression which had tried men's souls and strained their patience, neither freedom of worship nor freedom of speech had been in serious danger during the strenuous decade then drawing to a close.

Suspicion there had been on the part of liberals; doubt there had been on the part of conservatives. Charges indeed there had been on the part of both. But of supporting facts there was such paucity that the president was within his rights in feeling proud of the New Deal record in regard to these positive freedoms that the United States had long symbolized to the world.

That was the background as touching the traditional freedom of speech, and a background no less solid as touching freedom of religion.

But as regards the other freedoms, Roosevelt had opened his first administration with an onslaught against a nation-wide psychological insecurity. Men by the millions found themselves victims of circumstances which they could not control and of forces which they feared because they did not understand. The physical resources of the nation seemed intact; population was replete and still growing; but things were somehow askew, and fear was riding the citizenry—fear and with it not a little want. Roosevelt had electrified the nation upon the occasion of his first inaugural by declaring, in the light of the nation's basic soundness, that it was his "firm belief" that "the only thing we have to fear is fear itself. . . ."

Though there were subsequent noisy domestic battles, freedom of conscience stayed, freedom of speech stood;

fear of extreme want slowly receded; but fear remainednot as at home "nameless, unreasoning, unjustified terror," as he had described the original paralysis; but, on the international horizon, a fear of more than fear itself, a reasonable fear that subsisted, persisted, and in unfortunate lands ran riot upon the rack of concentration camps. There had been a season of easy assurance in the U.S. by those who thought that they "could do business with Hitler." But this shallow version of what was fearful in totalitarianism had slowly given way before successive aggressions in Asia, in Africa, in Europe. The world fear that was gnawing at American hearts was more tangible than any psychological illusion internationally projected. By the time the president spoke, there was coming to be an all-American fear of the most fearful things in human experience: of loss of access to truth and justice, of racial and religious persecution without recourse, of bodily maceration: in fact, of sadism that knew how to break men spiritually as well as physically. This fear which Americans had come slowly to feel for themselves was already rampant throughout the exposed portions of the globe.

The audience, both domestic and foreign, was sensitized to an appeal such as Roosevelt made: those who retained their freedom feared to lose it and those who had lost it hoped almost against hope to regain it. The four-freedoms speech was, therefore, a bid to focus the world's attention upon a common symbolism to turn the edge of desperate fear in all lands. The speech should be judged against its success in achieving and maintaining what Woodrow Wilson's Fourteen Points achieved but found difficult to maintain. As an international statesman, Roosevelt had a threefold task: to steel world opinion against the dictators for the longer and harder pull of war, to prepare U.S. public opinion for stepped-up preparedness and, as it turned out, for eventual intervention on the side of the more democratic forces, and to further the final victory by consolidating all the forces of mankind in a new ideal for what the Fathers had called "the perfectibility of mankind." To get men to believe in the face of disaster, torture and death that continuous struggle was worthwhile, that from cumulated effort something of precious value would dependably come-this was to make propaganda count for all that propaganda was worth.

Whoever shows men that their ideals are not expendable becomes an agent of historic significance at any crossroads of history.

Propaganda and Deed.-As pure propaganda, Roosevelt's speech was undoubtedly powerful. It raised the tonicity of hope in many lands, and in the United States became the norm for future reference and appeal. And well it might; for by preaching against want and fear it appealed to the possessive, the acquisitive instincts of mankind and by preaching up free speech and untrammeled conscience it appealed to the creative impulses of men everywhere. Its success was not tangibly to be measured, but was nevertheless to be discerned through a succession of events, events which at every stage made successful use of the vivid symbolism of creating and enjoying the good things of life. The immediate success was in three stages: the first stage was propaganda of the hopeful word, the second was propaganda of the determined deed and the third was propaganda of the everliving vision of a good age coming on: "a definite basis," as Roosevelt himself put it, "for a kind of world attainable in our time and generation."

Hardly had the sound of the president's voice faded

from the airways of the world when his budget message, of 1941, gave steel-edge to his words. He called for an expenditure of some \$11,000,000,000 for the defense program initiated the preceding year upon the "arsenal for democracy" proposal. The lend-lease program, as psychologically adroit as it was economically ground-based, followed hard upon a program which presently begot \$7,000,000,000 more to implement the determination, as the president put it, "to move products from the assembly lines of our factories to the battle lines of democracies—now."

Meanwhile Secretary of State Hull, in a congressional hearing upon the lend-lease project, had helped mightily the transition from propaganda of the word to that of the deed by declaring that, "It has become increasingly apparent that mankind was face to face with an organized, ruthless and implacable movement of steadily expanding conquest; that we were in the presence of forces which were not restrained by considerations of law or principles of morality; that these forces had no fixed limits for their program of conquest; that they had spread over large areas on land and were desperately struggling to seize control of the oceans as an essential means of achieving and maintaining the conquest of other continents."

Then on April 10, 1941, only a month after the passage of lend-lease, the U.S. department of state announced an agreement regarding Greenland, which had no other thought in its tradition-breaking import "save that of assuring the safety of Greenland and the rest of the American continent, and Greenland's continuance under Danish sovereignty." The agreement, nevertheless, provided for the right of the United States to locate and to maintain air bases there and to do whatever else was necessary to prevent aggression against Greenland and aggression from Greenland against the western hemisphere. This agreement and the lend-lease provisions that began immediately to be implemented, were sufficient to dramatize how without delay propaganda passed from the verbal to the visible, from the symbolic to the substantial.

All of this Secretary Hull made clear in an address to the nation on April 24, 1941. He declared that "the aggressors not only did not wish peace but literally did not believe in it; that behind the deceptive protection of the word 'peace' they accumulated vast striking forces; they infiltrated shock troops disguised as peaceful travelers and business men; they set up organizations for spying, sabotage, and propaganda; they endeavoured to sow hatred and discord; they used every tool of economic attack, bribery and corruption to weaken the countries with which they were at 'peace' until a military movement could easily complete the task of subjugation.

"Peace of that type," he concluded, "was nothing more than a 'trap' into which many nations had fallen in earlier phases of this movement for world conquest when its true nature had not been understood."

Meantime, the secretary undertook to guarantee that continuing U.S. propaganda of the word should not fail to give wings to the deeds that were being struck for freedom. He sent instructions to U.S. diplomatic officers in all neutral European countries to see that neither the words nor the deeds should be hidden under a bushel of politeness to the most impudent forces mankind had yet seen. "The Missions were to stress that we were absolutely convinced that the forces of aggression would be defeated ... we intended to play our part in resistance. ... Therefore it was incumbent upon every representative of the United States and upon every United States citizen abroad to reflect 'the absolute determination' of the United States 'to see this thing through.'"

As uplifted words became thus determined programs of world-shaking action, the double propaganda went unremittingly on. The Office of War Information kept up a barrage round the world, as the war extended and deepened, all in the spirit of the four freedoms and not infrequently in its very terms. A pamphlet was issued by that office-under the title "The United Nations Fight for the Four Freedoms." Beneath an inspiring picture on the front was written "The Right of all Men-Everywhere." This brochure gave interpretation and illustration of these four ideals, and gave both in terms calculated to keep them before world opinion not only as lofty thoughts but also as concrete hopes upon which common men could depend there and now, or very soon. With steady realism of exegesis, this document in all its studied overtones made vivid the possibilities of a better tomorrow for suppressed and suffering millions. Its massive power-for it was the pinnacle reached by propaganda during the war; the only approach, but it a near approach on a world-wide scale, to Tom Paine's achievement during the American Revolutionary War-could best be seen by reading the special introduction to it written by President Roosevelt himself:

The four freedoms of common humanity are as much elements of man's needs as air and sunlight, bread and salt. Deprive him of these freedoms and he dies—deprive him of a part of them and a part of him withers. Give them to him in full and abundant measure and he will cross the threshold of a new age, the greatest age of man.

threshold of a new age, the greatest age of man.

These freedoms are the rights of men of every creed and every race, wherever they live. This is their heritage, long withheld. We of the United Nations have the power and the men and the will at last to assure man's heritage.

The belief in the four freedoms of common humanity—the belief in man, created free, in the image of God—is the crucial difference between ourselves and the enemies we face today. In it lies the absolute unity of our alliance, opposed to the oneness of the evil we hate. Here is our strength, the source and promise of victory.

Here at last was match, and over-match, for Dr. Goebbels, who never wrote anything more heart-warming, more muscle-moving than this.

Though the results were not long in coming, they were never wholly removed from the nostalgia that sees in every achievement "a human dream badly damaged at the birth." At times indeed they were touched at the fringe with frivolity or irony or gaiety.

While each of the Allies had its own favoured symbol of decency and hope, it was safe to say that the four-freedoms formula became and remained the standard U.S. ideological and idealistic thrust through the war and into the future. Its language ran through the Atlantic charter and its intent was not far from that of any subsequent great-power agreement. Consonant with the American tradition, the projection was in terms of the individual rather than of the state. It was even more explicitly so than Wilson's Fourteen Points, for there the emphasis fell upon collectivities and their rights (e.g., group self-determination) more than upon what the individual might hope to get out of the struggle. It was true, but little noticed, that in his war interpretation of the two negative freedoms, President Roosevelt made freedom from fear emphatic upon national disarmament and freedom from want mean economic opportunity on a national scale. Nevertheless, the form of immediate appeal and the residue of meaning that most fully outlasted the war, for the negative freedoms as for the positive freedoms, were individualistic -and were meant to be so. Good propaganda does not scatter its shots. Not only does each man have a hunger to talk and a thirst for worship, but each has also his intimate fears which he would be relieved of and his pressing wants that he would have fulfilled.

The New Freedoms "From."—If the longer U.S. tradition thus got expression in the ringing phrases, the more immediate background of depression also got projected through the formulation into a foreground relatively new to the United States, though so old in general that it had already become traditional in Europe and Asia. This was the "security" motif which the four-freedoms formula connoted. The voice was American, enunciating freedom, but the hands that were working while the voice spoke were weaving newly for American idealism a pattern that was invidiously "foreign." Though the appeal was to the individual, the freedoms "from" which were offered him had to be in large part gifts from authority, not individual achievements under a pioneer economy of self-help.

The Russian pattern had long been set to this ideological configuration, a pattern in which even the tsar was "little Father" no less than Stalin to the little man. In Latin lands, not excluding South America, not only had the state long been paternalistic, more so than in the United States, but the religious environment in which all else found final symbolism was adorned by a spiritual fatherhood personalized as fully beneficent and dispensing to each individual infallible guidance from mortal error. Even in England and other members of the British commonwealth (notably in New Zealand) "socialistic" governments had already one time or more symbolized the Anglo-Saxon drift away from laissez-faire. (Already a half century had passed since the English schoolboy was reported to give as Nelson's dying words: "Every man expects England to do her duty!")

In the United States this drift toward the "welfare state" had come to full consciousness only lately, and had indeed been hailed as beneficent only during the depression under the Roosevelt regime. If before that, state intervention had been necessary to allay fear and to free men from want, it would have been considered a necessary evil. Roosevelt had done gladly what Herbert Hoover had been driven to do grudgingly. This development in attitude was itself a bone of political contention throughout the U.S., in which contention the previous question was constantly being raised: the superior desirability of a "free economy" in which not security but risk was the fecund womb of progress. Instrumentalities of power and influence, however, were in America carrying the day for the new viewthat the state owed to every citizen enlarged security: the security of a job, the security of health insurance, the security of a subsidized old age, etc. Walter Lippmann, accounted conservative, had himself found "the new imperative" in American life to be, by consent of both great parties, that government must accept responsibility for some minimum standard of life for all its citizens. It was this newer tendency domestically which the two freedoms "from" caught up and used to project U.S. war efforts onto a road being graded in America but as yet widely travelled only in older lands.

This projection of the service state did not eventuate without U.S. suspicion and recurring dissent. It was from this dissent, and the lag it superinduced, that there arose the necessity of a final word upon the postwar significance of the war propaganda of the four freedoms. As there were constant party charges that Roosevelt was using his office as commander in chief to the advantage of his own party at election time, so also was there fear, and at times conservative alarm, that he was using the international emer-

gency to consolidate a New Deal program, otherwise slipping at home, with victory on the field of battle, in order to guarantee partisan advantage to a view of national life still in domestic dispute.

The Saturday Evening Post, in a wartime editorial "Four Freedoms Are An Ideal," made the point that the Four Freedoms represented an idealistic conception of man's striving toward a better world rather than a specific program capable of immediate attainment. The editorial allayed the fears of some Americans that the Four Freedoms would be used as a pretext for attempting to foist a world-wide New Deal on distant peoples or to impose on the United States a collective economy. On the contrary, the editorial declared there was nothing in the concept of the Four Freedoms which was foreign to the ideals and ambitions held by American people since the beginning. Wise observers were prepared, however, to find the battle against the "welfare state" long continued in America, with electoral see-sawing which might now and then prove embarrassing to America's international relations (as the echoes of the four-freedoms war propaganda died away).

Nor would such wise observers omit to raise the final question about all propaganda: its effectiveness in getting done what it suffices only to get hoped. Winning the war was more important during the war than reconstruction thereafter. The propaganda was primarily meant to win the war, including that as the major purpose of the fourfreedoms line. Sufficient unto its day is the good thereof. Roosevelt may himself have been prepared to follow through into international deeds what the war kept largely, so far as multi-domestic justice went, to propaganda of the inspired word. But his party, as became manifest to all upon his death, was only half prepared to fight out domestic issues along this line, and as for even one-tenth of a pint of milk for every child throughout the world, did they not have coconut milk at the small self-help of climbing the trees? Probably the deepest undercurrent of American life still ran in all parties against the too close participation of the state in individual activities. Intervention in that most personal of all spheres, religion, was constitutionally forbidden, and was frowned upon elsewhere save as an exception befitting an emergency. As a democratic document, with an eye upon issues of justice, the four-freedoms doctrine had two uses, but also two dangers in the postwar world.

As for its uses, it served mightily to recommend to the whole world the two positive freedoms—of conscience and speech—which were deeply embodied in American tradition, and to keep alive as a concrete ideal in lands more socialistic than the United States the hope that psychological and economic amelioration need not necessarily stop short of "the perfectibility of mankind." The sky was the limit of spiritual hope. To have democracy identify extravagant hope with its own promise to the world may have helped and might again help it through difficult season to compete with the continuing promises of amelioration that communism made to the dispossessed in all lands. As a competitive device, however, the alliance between parliamentarianism and romanticism was not without its own dangers.

Political Gresham's Law.—Two of these dangers were obvious and important. So far as mere promising goes, the bigger promiser is likely to win the day. There is a scrupulosity about democratic promising—at least a vagueness, if not ambiguity, superinduced by advance knowledge

of the slowness of gradualistic means and the poverty of precipitate power—which puts democracy at a genuine disadvantage with those who are convinced of the inevitable fulfilment, cosmically speaking, of all that they promise. More romantic than U.S. war promises were Russia's peacetime promises (operating through class-war means). So far as men took promises in lieu of performance—and the extent was probably greater than realists had ever acknowledged—there seemed to be operative a sort of Gresham's law of politics: that the unrestrained promisers drive out the necessarily restricted performers.

The other danger arose from the fact that at least not all men at all times take promises in lieu of performance. One must therefore make at least a down payment in effort at performance. The danger of romantic hope raised by idealistic promises is that no down payment possible to gradualism will suffice in tensional times. One can make, or seem to make, a larger payment through revolutionary means. But revolution to free men from fear and want is always hard on the two positive members of the four freedoms: speech gets censored and conscience is lucky if it does not get suppressed or free worship at least suffer invasion. The means to freedom from want and fear thus tend to cancel out the ends of freedom of expression and worship. Democracy—with gradualism as its means-finds hard sledding where romantic hope runs high.

It must depend, therefore, on a reduction of the demands for amelioration as well as upon an acceleration of the techniques of collectively supplying what men want. Civilization, as Justice Oliver Wendell Holmes suggested, is the reduction of the infinite to the finite.

Parliamentary government is democracy disciplined through sad experience with revolution into an acceptance of only such measure of state-guaranteed security as is compatible with freedoms like those of speech and conscience. Communism is romantic democracy, undisciplined by the inefficiency of haste and the inhumanity of violence. Discipline men must have, but there is an alternative as to whether it will be inner or outer in texture. Men who indulge in such hopes as cannot be fulfilled through education in the rule of consent and through legislation exemplifying the majority principle will at times be driven by their own impetuous hopes into the use of means that may frustrate some if not all of their ends. Men who temper their hopes by the test of humane means will always be postponing some things they want because they cannot get them without sacrificing other things which they need.

The greatest debits which war bequeaths to peace, when judged from such a vantage as that of the four freedoms, are, on the one side, habits of easy resort to means that circumvent humane ends and, on the other side, the projection through suffering of the hopes that cannot be fulfilled by gradual means-or by precipitate ones either. The printing of the four freedoms on the back of occupational currency was abandoned after the first trial. Since total war cannot be won save through heightened and hardened morale, war always begets a romanticism of expectation which peace cannot live up to. It was this enemy of frustrated hope which the world was to meet in the next eventful years. Whether the four freedoms could survive meeting their own psychological consequences was the test of their eventual success. The issues might well be fought out in a form more clear than war allowed: a contest between the two positive freedoms that are "of" and the two negative freedoms that are "from." The two sets could be harmonized only through great (T. V. S.)

France

France is situated in the west of Europe; bordered on the north by Belgium and Luxembourg, northeast by Germany, east by Germany and Switzerland, southeast by Italy and south by Spain; with the Mediterranean sea on its southeast coast, the Atlantic ocean on the west and the English channel and the North sea to the north. Capital, Paris; government, a constitutional republic; Vincent Auriol, the first president under the constitution adopted in 1946, was elected by the two chambers of parliament Jan. 16, 1947. Area, 212,737 sq.mi.; population (1936 census) 41,907,056 for metropolitan France, but estimated at 2,000,000 less in 1946 in consequence of World War II and postwar deaths resulting directly from the war. Title 8 of the constitution also provided for the establishment of the French union, composed of the French republic and overseas territories or associated states. Language: French; religion: Catholic, c. 1,000,000 Protestants.

The Pre-Munich Nightmare.—On March 7, 1936, a decisive date in prewar history, shortly after the French chamber had ratified its treaty with the soviet union—German troops entered the Rhineland. At the rostrum of the reichstag, Adolf Hitler had declared: "In pursuance of the primitive right which every nation has to safeguard its frontiers and guarantee its means of defense, the German government has re-established the complete sovereignty of the reich over the demilitarized zone."

The French premier replied with a ringing speech which had little effect. France restricted itself to verbal protests and an appeal to the League of Nations; Germany, by a plebiscite on March 29, in which 98.79% of the voters approved Hitler's action, formally confirmed an act which, with popular German consent, was to lead fatally to a new war.

In Spain, meanwhile, the Civil War was complicating an already complex international situation. France, in agreement with the British government, had decided upon nonintervention, but Germany and Italy took the side of Gen. Francisco Franco, and sent the Nationalists troops and materials. The legal government of Spain was abandoned to all intents and purposes; only the soviets, then in the throes of the great "purge," helped the Spanish republic by establishing the so-called international brigades. From this point forward Rome and Berlin acted in solidarity. In Oct. 1936 the axis was born during a visit of Count Galeazzo Ciano, Italian foreign minister and son-in-law of the duce, to Berlin; the two allies together officially recognized the Franco government. Thereafter, the International committee in London was to play only an insignificant and often ridiculous role.

Germany, contrasting the hesitations of England and France with its own resolute will, multiplied its aggressive acts, ended compliance with the Dawes and Young plans, repudiated the clauses of the Treaty of Versailles relating to navigation on internationalized rivers, and increased its military budget. While the French cabinet found itself involved in incessant internal turmoil and King Edward

VIII was abdicating, Hitler, profiting by the confusion of his adversaries, began to look toward Austria. In a series of swift moves (see Austria), he completed the anschluss and proclaimed Austria's annexation on March 15, 1938.

In France, on March 10, 1938, (the day before Germany issued its ultimatum to Austria) Premier Camille Chautemps resigned for reasons hardly known to even his closest associates. Perhaps he felt himself outrun and bypassed by the rapid turn of events. When the second government of Léon Blum was formed on March 13, Austria had been lost. The axis had fortified itself. It was said that Hitler had sent a laconic telegram to Mussolini: "I shall never forget you this."

Joseph Paul-Boncour, the new foreign minister in Paris from March 14 assured Stefan Osusky, the Czech minister to Paris, that France would help his country if it were attacked. In fact, it was Czechoslovakia that Hitler was menacing now.

France had concluded a treaty with that country on Oct. 16, 1925, defining and confirming the one of Jan. 25, 1924. President Eduard Beneš counted not only on the agreements with France but on a treaty of mutual assistance which he had concluded with the soviet union on May 16, 1935, complicated by the fact that when the occasion arose the Russian troops would have to pass through Poland and Rumania, whose attitude had come to be rather doubtful. In France, the Blum cabinet fell on April 8, 1938, and was replaced by a cabinet under Edouard Daladier, with Georges Bonnet as foreign minister.

The drama which was soon to steep the world in blood developed with the logic and the vigour of a classical tragedy. The meeting between Hitler and Neville Chamberlain hardly improved the situation. After his return to London, Chamberlain on Sept. 18 consulted with Daladier and Bonnet, who, according to André François-Poncet, French ambassador to Germany, were agreed to go to war if necessary, but preferred to reach an agreement on the cession of certain Czech Sudeten territories to Germany with the expected consent of the Czech government.

The Czech government accepted the Franco-British proposals on Sept. 21 to cede Germany territories with more than 50% German population; with a guarantee of the new frontiers by France and Great Britain. But Germany demanded still more, and Chamberlain hurried to Godesberg to meet the chancellor again; he found there a categorically stiffened, brutal man.

Justly perturbed, Chamberlain returned to London and there arranged on Sept. 25 for a new meeting with Daladier and Bonnet; Gen. Maurice Gamelin, French chief of the general staff, was also present. All had their backs to the wall.

Munich and Uneasy Peace.—During this critical period, Edouard Herriot had seen Maxim Litvinov, soviet foreign minister, in Geneva, Switzerland, and had had a long talk with him. Both were agreed that only a close agreement among Great Britain, France and the soviet union would serve to prevent Hitler from advancing further. There was only one difficulty: the possible passage of Russian troops through Polish and Rumanian territory. Litvinov thought that France was better qualified than the soviet union to try to solve that problem. Meanwhile, Herriot tried to uphold the courage of the Czechs in frequent meetings with Osusky.

Hitler received Ambassador François-Poncet on Sept. 28

40!

at 11 A.M. The chancellery was in great commotion; mobilization was reported ordered for 3 P.M. A Schutzstaffel (SS) man entered the hall and announced that the Italian ambassador had just arrived with an urgent communication for the chancellor. Hitler left the room and was absent for about a quarter of an hour; when he returned, he said: "Mussolini also asks me to postpone it." At 2:30 P.M., Hermann Goering telephoned François-Poncet that Hitler had proposed a conference for the following day, Sept. 29, at Munich and invited the French premier to take part in it. An hour later the invitation was accepted by Daladier.

During the afternoon of Sept. 29 Mussolini arrived from Italy by railway; Hitler hastened to meet him and entered his carriage at Kufstein. Daladier arrived at the Munich aerodrome at 11:15, accompanied by the acting secretary general and by the French director of political affairs. The conference took place in the fuehrerhaus; it opened at 12:45 and after lunch proceeded to the end of the afternoon. François-Poncet, who took part in it, described the spectacle: Mussolini, sunk into the depths of his easy chair, his face immobile; Hitler upright near him. Germany and Italy hesitated on the question of an international guarantee for the future borders of Czechoslovakia, recalling the claims of Poland and Hungary.

At 1:30 A.M. the following morning the document was signed. The accord provided for the evacuation in four stages of "predominantly German" territories under conditions determined and supervised by an international commission. At 11:30 Chamberlain paid Hitler a visit and, without having informed Daladier (according to François-Poncet), obtained from Hitler a written agreement of nonaggression and friendship.

The Munich agreement, accepted by the Czech government under pressure of circumstances, provoked lively protest. The French chamber, by 535 to 75 voted confidence in Daladier's attitude, which, it must be admitted, had been received with enthusiastic approval by a people that hated war. But the situation remained troubled, and the so-called agreement, fought against by an ardent minority, had not brought any peace to Europe. Polish troops occupied the Teschen area while an autonomous Slovak government was set up under the presidency of Msgr. Josef Tiso, and an arbitrary judgment by Joachim von Ribbentrop and Count Ciano in Vienna gave Hungary approximately 1,000,000 new inhabitants. Europe was disintegrating.

French diplomacy meanwhile tried to obtain from Germany an agreement similar to the one secured by Neville Chamberlain. As France was represented in Rome by only a chargé d'affaires after the departure of the Comte de Chambrun, François-Poncet was sent there as ambassador. He was received by Hitler for the last time on Oct. 18, 1938, not in Berlin or Berchtesgaden, but at a retreat high up in the mountains. Hitler continued his deception, offered to sign a treaty recognizing the existing Franco-German frontiers, accepted the French pact with the U.S.S.R. and ordered Ribbentrop to work out a treaty with his western neighbour.

What was the outcome of this conversation? In Paris on Dec. 6, 1938, Ribbentrop and Bonnet signed a declaration of good neighbourship, solemnly recognizing as final the existing borders between the two countries. "Taking into consideration their relation with third powers," France and Germany agreed "to remain in contact on all questions concerning the two countries, and to consult

mutually in case subsequent developments create the possibility of leading to international disturbances."

Hitler had little regard for this declaration, from the very beginning. On Jan. 30, 1939, speaking before the reichstag and recalling his operations against Austria and Czechoslovakia, he shouted: "In the future we shall not tolerate that the western powers interfere in matters that are no concern of theirs . . . National Socialist Germany and Fascist Italy are strong enough to assure peace against anyone, or to finish with speed and resoluteness any conflict lightly provoked by irresponsible elements." What good was the declaration of Dec. 6? This speech of Jan. 30 enclosed in general assurances of peace a renewed demand for colonies. The new French ambassador in Berlin, Robert Coulondre, quickly realized that if Germany tried to appease the west, it was because that country wanted to be free to move against the east. In principle, the Ribbentrop declaration repeated the proposal that Franz von Papen had made in 1932 at the time of the Lausanne conference. And, as far as central Europe was concerned, Hitler considered it as his private hunting ground. Italy, for its part, denied its assurances of peace with noisy demonstrations for the cession of Nice, Tunisia and Cor-

At Munich, Czechoslovakia had obtained only a respite. When President Emil Hácha dismissed the autonomous Slovak government of Tiso because of its separatist attempts, Tiso appealed to Hitler, who demanded complete independence for Slovakia and the removal of two Czech patriot ministers. The republic's disintegration was rapid; Slovakia and the Carpatho-Ukraine proclaimed their independence. On March 15, Hácha, called to Berlin, placed the destiny of his country in the hands of the fuehrer, "in complete confidence." Hitler entered Prague, installed Konrad Henlein there and on March 16 created the protectorate of Bohemia and Moravia. The governments at Moscow, Paris, London, Washington refused to recognize this coup de force, but too late: Czechoslovakia was dead, with all the liberty, the independent culture, the moral values it stood for. In England and in France. eyes began to open to reality; Poland was the next obvious target.

Stressing his new resistance, Neville Chamberlain declared in the house of commons on March 31, 1939, that in the event of any action menacing the independence of Poland, to which the Polish government judged it vital to offer armed resistance, the British government would hold itself bound to furnish the Polish government with all the assistance in its power. That was straightforward; British policy had been decisively reversed. Hitler, however, replied without delay that he would not be intimidated. The French government meanwhile confirmed its treaty with Poland.

On May 22, 1939, Germany and Italy signed a ten-year treaty known as the "Pact of Steel." Thereafter it was their "Lebensraum," a phrase as dangerous as it was vague, which the two accomplices agreed to defend.

What was France to do? Bonnet had warned Ambassador Johannes von Welczeck that any attack against Poland would provoke French intervention. Ribbentrop wrote personally to Bonnet on July 13 that Germany would never admit "intervention in its own sphere of interests . . . if we have reached the point where the French government wants war, Germany will stand ready at any moment." Bonnet replied on July 21: "France ardently wants peace; no one can doubt that. No one can doubt any longer the resolution of the French government to keep its agreements. But I shall not let it be said that our

honoured its signature."

The situation got worse day by day. On Aug. 23, the nonaggression pact between the soviet union and Germany was signed in Moscow-a veritable thunderbolt. The French General Joseph Doumenc and the British Admiral Sir Reginald Plunkett had gone to Russia to negotiate a military agreement which according to Vyacheslav Molotov was to precede a political accord. Now all hope of an accord with the U.S.S.R. seemed lost. Nothing could stop the tempest. The sending of plenipotentiaries and the exchange of notes were nothing but manoeuvres.

Fatal First of September.-In vain Mussolini had offered at the last moment to call an international conference. On Sept. 1, at 5:45 A.M., the German army invaded Poland without a declaration of war. The die was cast. Hitler declared in the reichstag that "Germany's western border is final," but that Russia and Germany intended to pursue a joint policy.

France mobilized; England introduced conscription of all men between 18 and 41. The French parliament voted for 69,000,000,000 francs in military credits. On Sept. 3, 1939, France and Great Britain were in a state of war with Germany.

During the rest of 1939, except for a small operation in the forest of Warndt, France remained on the defensive. During this period of military stagnation, France was gravely disturbed by internal developments. The Daladier cabinet, reorganized in Sept., dissolved the Communist organizations, thus provoking hatreds which survived the war; obtained full powers and the right to rule by decree; and promulgated a law regarding the expulsion of the Communist deputies who had not broken their relations with the Third International. But it was forced to resign after a vote of no confidence passed by the chamber in secret session. Paul Reynaud now formed a government

Parisians evacuating the French capital in late August 1939, as war clouds gathered in intensity over the European continent

in which Daladier retained the portfolio of war; and France and Great Britain made an agreement on March 28, 1940, not to conclude a separate peace or armistice.

After the German invasion of Norway and Denmark on April 9, 1940, British and French troops sought vainly by their landing at Narvik to counter the German attack. But the operations of the reich in the north were only preliminary actions.

On May 10, Belgium, the Netherlands and Luxembourg were also invaded simultaneously. France and Great Britain sent aid immediately, but again in vain; the French front was pierced at Sedan.

Invasion of France.-German armoured divisions advanced rapidly through the breach they had opened between Namur and Sedan. The Dutch army laid down its arms, and the Belgians, British and French retreated rapidly, fighting against hopeless odds.

At one o'clock in the morning of May 16, 1940, Generalissimo Gamelin made it known that two German armoured divisions might enter the capital that very evening. The military governor of Paris demanded in writing the departure of the government and parliament, which made their dispositions accordingly. Reynaud included the president of the senate and Herriot in the cabinet so that they could discuss the situation together with his ministers. It was in the course of this discussion that the archives of the ministry of foreign affairs were thrown into the garden from an upper story to be burned.

During the day the news became slightly better. Daladier announced that the advance of German armour had not been confirmed. But parliament had suddenly realized the tragic turn of the situation. Paul Reynaud reformed his cabinet and called in Marshal Henri Philippe Pétain as minister of state and vice-premier. Gen. Maxime Weygand was named commander in chief of all the thea-

tres of operations. A counteroffensive ordered by Gamelin failed.

The German army was advancing on Abbeville, Péronne and Cambrai, which it occupied, then on Amiens and Arras, then on St. Pol and Boulogne, then on Calais. It had taken the route toward the sea. On May 28, King Leopold capitulated against the will of his government, which disavowed the surrender. From then on, French defeat assumed the dimensions of a disaster. While the Franco-British army embarked at Dunkirk, and while the Reynaud government was newly reorganized after the departure of Daladier, the fronts which Weygand had tried to establish collapsed one by one. The Germans occupied Rouen and Villers-Cotterets. The government was transferred to Tours.

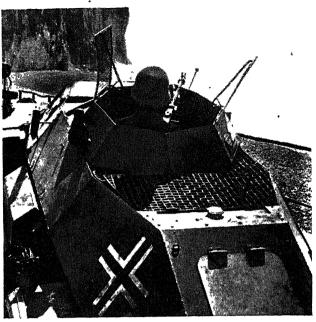

It was at Tours, on June 10, that the government learned of the Italian declaration of war against France and England. The idea of an armistice began to be discussed. Proposed by Pétain and Weygand, it came to light in the cabinet meeting which followed the meeting of the supreme council in which Winston Churchill, Anthony Eden and Clement Attlee had taken part. Paul Reynaud refused. On June 13, the Franco-British supreme council met at Tours; in a small room in the prefecture Winston Churchill wept bitter tears and showed thereby that his heart was as great as his will power. Meanwhile the German army had entered Paris (June 14). The next day, the French government installed itself in Bordeaux. Pétain and Weygand continued to press for an armistice more strongly every day. Chautemps proposed to ask Germany for its conditions with the reservation of refusing them if they were too hard.

Armistice.—In Bordeaux the drama unfolded itself rapidly. Jules Jeanneney, president of the senate, and Edouard Herriot, president of the chamber of deputies, demanded the departure of the government for Algeria. On June 16 there were two successive meetings of the cabinet, one in the morning and one in the afternoon. Churchill submitted to the French government his proposal of a union of England and France. President Roosevelt assured the Allies of his help as long as they would continue their resistance, but did not enter into any agreements of a military nature. Paul Reynaud, placed in the minority, submitted his resignation.

In spite of the suggestion of President Albert Lebrun, Reynaud refused to ask for even a conditional armistice. Jeanneney and Herriot gave him aid by refusing to suggest any other name but his own as successor. On leaving the presidential office, they met in the antechamber a certain number of ministers of the next cabinet, assembled as for a ceremony. Among them was Adm. Jean Darlan, who the night before, in the admiralty building at Bordeaux, had announced to Herriot his resolution of leaving with the fleet if there was talk of an armistice. He had changed his mind and told Herriot now: "A government that leaves never comes back." During the night the Pétain government was formed with Chautemps as vice-premier; Weygand as minister of national defense; Charles Pomaret as minister of the interior; and some others. The foreign minister, Paul Baudouin, was ordered to ask Hitler through the Spanish ambassador for his armistice conditions.

In the meantime the Germans occupied Metz, Dijon, Besançon, Le Creusot and Orléans.

June 17 was an especially dramatic day. Toward noon Pétain announced over the radio to France that he "had

German tank patrolling the channel coast of France during 1940

made it the gift of his person," a phrase often repeated, and that it was necessary "to try to end the struggle." He immediately rectified the latter phrase when Churchill took it up, and, on the contrary, affirmed his will to carry on the fight.

The German army continued its advance across France. On June 18 Gen. Charles de Gaulle made a radio appeal which was the first sign of resistance. He not only raised the courage of the French, but prophesied the future. "Overwhelmed today by mechanical forces, we can be victorious in the future through superior mechanical forces.

The destiny of the world rests in this." On the same day in Bordeaux, Jeanneney and Herriot issued a declaration of the same kind, in the following letter to the president of the republic:

Bordeaux, June 18, 1940.

The President of the Republic:

Yesterday we had the great satisfaction of hearing Marshal Pétain and Minister Baudouin declare that they would accept no propositions which do not respect the laws of honour.

In these hours, when events follow each other so rapidly that they threaten to swamp us, we wish to confirm what we told you yesterday; under no considerations will we conceive of a separate peace as compatible with the honour of France. Such a peace would violate our treaties with Great Britain and Poland, gravely compromise our relations with the United States, ruin our prestige in the world, especially with the people who have joined their fortunes to ours, and, in fact, by the surrender or even the immobilization of our fleet, reinforce our enemies' means of attack against our allies.

We cannot doubt that the government will interpret its own statements in the same way as we do....

At the same time, Jeanneney and Herriot continued their efforts to persuade the government to depart for Algeria. At 5 P.M. on that same June 18, they urged the president of the republic not to let the state be made a prisoner in his person. Albert Lebrun stated that he agreed, but that he submitted himself to the will of the marshal, who did not want to leave the country. He advised them to go and see Pétain, but the two insisted that the marshal come to confer with them. The marshal came; he confirmed that he wished to stay among his fellow citizens, to place at their service the influence he knew

he exerted over the Germans. Herriot replied that a compromise could be found: the marshal could stay and delegate his powers to his vice-premier. Chautemps, who would take with him the ministers of his choice to form a government. Pétain accepted; he even said spontaneously that in order to prevent the departing ministers from appearing to be fleeing the country, he would give them the order to leave.

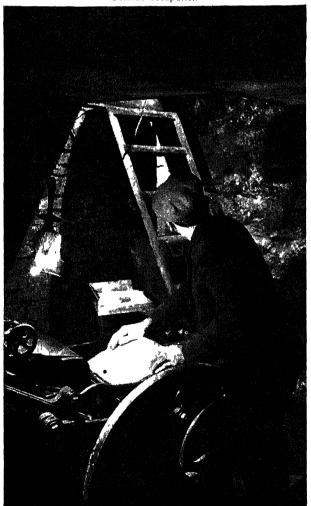

They were to organize in North Africa. Thereupon Jeanneney and Herriot believed that the question was well settled by this formal agreement.

On June 18, Pétain expressly accepted, before the president of the republic and the presidents of the two chambers, the departure of the government with the exception of his own person. But Pétain, urged on by Pierre Laval, postponed the execution of his promises in order to evade them.

On June 19 the Germans crossed the Loire, and Hitler demanded the dispatch of plenipotentiaries, Pétain appointed Generals Charles Huntziger, Parisot, Jean Bergeret, Rear Adm. Le Luc and Ambassador Léon Noel.

As a reward for their collaboration and their actions, Laval and the mayor of Bordeaux, Adrien Marquet, were named ministers of state. Hitler, accompanied by Goering, handed the French plenipotentiaries his conditions, in the same carriage in which the Armistice had been signed in

Individual French resistance, later organized through the F.F.I. dated from the entry of German troops onto French soil in 1940. This picture shows an underground press in operation during the German occupation

1918. The armistice was signed on June 22 at 6.35 P.M. in the forest of Compiègne. Two days later the armistice with Italy was signed.

The Coup d'Etat at Vichy.—On July 2, 1940, the government-the pseudogovernment-of France installed itself in Vichy. The British ambassador, Sir Ronald Campbell, had left Bordeaux on June 23; diplomatic relations between France and Great Britain had been broken off. Proudly the English government refused to negotiate and continued the struggle in spite of the aerial attacks on London, in spite of the bombing of Coventry. From the French point of view, the most important event was the one which was to permit Pétain to establish his dictator-

On July 10 the national assembly, convoked at Vichy, voted 569 against 80, with 18 abstentions (667 members present out of a legal total of 850) for a single article giving full powers to the government of the republic under the authority and signature of Marshal Pétain, to the effect of promulgating by one or several acts a new constitution for the French state. This constitution was to guarantee the rights of "Work, Family and Country"; it was to be ratified by the nation and applied by the assem-

blies created under its provisions.

The evening before, on July 9, Laval had shown Herriot the text of the proposal which he intended to present. The only article of this proposal ended with the following phrase regarding the constitution: "It will be ratified by the assemblies created under its provisions." This text was infinitely dangerous for the republic; it permitted Pétain to have this constitution ratified at once by assemblies under his control. The former servicemen's group of the senate had denounced that peril. Herriot fought during the whole evening of the 9th to effect a change. After a bitter discussion, he obtained from Laval the modification which ordered the ratification "by the nation."

In Herriot's view, good republicans were able to vote for the text of July 10 in the belief that they were not prejudicing the regime, for the assignment was given only to "the government of the republic."

It was Pétain (and not the assembly) who engineered the coup d'état, because he promulgated his three "constitutional acts" on July 11; the first read: "We, Philippe Pétain, Marshal of France, having taken cognizance of the Constitutional Law of July 10, 1940, declare that we assume the functions of Chief of the French State. Consequently we declare: Article two of the Constitutional Law of February 29, 1875, is abrogated." Nothing in the law of July 10 authorized Pétain to dispossess President Lebrun and to "assume the functions of Chief of the French State." The second act read:

(Article 1. Paragraph 1) The Chief of the French State has full governmental powers; he nominates and recalls the Ministers and Secretaries of State who are responsible to him only. (Paragraph 2) He exercises the legislative power in council with his Ministers: (1) until the formation of new Assemblies; (2) after their formation, in case of grave external tension or internal crisis, by his decision alone and in the same form. Under these same conditions he is entitled to make all dispositions of a budgetary and fiscal nature. (Paragraph 3) He promulgates all laws and attends to their execution. (Paragraph 4) He nominates all civil and military officials for whom the law has not laid down another mode of selection. (Paragraph 5) He controls the armed forces. (Paragraph 6) He holds the right of pardon and amnesty. (Paragraph 7) The envoys and ambassadors of foreign powers are accredited to him; he negotiates and ratifies all treaties. (Paragraph 8) He is entitled to declare a state of siege in one or more sections of the territory. (Paragraph 9) He cannot declare

Stigmatized by shaven heads, French women collaborationists were followed by a jeering crowd down a street in Chartres after the city's liberation by the Allies, Aug. 17, 1944

war without the previous consent of the legislative assemblies. (Atticle 2) All provisions of the constitutional laws of February 24 and 29, and July 16, 1875, are abrogated as being incompatible with the present Act.

It was Pétain therefore who, on his own initiative and without the consent of parliament, destroyed the constitutional laws of 1875. His acts were illegal; it sufficed to state this in order to re-establish these laws, with the reservation of modifying them at once by legal procedure.

Act no. 3 maintained the senate and the chamber but adjourned them; they were not allowed to meet again except when convoked by the chief of state.

On July 12, a new government was nominated with Laval as vice-premier; Raphael Alibert, justice; Marquet, interior; Baudouin, foreign affairs; Marcel Bouthillier, finance; Gen. Weygand, national defense; Adm. Darlan, navy; Francois Pietri, communications.

Despotism.—After the coup d'état of July 15, President Lebrun left Vichy. A new supreme court of justice was created, and Gen. de Gaulle was condemned to death in absentia as a deserter. Secret societies were dissolved; Gen. Weygand was sent to North Africa as the delegate in chief of the government. Daladier, Reynaud, Gamelin and Georges Mandel were interned at Chazeron in the Puy de Dome. Herriot was dismissed as mayor of Lyons.

Pétain no longer hid his plans. In an article entitled "Politics of the Future" in the Revue de Deux Mondes, he dared write: "We have less difficulty in accepting the National-Socialist idea of the pre-eminence of work and of its essential reality in connection with the fiction of monetary conventions as it has formed part of our classical tradition." And Laval stated in the Belgian journal La Legion: "The Republic has ceased to exist in France."

Thenceforth, acts of brutality were to follow each other: the impeachment of Daladier and Gamelin before the court of Riom; the internment of many Frenchmen in Pellevoisin; the laws against the Jews; the accusations against Blum, Mandel and Reynaud; the appointment of Laval as foreign minister; dissolution of the general labour union; the arrest of Léon Jouhaux. On Dec. 13, 1940, an unexpected development surprised the people: Pierre Laval was dismissed and replaced by Pierre-Etienne Flandin, while Ferdinand de Brinon was appointed delegate general of the government in the occupied territory.

The official journal of the French republic became the journal of the French state. A national council was created (this should, under the Jeanneney-Herriot precautions, have ratified the constitutional acts). The "Rassemblement National Populaire" (Popular National Movement) united the principal collaborators around Eugene Deloncle, Marcel Déat, Charles Spinasse, Marquet, Pierre Cathala, Jean Luchaire, Georges Suarez. A new constitutional act made Adm. Darlan the deputy and possible successor of Pétain. One thing could not be doubted: the members of the "Rassemblement National" wanted to achieve "the integration of France into Europe and in the National Revolution." The system of Hitler triumphed; it pursued with tenacity the adherents of De Gaulle.

The Vichy police arrested foreign Jews in great numbers, and fought, as well as it could, against clandestine radio broadcasts which sustained the courage of the patriots. Darlan and Marcel Déat continued to praise totalitarian government; Weygand became governor general of Algeria while Pierre Pucheu was made minister of the interior. Marx Dormoy, the mayor of Montluçon who had been dismissed the same time as Herriot, was assasinated at Montélimar. Pétain himself was forced meanwhile to acknowledge in his speeches the existence of an opposition, still mute, which was rising in different parts of the country. In June 1941 Hitler had attacked the soviet union, and Vichy had broken off diplomatic relations with that country. At home, Germany forced upon

France measures against the Communists, and Minister Pucheu obeyed them; some militant ones were put to death.

After having suppressed parliamentary inviolability, Pétain forced officials to give an oath of fidelity and created the state tribunal. In Feb. 1942 the trial of Gamelin, Daladier, Léon Blum, Guy La Chambre and Pierre Jacomet began before the court of justice at Riom, it was suspended, apparently, by German orders. Pétain now declared himself to be in complete accord with Laval, for whom he created the title of "chief of government." Together they followed "the organization of Europe," that is to say, Hitler's plans. The resistance, however, grew in strength from day to day. Pétain realized it and admitted it in his message of June 17, 1942: "I am under no illusion as to the weak response which I have received to my appeals." And even Laval let his disappointment be known.

Jeanneney and Herriot had succeeded in making the offices of the two chambers of parliament function in spite of all difficulties. On Aug. 29, however, Pétain suspended them.

Allied Landing in North Africa.—French patriots did not have to wait long for the reward for their faithfulness. On Nov. 8, 1942, Allied forces landed in North Africa, and the Germans, breaking the armistice agreement, invaded the unoccupied zone of France. Prime Minister Laval saw his powers increased. The French fleet scuttled itself. The French militia was formed with Joseph Darnand as its head. A law creating compulsory labour service sent many young Frenchmen to Germany. Blum, Daladier, Reynaud, Mandel and Herriot were handed over to German authorities.

While these events were developing in the interior, what was the attitude of the Vichy government with regard to external affairs? It had held the Montoire meeting of Sept. 1940, and the principles of "collaboration" had been laid down officially. On June 22, 1942, a day of shame, Pierre Laval brazenly declared: "I wish for the victory of Germany." To this he added on Dec. 13: "An American victory would mean a victory for the Jews and Communists."

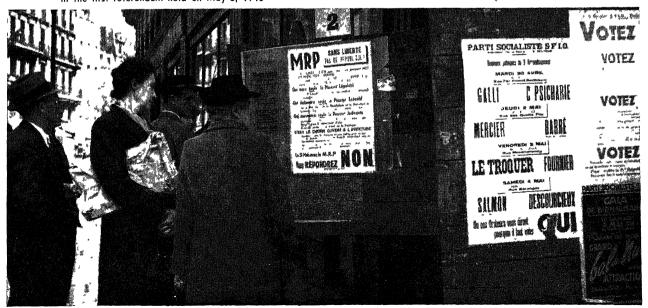

French citizens scanning posters in which they were urged by the Popular Republicans (M.R.P.) to vote against, and by the Socialists to vote for, a proposed new constitution, later narrowly defeated in the first referendum held on May 5, 1946

After the appeal of Gen. de Gaulle on June 18, 1940, the French resistance had never stopped increasing. The head of the Free French had concluded agreements with Churchill regarding volunteers. The New Hebrides, the Ivory Coast, the Chad, the Camerouns, Tahiti, Gabun joined De Gaulle; the battle in the Levant began. A French Committee of National Liberation was set up.

The Anglo-U.S. landing in North Africa raised the courage of all. The resistance continued to grow, after the assassination of Darlan in Algiers and the conference of Casablanca. In Feb. 1943 the armies in North Africa rejoined those of Gen. Jacques Leclerc at Ghadamés. Tunisia was liberated. In June the French Committee of National Liberation was set up in Algiers, with the task of "exercising French sovereignty over all the territories placed outside the power of the enemy." "Liberation first, liberty afterwards," proclaimed De Gaulle. The fall of Mussolini was an unmistakable portent of the defeat of the axis. Italy capitulated, and French troops disembarked in Corsica. A provisional consultative assembly was created; its first session opened at Algiers in Nov. 1943.

Landing in Normandy.—On June 6, 1944, the Allies landed on the coast of Normandy, and shortly thereafter liberated Bayeux, Isigny, Carentan, Cherbourg, Caen, Coutances and later Vaumas, Saint Briac, Quimper, Le Mans, Nantes, Angers. On Aug. 24 at 9.30 P.M. the advance elements of Leclerc's armoured division arrived at Paris. On Aug. 25 at 7.30 P.M. Paris was liberated. Laval had come himself to see Herriot at Nancy, where the latter was interned, to take him to Paris to be interned in the city hall. What was his idea? He only hinted at it. It seemed that he wanted to convoke the national assembly, hand it his resignation and permit Herriot to take his place. But Herriot refused to be associated with him in any way, and under Hitler's orders (as Laval said at the trial of Pétain), Herriot was sent eastward toward Germany.

From then on, events moved rapidly. On Aug. 19, 1944, the Allies landed on the coast of Provence. On Sept. 13, the northern armies met those of the south in the region of Dijon. The battle of the Rhine began. In spite of Laval's prediction, the German army was defeated. The

412 Laval government had left Paris on Aug. 17, thus preceding the Parisian uprising and the liberation by a few days.

Gen. de Gaulle was now installed in Paris. "France," he said, "comes home again." The consultative assembly returned from Algiers; De Gaulle formed his government and announced the re-establishment of the legality of the republic. A decision of the cabinet fixed the dates for the elections to the municipal and general councils; the court of justice was organized. In Dec. 1944 Gen. de Gaulle travelled to Moscow to sign a treaty of alliance and mutual aid with the soviet union.

Fourth Republic.—The problem after liberation was one of national reorganization. Political trials followed each other; Pétain was condemned to death, but his sentence was commuted by Gen. de Gaulle to forced labour for life. Laval, Suarez, Darnand, Luchaire were executed.

Two solutions were advanced to the political problem of the new fourth republic. In the opinion of some, it was sufficient to annul the constitutional acts of Pétain, to hold elections for the two chambers and to revise the constitutional laws of 1875. After some hesitation, Gen. de Gaulle preferred to submit to a popular referendum an electoral law founded on proportional representation and a new constitution.

In the elections of Oct. 31, 1945, the second solution triumphed, largely because of the newly-granted suffrage to women. The elections gave a majority of seats to three parties which promptly called themselves the "Big Three," and which combined to form a government under the leadership of Gen. de Gaulle: the Communist party, with Maurice Thorez as secretary general; the Socialist party, whose leader, who did not stand for election, was Léon Blum; and the so-called Mouvement Républicain Populaire (Popular Republicans) with Maurice Schumann as its leader (his voice had so often been heard over the English radio during the German occupation). This new party had no strictly outlined program; it was attached to the Christian Democratic movement, and was supported by the Catholic Church. The Big Three voted for the nationalization of banks, gas and electricity. They worked out a constitution based on the rule of a single assembly, reducing the president of the republic to an insignificant place and subordinating the judicial power to the politi-

The first constituent assembly was only provisional. Gen. de Gaulle suddenly retired on Jan. 21, 1946, and was succeeded by Félix Gouin, who subsequently was elected president. The proposed constitution was rejected by the French people by a majority of 1,200,000 votes. (See Elections.)

The second constituent assembly, elected on June 2 in the same fashion as the first one, returned the Big Three to power in spite of a small advance of the minor parties; Georges Bidault, leader of the M.R.P., was named premier to head the three-power coalition. It went to work once more on a new draft, which was approved by a majority of about 1,000,000 votes on Oct. 13 and thus became the fundamental law of the fourth republic. At the national elections of Nov. 10, 1946, the Communists emerged as the most powerful French party, with M.R.P. a close second and the Socialists third. Bidault resigned as premier in December and was succeeded by Léon Blum. (See also Communism; French Colonial Empire; International Law; Socialism; World War II.)

Franco, Francisco

Franco (1892—), Spanish soldier and statesman, was born Dec. 4, 1892, at El Ferrol, Galicia, and was graduated from the military academy of Toledo in 1910. After a period of military service in Morocco, he served as director of the military academy at Saragossa, Spain, from 1928 to 1931; when the new republican government dissolved the promonarchist academy, Franco went into semibanishment. He returned to politics with the victory of the right in the elections of Nov.-Dec. 1933; it was he who was responsible for the use of Moroccan troops in the suppression of the general strike of Oct. 1934. In

1935 he was appointed army chief of staff by Gil Robles, minister of war.

Franco played a prominent part in the early days of the Spanish civil war (1936-39) in organizing and transporting Moroccan troops to Spain. Following the death of Gen. José Sanjurjo in July 1936, he became the military and civil leader of the rebels. After a bitter threeyear struggle, in which he received considerable aid in the form of men and matériel from Adolf Hitler and Benito Mussolini, Franco defeated the Loyalists in 1939 and emerged as the caudillo (leader) and prime minister of Spain. During the first years of World War II, when the axis was victorious, Franco affirmed Spain's solidarity with Germany and Italy in the struggle against "bolshevism." When Allied arms began to triumph he hastened to profess his neutrality and denied that Spain had been fascist or secretly allied with the axis powers. In 1945, following the collapse of Germany, he claimed that Spain was not a dictatorship. To support this claim, he issued, on Oct. 22, a "bill of rights" which included freedom of worship and expression and the right to petition, provided, however, that these liberties did not run counter to the "fundamentals of the state." In June 1946, in spite of Franco's protestations of peaceful and democratic intentions, his regime came up for consideration before the United Nations organization as a potential threat to world peace. (See also Spain.)

Frank, Hans

Frank (1900–1946), German jurist and politician, was born May 3, 1900, in Karlsruhe. A student of economics and jurisprudence, he studied at the Universities of Munich, Vienna and Kiel and received his doctor's degree from the latter institution in 1924. He afterward taught law and maintained a practice in Munich. In 1930, he joined the nazi party, becoming a member of the directorate, and later became reichstag president and commissioner of justice in the nazi administration. In 1933, he was named Bavarian state minister of justice. Through his office of president of the Academy for German Law, Dr. Frank made adjustments in German law to fit the needs of naziism.

After the collapse of Poland, Frank was appointed supreme chief of Poland's civil administration attached to the staff of Marshal von Rundstedt. In 1942, the Polish government in exile charged that Frank had ordered the execution of 200,000 Poles, suppression of Polish citizenship, confiscation of Polish property, enslavement of hundreds of thousands of Polish workers shipped to Germany, and herding all remaining Jews into ghettos.

Frank was captured by U.S. army troops in Berchtesgaden on May 4, 1945, and was indicted for trial as a war criminal before the International Military tribunal at Nuernberg. The court's verdict corroborated the previous charges made by the London Poles and in addition revealed that Frank had intended to reduce the Poles to slave status. He was further held responsible for the ghettos and the brutal extermination of the Jews. Found guilty by the court of war crimes and crimes against humanity, he was sentenced to hang. Sentence was carried out Oct. 16, 1946, at Nuernberg, Germany.

Frank, Karl Hermann

Frank (1898–1946), German politician, was a bookseller before he turned to politics as Sudeten "irredentist," agitating for the return of the German-speaking provinces of Czechoslovakia to the reich. Rising to the Sudeten party directorate, he represented it in the Czecho-

slovak parliament from 1935 to 1938. After Adolf Hitler annexed the Sudetenland following the Munich agreement of Sept. 1938, the party was absorbed by the nazis and the following year, Frank was named state secretary to the reich protector for Bohemia and Moravia, and concurrently held the rank of minister. After Reinhardt Heydrich, reich protector of Bohemia and Moravia, was assassinated by Czechoslovak patriots in 1942, Frank ordered the execution of the male population of the villages of Lidice and Lezáky. He surrendered to the U.S. army near Pilsen, Czechoslovakia, May 9, 1945. Questioned at Wiesbaden, Germany, he admitted signing the decree ordering the execution of all persons (together with their families) who assisted in the attempt on Heydrich's life, or who failed to report the identity or whereabouts of the assassins. He stated that on the same day, he had received instructions from Hitler's headquarters to execute 30,000 to 40,000 politically suspect Czechs as a reprisal for the slaying. Frank insisted that he flew to Berchtesgaden to protest the order and that while he was in Berlin the massacre of Lidice was carried out by a special execution company sent from Berlin. Convicted by a people's court in Prague for the Lidice massacre as well as for other war crimes, he was hanged in the Pankrac prison courtyard, May 22, 1946.

Frankfurter, Felix

Frankfurter (1882-), U.S. jurist, was born in Vienna on Nov. 15, 1882, and emigrated with his family to the U.S. as a child in 1894. He graduated from the College of the City of New York in 1902 and was granted his degree of bachelor of law with highest honours from Harvard four years later. After completing his legal education he became assistant to Henry L. Stimson, then U. S. attorney for the southern district of N.Y., and enthusiastically joined the "trust-busting" campaign of Theodore Roosevelt, helping to prosecute several large corporations. In 1911 he was appointed a law officer in the bureau of insular affairs in Washington, D.C., and remained there for three years until he was offered a professorship of administrative law at Harvard in 1914. Except for various leaves of absence he remained on Harvard's faculty thereafter. During World War I he was assistant to Secretary of War Newton D. Baker, assistant also to the secretary of labour, counsel for the president's Mediation commission, and chairman of the War Labour Policies board. At the Paris peace conference in 1919 he represented the Zionist cause.

During his legal career he supported labour legislation and the principle of government initiation of social welfare projects. He was also active in cases involving the infringement of civil liberties, publicly associating himself, for example, with the defense in the Sacco-Vanzetti case of 1926. A member of President Franklin D. Roosevelt's "brain-trust," he was appointed associate justice of the supreme court on Jan. 5, 1939, to fill the vacancy caused by the death of Benjamin N. Cardozo.

Fraser, Baron

Lord Fraser (1888-), British naval officer, was the son of an army general. Educated at Bradfield, he later joined the royal navy and was a gunnery officer in World War I. In 1926 he constructed an improved firecontrol table which provided for greater accuracy in longrange firing. He was a flag captain in the East Indies and then was assigned to the battleship "Warspite" as chief

413

of staff of the Mediterranean fleet. Fraser was third sea lord and controller in the admiralty from 1939 to 1942, having been promoted to vice-admiral in May 1940. He was second in command of the British home fleet in 1942 and commander in chief of the home fleet in 1943–44. In 1944, he was promoted to the rank of full admiral and given command of the British eastern fleet based at Ceylon, the force which assisted the land operations of Lord Louis Mountbatten's troops in the Burma-India theatre. When the British Pacific fleet was formed in Dec. 1944, he was chosen as its commander in chief. Units of this force joined the U.S. fifth fleet in attacks against the Ryukyus and the Tokyo area in the spring and summer of 1945.

At the surrender ceremonies aboard the U.S.S. "Missouri," he represented the United Kingdom and signed the Japanese surrender document on Sept. 2, 1945, which formally ended World War II. On Jan. 1, 1946, he was created a baron.

Fraser, Peter

Fraser (1884—), New Zealand statesman, was born in Fearn, Ross-shire, Scotland, and went to New Zealand in 1910. He worked as a longshoreman, became interested in trade unionism and joined the New Zealand Labour party. He was elected to the New Zealand house of representatives in 1918 as a Labour member. In 1935 he was appointed to the government as minister of health, education and marine.

Fraser became deputy prime minister in 1939 and prime minister the following year.

During World War II Fraser made frequent trips to Australia, Britain and the United States for consultations with other Allied leaders on strategy and related problems. In 1944 as the issue of the final disposition of the Pacific bases began to occupy the attention of Allied diplomats, Fraser urged Secretary of State Cordell Hull to call a conference of the Southwest Pacific powers to discuss the issue. Fraser represented his government at the United Nations conference in San Francisco, Calif., in 1945, and joined the smaller powers opposing the big-power veto. At the U.N. assembly sessions in London in early Jan. 1946 Fraser reiterated his opposition to the veto and expressed his conviction that it could not endure. On Jan. 18, 1946, he spoke against the proposal to put the atomic commission under control of the security council instead of under the jurisdiction of the general assembly.

Fredendall, Lloyd R.

Fredendall (1883—), U.S. army officer, was born Dec. 28, 1883, in Wyoming. A cadet at the U.S. Military academy, 1901–02 and 1902–03, he was commissioned a second lieutenant of infantry in 1907. During World War I he served as Gen. John Pershing's staff assistant. In 1942 he was placed in command of the U.S. 2nd army corps in North Africa until he was replaced by Gen. George Patton during the Tunisian campaign. On his return to the U.S. he was made commander of the second army at Memphis, Tenn., replacing Gen. Ben Lear. On May 27, 1943, he was promoted to the rank of lieutenant general. Until Jan. 1944, when his position was abolished as the result of consolidation with the eastern defense command, he was also commanding general of the central defense command.

French Academy

After having brought out the eighth edition of its Dictionnaire de l'usage (Paris, 1935) on the third centenary of its foundation, the French academy undertook the preparation of a new edition. Although in the course of five years three permanent secretaries died (René Doumic in 1937, Georges Goyau in 1940, and André Bellessort in 1942) and a fourth (Georges Duhamel) resigned at the beginning of 1946, work on the dictionary went forward without delay.

During the German occupation of France, the academy voluntarily denied itself any form of public expression, although at all times it discreetly showed its firm intention of having nothing to do with the Germans. It suspended all its publications and abandoned all attempts to fill the gaps in its ranks occasioned by the death of Henri Lavedan (Sept. 3, 1940), Henri Bergson (Jan. 1, 1941), Marcel Prévost (April 8, 1941), Louis Bertrand (Dec. 6, 1941), Émile Picard (Dec. 11, 1941), Edouard Estaunié (April 2, 1942), Cardinal Baudrillart (May 19, 1942), Marshal Franchet d'Espérey (July 3, 1942), Louis Gillet (July 1, 1943), Gabriel Hanotaux (April 11, 1944) and Paul Hazard (April 12, 1944): in this way it avoided the customary reception ceremony which would have risked bringing to the academy representatives of the German authorities

The reserved attitude of the academy during the occupation was often misunderstood and attacked. In fact, the academy lent its secret support to French resistance, at the same time helping many victims of the occupation and aiding writers who refused to publish under the German regime. It was the academy which, in 1942 and 1943, on All Saints' day caused wreaths to be laid at the cemetery of Ivry on the graves of those shot for political reasons.

During the occupation the academy was able in spite of difficulties to bestow all its prizes for literary productions, as well as those for acts of courage and devotion. Between 1941 and 1945 it awarded prizes to 173 writers held as prisoners of war in Germany. For the names of the successive holders of its principal literary prizes, see LITERARY PRIZES.

After the liberation the academy resumed its elections, making every endeavour to attain the 40 members ruled by its founder in 1635, after being reduced to nearly half that number by 1944. On Oct. 12, 1944, Prince Louis de Broglie, André Siegfried and Pastor Vallery-Radot were elected. New vacancies were created within the academy after the winter of 1944 by the death of Maurice Paléologue (Nov. 18, 1944), Maurice Donnay (March 31, 1945), Paul Valéry (July 20, 1945), Joseph de Pesquidoux (March 16, 1946) and Octave Aubry (March 27, 1946). Furthermore, the academy severed connections with Abel Bonnard, Abel Hermant, Charles Maurras and Marshal Philippe Pétain for their roles during the occupation. Between Jan. 1, 1945, and June 30, 1946, the following elections were made: Edouard Le Roy, Emile Henriot, Jean Tharaud, Baron Ernest Seillière, René Grousset, Robert d'Harcourt, Octave Aubry, Paul Claudel, Maurice Garçon, Count Charles de Chambrun, Marcel Pagnol, Henri Mondor and Jules Romains. On July 1, 1946, five seats remained vacant. (H. DE M.)

French Colonial Empire

Metropolitan France with its overseas dependencies formed, in 1937, the French empire. The words "French empire" may convey a wrong idea of the part played by France toward the peoples grouped under its flag; nevertheless, they were current usage throughout the decade 1937–46 and are, for that reason, being used here.

French overseas territories are to be found in Africa, Asia, Oceania and America. Their area in 1937 comprised 4,683,625 sq.mi., that is to say, more than 22 times that of France. Their total population then amounted to 70,000,000 inhabitants. Beginning with Africa and continuing around the world eastward, Table I, valid for 1937, summarizes statistics of populations and areas.

Toward Reform. On Nov. 3, 1936, a conference of the colonial governors general opened in Paris which was to

*All returns for the year 1936.
†Algeria comes under the ministry of the interior; the colonies come under the colonial ministry (in 1946 ministry of overseas France); the protectorates and mandated territories are the responsibility of the ministry of foreign affairs.

solve the problems raised by the administration of the overseas territories. The government pursued two aims: social justice and an improvement in the standard of living of the masses by appropriate reforms in the economic structure. Fiscal burdens in the colonies were lightened, leaving the native a bigger proportion of his earnings. Colonial budgetary charges were reduced, local production was developed, the market prices of colonial products were raised. An attempt was made to obtain from parliament the creation of a colonial equipment fund to meet the necessary works of re-equipment. Such in their rough outlines were the problems examined at the conference of the governors general. The effects of the decisions taken soon made themselves felt in the overseas territories. New projects were placed on the agenda: public health, protection and regulation of labour, education, maternity and child welfare, progressive access to new rights. In all these spheres the guiding ideas were progress and reform.

The figures in Table II measure the magnitude of the effort made to develop French colonial economy immediately before the outbreak of World War II.

In 1987 France depended on the sea for exactly onehalf of its foreign trade. The part of the empire in this maritime commerce is summarized in Table II:

Table II							
	lm	ports		Exp	orts		
	Empire short tons	Total short tons	%	Empire short tons	Total short tons	%	
1937 1938	8,073,487 8,279,167	40,130,716 36,916,953	19.62 22.42	2,613,320 2,633,244	7,718,587 8,125,025	33.85 32.40	

In gross tonnage, and for the year 1937, the empire supplied 20% of French imports and took 34% of French exports. For a better analysis of this situation Table III provides a breakdown (for 1937).

These statistics refer only to the trade between France and its colonies. They do not give a complete picture of the production and foreign trade of the empire, for the latter was far from constituting a closed economic system. Table IV shows for 1937 the shares (values) of the other

colonies, foreign countries and the metropolitan area respectively in colonial trade.

Of all the foreign countries which normally traded with the French empire, the largest share fell to Great Britain. In 1937 Britain exported to most of the French colonies coal and various industrial products, notably cotton fabrics. In return Britain received from North Africa phosphates, iron ore, alfa-grass; from Indo-China rice and hides; from French West Africa oleaginous products and timber; from Madagascar phosphates and hides. Furthermore, Indo-China maintained a considerable trade with the emporia of Hong Kong and Singapore.

Overseas France in the War.—The remarkable effort accomplished by overseas France continued during the first months of the war, under the driving force of Georges

Mandel, who became minister of the colonies in 1938 and was later assassinated by the Germans. This great leader gave a new impetus to all branches of agriculture and industry in the colonies. Its practical result was the dispatch during World War II of many hundred thousand tons of colonial products to metropolitan France and to friendly countries, in particular Great Britain. Military recruiting was also actively pursued. Many new contingents were trained and used to build roads and complete the defensive or economic equipment of the territories. During the campaign in France the colonial armyl-one army corps and eight divisions-had taken part in some heavy fighting and lost three-quarters of its effectives. Then came the armistice of June 1940. France seemed then to have lost everything. Yet, one by one, the colonies answered Gen. Charles de Gaulle's call from London. French Equatorial Africa, the French Indies, the Pacific territories, the Camerouns, St. Pierre and Miquelon had rallied by 1940. Syria followed them in 1941. In 1942 it was the turn of Madagascar, French West Africa, Réunion and French Somaliland. The Antilles and Guiana followed in 1943. As soon as they had rallied, each colony raised troops which took part in the struggle in which France's overseas bases and territories played a decisive part by the mere fact of their strategic position.

Overseas France threw into the struggle tens of thousands of soldiers who fought on all fronts. As early as Dec. 9, 1940, when Gen. Sir Archibald (later Field Marshal Lord) Wavell launched the first offensive in Libya, a French contingent took part in the assault on Sidi Barrani. In Feb. 1941 French troops, under the command of

 $^{1}\mathrm{No}$ account taken of troops from North Africa, attached to the metropolatan forces.

Gen. Jacques Leclerc, captured the oasis of Kufra in Libya and raided Murzuk. In February and March 1941 French troops fought in the campaign of Eritrea, taking part in the battles of Kub-Kub, Keren, Massawa. In June and July 1941 they campaigned in Syria. From January to June 1942 they won renown in the course of the second Libyan campaign, at Halfaya, at Mechili and, above all, at Bir Hacheim, where a French brigade held out for 11 days against the Ariete armoured division until ordered to retire, thus covering the left flank of the British 8th army. In February and March 1942 they made new incursions into the Fezzan.

From October to December of the same year they took part in the third Libyan campaign and inflicted severe losses on the axis at El Alamein, Himemat and Bengasi. In December, under Gen. Leclerc's command, they conquered the Fezzan reaching Tripoli in Feb. 1943. There followed the campaigns of Tripolitania and of Tunisia in which the 1st Free French division took 28,000 prisoners, and the Italian campaign where the French expeditionary corps broke through the Gustav line, opened the road to Rome, but lost 42,000 men. On the material side of the war effort, overseas France supplied many hundred thousand tons of raw materials and products of vital importance for the prosecution of the war. The empire supplied the Allies with (in short tons except where otherwise stated): rubber 23,432; cotton 70,755; oleaginous products 578,942; cocoa 124,925; coffee 113,588; gold 421; nickel 121,465; chrome 322,276; graphite 181,350; phosphates 826,725; diamonds 256,158 carats; and thousands of tons of various products, such as kapok, frozen meat, sisal, wax. honey, timber, gum, rice, vanilla, leather, etc.

French Union.-The war effort of the French empire

French celebration to welcome the British 1st army as it entered Tunis May 7, 1943

created rights to new political liberties. It thus compelled a revision of its institutions and the search for a new formula acceptable to all, which might facilitate as far as possible the development of the peoples overseas.

Thus was born the idea of a French union, an idea which took the place of that of the empire. The French union was an extremely flexible formula of association among countries whose ethnic composition, state of civilization and economic development differed. It excluded the concept of subjection or of a rigid system. It respected the existing degree of development of the different peoples, giving each without delay the maximum of liberty compatible with its development.

The French union comprised: (1) France; (2) Algeria, a natural extension of France², Guadaloupe, Martinique, Réunion and Guiana, old colonies raised to the status of French metropolitan départements by the statute of March 19, 1946; (3) the overseas territories of West Africa, Equatorial Africa, Madagascar, French Somaliland, French Oceania, New Caledonia, St. Pierre and Miquelon, French Indies, which henceforward had their representatives in the French parliament; (4) associated states having a separate existence under international law, in particular Morocco and Tunisia, and probably, as mentioned below, the various countries composing French Indo-China; these states would possess a wide administrative, financial and economic autonomy; they would be able to be represented in the French parliament if they so desired; the respective powers of France and of the associated states would

²Algeria, like France, is divided into départements. It has a governor general, assisted by a council of government (decree of Aug. 23, 1898). It is provided with a special budget (act of Dec. 20, 1900) and is represented in Parliament by 12 deputies.

‡Includes Tunisia.

be settled by a mutual agreement, ratified by the countries concerned; (5) the territories under mandate (Togoland, the Camerouns) already represented in the French parliament which would become protectorates administered by France, within the progressive framework laid down by the San Francisco charter in June 1945.

Government under mandate no longer applied to Syria and the Lebanon. Their independence was proclaimed on June 8, 1941. These countries became members of the United Nations in 1945.

The solutions, so contradictory in appearance, for the departments of the Antilles and for the democratic state of Viet-Nam, accorded recognition on March 6, 1946, marked the extreme limits of a policy which, far from sacrificing to some rigidly closed system, endeavoured to respect and encourage different types of civilization, legitimate local claims and favourable social conditions.

The final form this union was to take had not yet been fully determined in 1946. The reason for that lay in the complex nature of the problem. The French union was the most important question placed before the first and the second National Constituent assemblies. After a new and exhaustive discussion before its constitutional commission, the second assembly voted unanimously, on Sept. 20 and 21, the whole chapter viii defining the structure of the French union. As the second draft of the constitution was adopted by the national referendum on Oct. 13, 1946, it became an organic law of the republic.

The essential organs of the French union were the following: (1) the president of the republic is the president

of the French union and he represents the "permanent interests" of both; (2) the supreme council, presided over by the president of the union, and composed of a delegation of the French government and of the representatives of the associated states, "assists" the French government in the general leadership of the union; (3) the assembly of the union, composed half of the members representing metropolitan France and half of the members representing the overseas départements and territories and the associated states; an organic law would determine exactly how the members of the assembly would be appointed by different territories of the union; the assembly of the union would be consulted by the French parliament or government or by the governments of the associated states, on all legislative matters of interest to the overseas territories.

Since 1941 France's colonial policy had under-

gone a far-reaching transformation in spirit and methods. The new policy was first applied in Equatorial Africa. It found formal expression at the conference of Brazzaville (Jan. 30 to Feb. 6, 1944), where the methods which were to transform colonization were outlined. Later it brought about numerous reforms which all tended toward self-administration of the colonial territories by native "élites."

Various decrees concerning more particularly Madagascar, the Camerouns and Somaliland granted deliberative powers to the representative councils. In these councils the number of native delegates was made equal to that of French delegates.

A new and important step toward liberalism was taken on April 5, 1946, when the first national constituent assembly voted the electoral law applicable to the overseas territories. Henceforth these were entitled to one deputy for every 800,000 inhabitants and there would be only one single electoral college, embracing both citizens and noncitizens. This decision, which was far from being final, associated in a still more intimate manner the populations overseas with the decisions of the French parliament.

In French law there no longer existed "French subjects" and "natives," but solely "French citizens." In application of this essential principle the special tribunals for natives and the special penal code for natives were abrogated by decrees issued on the initiative of the minister of overseas France. Requisitioning of labour was forbidden, and the native became a free workman, freely discussing the conditions on which he undertook to work. A system of contract replaced one of constraint. Though the French union appeared rich in possibilities, it was also passing

through a grave crisis. Problems were intricate, obstacles far from being all overcome, and misunderstandings and strains were inevitable. The Indo-Chinese question, in particular, after a series of dramatic events, still caused many anxieties.

The Indo-Chinese Problem.-After the armistice of June 25, 1940, French Indo-China found itself at the mercy of Japan. The latter, after a series of ultimata, supported by its fleet and its army succeeded in occupying Indo-China in the course of the year 1941. Furthermore, Japan encouraged Siam to break the treaty of nonaggression signed with France in 1938 and to attack Indo-China. Under Japanese pressure a portion of Cambodia, the rice-producing provinces of Sisophon, Battambang and Siem-reap, were handed over to Siam, as were also those parts of Laos situated to the west of the river Mekong.

The subjection of French Indo-China by Japan was completed by March 9, 1945. That day the Japanese attacked the French troops at Hanoi, Lang-son and at other points. These troops had established contact with the French provisional government of Gen. de Gaulle, also with U.S. troops in the Philippines. They had revictualled the U.S. submarines, co-operated with the allied air forces based in the Philippines, China and India, and had in fact car-

ried on active military preparations against the Japanese. After several weeks' resistance about 3,000 Frenchmen succeeded in crossing into China; 2,200 Frenchmen were killed, of whom 400 were civilians and 1,800 soldiers; 756 French civilians were imprisoned by the Japanese police. Thousands of soldiers were taken prisoner. At the same time the French administration was eliminated and a puppet Annamese government set up at Hanoi by the Japanese.

†1945.

†1943.

§1937.

1941.

¶1944.

On Aug. 14, 1945, Japan surrendered unconditionally. Indo-China, divided into two zones by the 16th parallel, was provisionally occupied by Chinese troops on the one hand and by British on the other, whose mission was to disarm the Japanese forces. The loyal support the French received from the British saved numerous French lives. At Hanoi, under the pressure of the Annamese League.

for Independence with communist tendencies (the Viet-Minh), the puppet government established by the Japanese had fallen and been replaced by an insurrectionary government under the leadership of Dr. Ho Chi-Minh. This government had proclaimed the republic of Viet-Nam comprising Tongking and Annam in which they wished to include Cochin-China. But a French expeditionary corps under the command of Gen. Leclerc landed at Saigon and, in a campaign lasting several months, reoccupied Cochin-China. He then made preparations for a landing at Haiphong to occupy Tongking as well.

91**939.**

Meanwhile the French and the Chinese governments were conducting negotiations which resulted on Feb. 28, 1946, in two Franco-Chinese agreements. These provided, in particular, for the evacuation by Chinese troops of

northern Indo-China and their replacement by French troops. At the same time the high commissioner for France in Indo-China, Adm. Thierry d'Argenlieu, was negotiating with the Viet-Minh, with the approval of the French government, and these negotiations resulted in the agreement of March 6, 1946, by which military reconquest was replaced by a settlement between France and the Annamese. This agreement embodied the following principles: (1) the French government recognized the republic of Viet-Nam as a free state, having its government, parliament, army and finances, forming part of the Indo-Chinese federation and of the French union. So far as the reunion of the three "Ky" was concerned, the French government

undertook to ratify the decisions taken by the population when consulted by referendum. (2) The government of Viet-Nam declared itself ready to extend a friendly welcome to the French army when, in accordance with international agreements, it arrived to relieve the Chinese troops. A supplementary agreement, attached to the existing preliminary convention, was to fix the terms under which the relieving operations would be carried out. (3) The stipulations set forth above were to come into force as soon as signatures had been exchanged. Each of the contracting parties was to take all necessary measures to bring hostilities to an end at once, hold the troops in their respective positions and create an atmosphere favourable to the immediate opening of frank and cordial relations. These negotiations would deal especially with the diplo-

³Ky—Annamite expression signifying country. e.g., Bac-Ky—country of the north (Tonking); Trung Ky—country of the middle (Annam); Nam Ky—country of the south (Cochin-China).

matic relations between Viet-Nam and foreign states, the future statute for Indo-China and economic and cultural interests. Hanoi, Saigon and Paris were to be considered as likely seats for the conference.

By virtue of this agreement, the French army landed troops the same day at Haiphong and in 1946 were occupying Hanoi, Lang-son and other strategic centres. Negotiations begun at Dalat were pursued at Fontainebleau, as provided for under clause (3). The most delicate question was that which referred to the future statute for Cochin-China, which in 1946 was outside the authority of the Viet-Nam government.

The Franco-Viet-Namese conference of Fontainebleau was temporarily interrupted, but a modus vivendi was signed on Sept. 14, 1946, between France and Viet-Nam. It provided for a limited agreement which entered into force on Oct. 30, 1946, and announced in its preamble a resumption of Franco-Viet-Namese preliminary discussions for Jan. 1947. Its ten articles dealt respectively with the following: (1) the liberties granted to Viet-Namese nationals in France and to French citizens in Viet-Nam; (2) the restitution to Frenchmen of their property in Indo-China; (3) the restoration of French teaching in Viet-Nam; (4) the preference given to Frenchmen for posts as counsellors, technicians and experts; (5) the maintenance of the Indo-Chinese piastre as sole currency throughout the whole of Indo-China; (6) the Indo-Chinese customs union; (7) the co-ordination and improvement of communications; (8) the establishment of Viet-Namese consulates in the bordering foreign countries; (9) the cessation of all hostile acts between France and Viet-Nam through agreements reached between the general staffs; the liberation of prisoners and the suppression of "unfriendly propaganda"; (10) the conclusion of special agreements with a view to preparing the way for a final and all-inclusive treaty.

However, political tension mounted steadily after September and by late December, major fighting had broken out between Annamites and French troops at Hanoi and elsewhere. Negotiations scheduled for Jan. 1947 were postponed pending the restoration of "order." (See also Lebanon; Pacific Islands, French; Syria.) (M. Mt.)

French Possessions in America.—The four colonies of France in the western hemisphere fall into three regional groups: (1) the small islands of St. Pierre and Miquelon, about 10 mi. south of Newfoundland at the mouth of the Gulf of St. Lawrence; each has certain dependent islets. The area of the St. Pierre group is 10 sq.mi. and that of the Miquelon group 83 sq.mi.; the pop. of both was estimated at about 4,175 in 1946. (2) The French West Indies, consisting of the two colonies of Martinique and Guadeloupe, the latter with five small island dependencies: La Désirade, Marie Galante, Les Saintes (including seven small islands), St. Martin (part of this island owned by the Netherlands), and St. Barthélémy. All these islands are in the Lesser Antilles. The only large islands in the group are Martinique (area, 427 sq.mi.; pop., 260,000) and the twin islands of Guadeloupe, in-

cluding Basse-Terre or Guadeloupe proper (area 687 sq. mi.) and Grande-Terre (area, 364 sq.mi.); the pop. of Guadeloupe and dependencies was estimated at 310,000 in 1946. (3) French Guiana, a South American mainland colony in the northeastern part of the continent, including French Guiana proper, a narrow coastal strip with an area of about 3,500 sq.mi., and the large hinterland organized as the dependency of Inini; the area of the whole is 35,126 sq.mi. and the pop. about 37,000 in 1946. There are no large cities in these colonies. The only important town on St. Pierre is the capital of the same name. The largest cities or Martinique (with 1936 census pop.) are Fort-de-France (5°,051), Trinité (39,173), St. Esprit (33,804) and Marin (31,369). The largest cities on Guadeloupe (with 1938 pop. est.) are Pointe-à-Pitre (44,-551), Ste. Anne (1931 est., 15,269), Basse Terre (13,638), Le Moule (1931 est., 17,159), Grand Bourg (on Marie Galante, 12,827) and Capesterre (1931 est., 11,537). The only important city in French Guiana is the coastal capital Cayenne (pop., 11,704). Racial composition of the colonies varies considerably. That of St. Pierre and Miquelon is largely French or of French descent. The population of the French West Indies is almost entirely Negro or mulatto; less than 2% of the total is white; the Saintes islands are inhabited by descendants of Norman and Breton sailors. The population of French Guiana is largely Negro, some of those inhabitants being bush Negroes or Djukas. The language of all of the colonies is French, except that many of the West Indian natives use a dialect known as Creole, and some of the Guianan Negroes speak a bastard English which incorporates many Indian, African, Dutch and Portuguese words. Governmental organization varies considerably. St. Pierre and Miquelon were ruled by a governor appointed from France; they were under control of the Vichy regime in 1941-42. Martinique and Guadeloupe were organized and governed as departments of France, with representatives in the French senate and chamber of deputies and local services organized as in France. In Jan. 1947 the administration of the islands came under the French ministry of the interior and the governors were replaced by prefects. French Guiana was, until 1940, administered by an appointed governor assisted by certain representative agencies; the latter were almost completely suppressed. The territory of Inini was governed directly by the governor of French Guiana.

St. Pierre and Miquelon, which traditionally had depended almost entirely on the fishing industry, experienced, with few exceptions during the decade, a placid development. The nature of the islands' economy was responsible for less disruption caused by the impact of the war in 1939 than was true in many colonies, the chief difference being the inability of the traditionally large numbers of French fishermen to go to the islands for the summer fishing season. Throughout 1941 the Vichy-appointed governor of St. Pierre and Miquelon was harassed by intermittent undercover Free French agitation. A Free French armed vessel, however, seized St. Pierre on the night of Dec. 24, 1941, hoping to establish a Free French territorial nucleus in that area. A local plebiscite showed an overwhelming Free French sentiment, and the move brought widespread popular sympathy in the United States and Canada, but the U.S. government swiftly condemned it as a violation of agreements with the Vichy regime and presented a formal demand for restoration of the status quo ante. A modus vivendi was subsequently arranged under which Vichy control was restored, with, however, a

close supervision of the St. Pierre radio station, established under the Vichy government, the weather reports of which were thought to be of aid to the axis. All importation of arms and munitions into St. Pierre and Miquelon was forbidden in 1942 as a consequence of the attempted coup of late 1941. The administration in 1943 established a council of fisheries to replace a former consultative commission. It also ordered on April 29 an embargo on the export of postage stamps. Regulations of the Vichy government were voided in the northern islands in the latter part of 1944 and the colony reverted to laws of the republic.

The French West Indies, being of greater stretegic importance and larger population and economic interests, reflected the impact of World War II to a greater degree than did the northern islands. The main islands of Martinique and Guadeloupe (and to a smaller extent the Saintes, with an excellent naval harbour) were the focus of much attention after the collapse of France in 1940 and the subsequent rapprochement of the Vichy regime with nazi Germany. The second foreign ministers' conference of the American republics, held at Havana, Cuba, in July 1940, was concerned primarily with the possible fate of the European possessions in the West Indies and more especially with Martinique which, it was feared, might become with Vichy connivance a clandestine outfitting and supplying centre for submarine warfare in the Caribbean. Martinique was also of interest because of the storage there of large amounts of French gold and the internment at the island of an important aeroplane carrier and numbers of planes. French naval units were kept under close surveillance by U.S. naval and air patrols. Both Martinique and Guadeloupe remained under semiblockade, with most of their external trade confined to the United States. On several occasions during 1941, as the Vichy regime seemed to turn more toward the axis, official and semiofficial statements were made in the United States regarding possible U.S. occupation of Martinique.

Fears that Martinique might become an axis base against the Americas were heightened after formal entry of the United States into World War II. It was officially announced at Washington on Dec. 18, 1941, however, that an accord had been reached with Adm. Georges Robert, high commissioner for the four French colonies in the western hemisphere. The agreement, it was understood, provided for continued trade with the United States in return for pledges that neither French vessels nor nationals would take any action detrimental to the United States. The Vichy government, however, denied any change in the status of the French American colonies. The United States began negotiations with Adm. Robert in May 1942 with the objective of permanently eliminating a weak spot in the U.S. Caribbean defense line. Conversations continued throughout the summer and until after the invasion of North Africa by the Allies, after which Adm. Robert began acting independently of the Pierre Laval government in Vichy. The negotiations resulted in the immobilization of French war vessels at Martinique by the storage of vital parts in the U.S. consulate and the removal of the ships' fuel oil, in return for which the United States guaranteed the neutrality of the French West Indies. The United States continued shipment of nonmilitary supplies to the islands so that they would not suffer from lack of necessities. The local administration apparently remained at least officially loyal to the Vichy regime, however, and broadcasts were reported late in 1942 to be unfriendly to the United Nations. The negotiations were unsuccessful in gaining the release for Allied use of the 140,000 tons of French merchant shipping and tankers tied up at Martinique. During the summer of 1942, 300 Martinique French escaped to join the Free French forces. Refusal of the insular administration to sever its ties with Vichy France and to co-operate as fully as was desired with the American republics led the United States in Nov. 1942 to break off diplomatic and commercial relations with the islands. The result was that for some time thereafter no vessels arrived with supplies.

Adm. Robert, continuing loyal to the Vichy government, held out in Martinique until June 29, 1943, when he requested that U.S. agents be sent to discuss a transfer of authority. After a conserence, Henri-Etienne Hoppenot was named high commissioner of the Antilles by the French committee of national liberation. Adm. Robert resigned as governor on July 13 and by August was on his way to Vichy. The United States then resumed shipments of supplies to the islands, with resulting improvement in conditions, but strict control over profits was retained, and the sale of autos, tires and tubes was carefully rationed. Circumstances continued to improve in the West Indian islands in 1944 but were still far below the normal level of prosperity. Political conditions were quiet after transfer of control to the committee of national liberation. Gov. Hoppenot was transferred from Martinique to another post early in 1944 and was succeeded by Antoine Angelini as acting governor until the appointment of Georges Parisot as governor, made by Gen. de Gaulle in 1944; Parisot did not assume office, however, until Jan. 1945.

The French government made great efforts during the year to restore some part of the commercial activities of its American possessions, especially the West Indian islands. It adopted strict regulations to govern the importation, exportation and distribution of products; persons engaged in foreign trade were organized into import and export groups, with commissions established to direct their activities. A decree of June 2, 1944, created an autonomous exchange control office in each colony. The Paris government on July 28 ordered the requisitioning of all holdings of U.S. dollars which citizens possessed, for deposit in the exchange stabilization fund. Accounts in the United States were transferred to the credit of the particular colony in which the former holder had resided; the exchange rate for the transfer of such funds was at the rate of 50 francs to the dollar. All imports were then governed by the dollar exchange available, and were allocated on the basis of a division of goods into nine categories, such as food, clothing, hardware, industrial machinery, etc. Imported goods could be sold only to retail merchants. Martinique had \$3,000,000 worth of orders in the United States on Oct. 1, 1944, awaiting exchange credits. The general council in Guadeloupe authorized a loan in Nov. 1944 to support an extensive program of public works, begun in 1931 but later suspended. The revised program, work on which was resumed in 1944, called for an expenditure of 240,000,000 francs, and included modernization of the port of Pointeà-Pitre, reclamation of 450,000 sq.m. of flood lands and construction or repair of public buildings, roads and bridges and electric power lines.

The food supply of the Caribbean colonies, which had begun improving after the lifting of the blockade in 1943, continued to enlarge in 1944; some items, such as bread, were removed from rationing. The meat shortage was acute in the summer of 1944, but the supply increased later. The limited amounts of consumer goods resulted in a flourishing black market, however. Newsprint was rationed

in Aug. 1944. Economic conditions in Martinique improved slightly in the early part of 1945 but continued to be affected by a greatly reduced production of sugar cane, the major crop, caused by shortages of equipment and fertilizer. Considerable labour unrest prevailed in Martinique, and the sugar cane grinding season was delayed by wage controversies until the governor decreed a 25% wage increase in March 1945. Two other measures were designed to reduce import prices; one temporarily suspended tariff duties on certain basic food items, and the other cut profit margins for merchants. Guadeloupe, with a more diversified agriculture than Martinique, was in a better position with regard to foodstuffs. French and insular officials gave consideration late in 1945 to a new loan of 200,000,000 francs for a public works program for Martinique.

French Guiana, which had the reputation of being the most poorly developed European colony in the new world, suffered relatively less from the early impact of the war than did the French West Indies. The colony allegedly served in 1941 as a channel for entrance of axis agents into South America. French Guiana suffered less from the vicissitudes which affected the Caribbean colonies as a result of Allied pressure on the Vichy-dominated insular administrations. A bloodless coup on March 16, 1943, led by army officers but supported by the inhabitants, resulted in the overthrow of the established authorities and adherence to the Free French cause. Jean Rapenne was appointed governor of the colony. U.S. and Brazilian military observers arrived at Cayenne at the end of March 1943; much needed supplies soon followed, with a consequent improvement in living conditions. French Guiana was authorized in 1944 to borrow 1,200,000 francs for improvement of port and transportation facilities.

The notorious Devil's Island penal colony was subject to changeable decisions during the decade. The French government had earlier decided that the various penal settlements in French Guiana should all be liquidated within the 15 years following 1936. Crowded conditions in French prisons led in 1938, however, to the deportation of additional prisoners to French Guiana; the colony by 1943 had a convict population of 2,404. The French committee of national liberation decided on March 6, 1944, to reestablish Devil's Island as a prison for those convicted of political crimes, but later in the same year the government

Annamite rebels in the custody of British and French troops in Saigon during the Indo-Chinese insurrection which began in Sept. 1945. Nationalists fought the return of French colonial rule

resolved to abandon the penal settlements; gradual liquidation subsequently began.

In the latter stages of World War II, after Vichy control was removed in the French colonies, the French West Indies and French Guiana were brought into closer relationship with British, Dutch and U.S. possessions in the area with regard to their mutual economic and other problems. Representatives of the Middle American French colonies participated in a Caribbean conference at St. Thomas in the U.S. Virgin Islands, beginning Feb. 21, 1946.

Because of his ill health, the French government on March 14, 1946, released from custody Adm. Georges Robert, erstwhile governor of the French West Indies, who had been held at Paris on charges of collaboration.

French Literature

A characteristic shift in the choice of subject-matter seems to have been the most noteworthy development in French literature during the ten-year period 1937-46. This choice, which did not always result from a deep-felt inspiration, was concerned with the theme of actuality. The poets descended from their ivory towers, the prose writers discovered a reality whose presence they had neglected; and all discovered a mission in the immediate present. The importance, if not the sense, of the actual, already present to a considerable extent in the years preceding World War II, became under the German occupation a personal concern for the majority of writers. The relatively active participation of numerous writers in the Resistance movement had the effect of accentuating adherence to the actual, and brought forth a persistent desire to include reality with poetic dignity. But this "turning toward the real" did not result in epic literature in which the universal vision of the drama of man would be expressed.

Many poets who exclaimed "Our ravaged country," "France betrayed," followed their conception of civic duty rather than a true poetic fervour.

The introduction of the actual into literature resulted inevitably in a relaxation of form in the work. A poet such as Loys Masson, exquisitely sensitive to the enchantment of the tropical forest and to the winds whistling through the masts of sailing vessels, wrote bad verse during the occupation. Louis Aragon, who in his youth had written books which seemed to presage an inspired writer, published, under various pseudonyms, poems which did not entirely excuse the romantic provincial yearning for the cathedral of Strasbourg.

This "taking a stand" which for several years preceded the "literature of participation" of the existentialists, nevertheless inspired certain poets to high poetic achievements. The metaphysical anxiety about the destiny of man, his ultimate end, his attitude in the crisis of a civilization, his relationship with God and with evil—the latter too often confused with the invader, with the German as such—all this was expressed by poets like Pierre Jean

Jouve, Pierre Emmanuel and Michel Leiris with great lyrical force. Through his hopes on behalf of humiliated France, Pierre Jean Jouve showed, in Ode au Peuple and in Chevaliers d'Apocalypse a greater preoccupation with the tragic sense of destiny. In Sueur et Sang, Pierre Emmanuel, inspired more by the epic form and employing a broad rhythmic style, produced mighty works — "Jour de Colère," "Combattre avec les Défenseurs, "Tombeau d'Orphée." A neo-Thomist and ideological disciple of Jacques Maritain, he saw in mediaeval Christianity a type of universal society which he differentiated not only from collectivism but also from acrimonious individualism. On a different plane, more sensual, perhaps more sorrowful and preyed upon by cruel visions, Michel Leiris decried in Haut Mal, the evil of living, the uselessness of effort and struggle and the nostalgia of withdrawing into one's self and vanishing into prehuman nothingness.

With Mots Croisés, published in 1939, Aragon entered decidedly into what the critics were pleased to call his neoclassicism. Cantique à Elsa, Les Yeux d'Elsa, Crève-Coeur, Diane Française and Servitude et Grandeur des Français (the last title taken from Georges Clémenceau) were so many pages which, with rhymes often too audacious to be classic, corresponded to an imagery willfully despoiled, entirely at the service of a theme which became more and more nationalistic and vainglorious. The novel Aurelien, which followed Les Cloches de Bâle and Beaux Quartiers, completed a trilogy with the action taking place in the Paris of 1922.

Simone de Beauvoir, a disciple and associate of Jean Paul Sartre, unknown before World War II, published a type of manual of existentialism, Pyrrhus et Cinéas, a novel, Le Sang des Autres, and a play based on the latter, Les Bouches Inutiles.

Julien Benda, unceasing defender of Cartesian rationalism and of an intellectualism free of irrational sin, had previously published two biographies, La Jeunesse d'un Clerc in 1937, and Un Régulier dans le Siècle. In 1946 his Exercise d'un Enterré Vivant appeared, in which he described his own driving force as a hunger for logical thought. In La France Byzantine (1945), the author declared war on the irrationalism of the art and the "humanitarianism" of André Gide, Paul Valéry, Jean Giraudoux and Marcel Proust.

Georges Bernanos wrote Sous le Soleil de Satan and Les Grands Cimetières sous la Lune (1938); in the latter work he lived up to his reputation as polemical writer. As a Catholic, he used all the heat and anger of his sarcasm in calling to account the "well-meaning" and reproaching them for confusing their social privileges with the teaching of Christ. In his Lettre aux Anglais as well as in his essays published under the title of Nous autres Français (1945) he proved his broadmindedness which permitted him to conclude that the French crisis was inseparable from the crisis of universal conscience.

André Breton, leader of the Surrealist movement, and refugee in the United States from 1941 to 1945, published the de luxe magazine VVV, whose appearance recalled the former Minotaure. Breton also produced a long poem entitled Arcane 17, written in the purest tradition of the school, weaving together imagination and reality. The theme was love and flight from the actual as a refuge from sorrow.

A newcomer in French literature, Albert Camus, was considered a discovery of the decade 1937-46. In his play, *Malentendu*, written in a style and manner which betrayed a solicitude for classicism, he used the theme of

Electra. Another play, Caligula, portrayed a dictator lost in madness. Le Mythe de Sisyphe attempted in essay form to demonstrate the absurdity of human existence caused by the irreparable contradiction between the desires and the will of man on the one hand, and, on the other, the reality of a world which definitely does not take into account man and his desires. In L'Etranger, a short novel with startling laconic language, Camus tried to illustrate this thesis. But the hero does not in reality enjoy a personal existence; he lives by some sort of proxy. He permits himself to be loved, to be hated, and even to be condemned to death without any reaction on his part.

* *

THE POWERFUL personality of Paul Claudel continued to assert itself during the decade. Claudel's Jeanne d'Arc au Bûcher was produced in Paris in 1939 with a musical background written by Arthur Honegger. During 1941 and 1942, he published in Switzerland Présence et Prophétie, which he had announced as a kind of introduction to apocalyptic "verticalism." Louis Jouvet and his company produced his Annonce faite à Marie during a long tour in Latin America. In spite of his occasional exuberance and abuse of metaphors, Claudel remained the great epic poet of grace, revelation and redemption. His style is broad, full, generous, and rich in deep resonance.

An inquiring imagination, with a taste for jugglery, for the absurd taken seriously and for the serious concealed in a scintillating phrase—these were all the qualities of Jean Cocteau, as in *L'Incendie* (1939), a poem of love set in pre-Munich Paris.

Georges Duhamel, author of Chronique des Pasquier, added regularly to his already large output Le Désert de Bièvres and Les Maîtres (1937), Cécile parmi Nous (1938). In 1941, the Germans banned his Lieux d'Asile. The year 1945 saw the publication of his essays, Inventaires de l'Abîme. Duhamel remained faithful to himself throughout the years, conscientious, sober, unostentatious—identical in his writings with the grayish silhouette of his Salavin.

One of the most gifted and most authentic poets of the period was Paul Eluard, who avoided the Resistance poets' decline into easy sentimentalism. Although he wrote numerous poems during the occupation, he did not sacrifice his art to the needs of the cause. Chanson Complète (1939) seemed to be a milestone in his work, since it marked his estrangement from the Surrealist school and a return to a vocabulary deprived of artifice. Un Seul Nom (1942), Dignes de Vivre (1945), Paris Respirait Encore (1944) and Au Rendez-vous des Allemands (1946) all bore testimony to his lively sensibility, awakened by the magic of the immediate present and the simple. Eluard spoke the language of the street and the field and of the humble desire to be happy.

Léon Paul Fargue, author of Le Piéton de Paris (1939) was the lovesong writer extraordinary of the City of Light, wandering around the streets of Paris, concealing his real tenderness with a sort of sneering exterior. None wrote better than he of railroad stations, crossroads, street lights in the evening, and good-byes at the wharf.

In 1937, La Pléiade (under the direction of Jacques Schiffrin) published André Gide's Journal, which became the literary event of the year. Covering half a century, the Journal contributed appreciably to the inheritance of French literature. It abounds in pertinent analyses and contains an extended biographical index—a boon to future biographers. A second volume of the Journal was added in 1944, including the years 1939—42. In 1943, the volume of his Interviews Imaginaires appeared in Algiers

after prior publication in the columns of Figaro. In 1945 in rapid succession appeared Vie de Thésée and a play Robert ou l'Intérêt Général, in which the characters of his School for Women reappeared. The Théatre Français produced his translation of William Shakespeare's Anthony and Cleopatra, and Jean Louis Barrault created Hamlet in Gide's translation. The author of l'Immoraliste was attacked by a number of communist writers after their conversion to extreme and aggressive nationalism. His attitude, however, was above criticism. In spite of a démarche by Paul Valéry, he refused to lend his name to the Nouvelle Revue Française whose direction had passed back into the hands of Jean Paulhan. During a lecture which he was asked to deliver in Nice about Henri Michaux and which was first banned but then finally authorized by the Vichy legion, he made substantially the following declaration: "I intended to entertain you with a nonpolitical subject-a poet and his work. The legion has graciously authorized me to do so. But since I am not accustomed to speak upon permission only, I ask your favour to permit me to retire. . ." In spite of his great age, André Gide remained the most representative figure of contemporary French literature, and his influence was certain to endure.

The magician of literature, Jean Giraudoux, died in 1944. His posthumous play La Folle de Chaillot was produced by Louis Jouvet, upon the latter's return to France in 1945. In 1938 his Choix des Elues appeared, and in 1943, in Switzerland, his Sodome et Gomorrhe. Giraudoux' work was of a light and graceful architecture, although without foundations.

Max Jacob, who died in prison, exercised a lasting influence upon an entire generation of poets. A master of language, he adapted his style to the inspiration of the hour (Le Laboratoire Central, Chants Bretons, Fond de l'Eau), full of resonance, often burlesque and always moving.

Francis Jammes, of whom André Gide had said that he was blessed by the good Lord, died in 1938 at the age of 70. He was a poet who deliberately chose to be naive, who liked simplicity, knowing how to make his writings simple; he favoured bucolic charm (De Tout Temps à Jamais, Le Pèlerin de Lourdes, La Vierge et les Sonnets, Le Deuil des Primevères).

In an interview granted Labyrinthe (a Geneva paper) André Malraux said that he believed in the formation of a new culture; a culture of the Atlantic (as opposed to the culture of the Mediterranean). Throughout his two novels L'Espoir (1937) and La Lutte avec l'Ange (1943), the author of Voie Royale appeared to have met a metaphysical spectre. "Like the God of Nietzsche, is man dead?" he asks himself. But the myth of the hero, all present in his works, did not disappear from his later preoccupations; nor did the justification of man and the will of liberty.

Jacques Maritain, the greatest theorist and leader of the Neo-Thomist school, spent the war years in the United States. In numerous writings, notably in *Crépuscule de la Civilisation* (1941), he opposed the modern world and its individualistic and practical ethics with a norm of spiritual values. The evil which contemporary man suffered was of a purely intellectual order. Pretended reason and rationalism were the basis of atheistic humanism and of racial antihumanism; they constituted the factors of decadence and found themselves at the very source of social convulsions beginning with the Renaissance and the Reformation. The complete abandonment of individualistic ethics and a return to certitudes, according to Maritain, were the only means of saving humanity and its culture from the corruption of a "pagan empire." These considerations were

taken up by Rev. Henri de Lubac in his Le Drame de l'Humanisme Athée (1945).

François Mauriac belonged to this same school of thought; his entire work revealed one essential preoccupation—the fusion of spirit and flesh. Les Mal Aimés (1945), Les Chemins de la Mer (1939) and Asmodée (1938) were plays and novels expressing this idea. Two of his books were printed in 1945: Sainte Marguerite de Cortone and Le Bâillon Dénoué. His work remained honest and discreet, but without inner radiance.

Henri Michaux revealed himself as one of the most personal and original poets of the decade. Epreuves-Exorcismes and Plume, preceded by Lointain Intérieur and Un Barbare en Asie, were of a surprising and enchanting quality; their unique theme was the search for man and the reason why man is tragic.

Along with Pierre Emmanuel, Patrice de la Tour du Pin took an important place among the young generation of Catholic poets. Inspired directly by Charles Péguy, Du Pin occasionally fell into a monotony and a heaviness caused by overemotionalism. But all through his work—La Vie Récluse in Poésie (1938) and Les Psaumes (1939), to which he added, in order to complete his Summa, La Quête de Joie, l'Enfer, Le Lucenaire etc.—his great epic inspiration dispelled hesitation and overcame abstractness. This young poet in his contemplative and mystic fashion and through esoteric symbolism achieved youthful grace and vigour.

An understanding for finesses and a keen sense of the written word were proper attributes of Jean Paulhan. He was a "discoverer of poets"; while the Nouvelle Revue Française was under his direction, and before it became a collaborationist paper, he collected on his pages the poems of Jules Supervielle, Audiberti, Patrice de la Tour du Pin, Pierre Emmanuel, Henri Thomas. His Fleurs de Tarbes and Clefs de la Poésie were works of analysis and synthesis, which attacked the difficult problem of language and its relationship to thought in poetry. He, better than anyone, analyzed the structure of the commonplace. For the poet, he declared, words and thoughts are absolutely interchangeable.

The father of *Unanimisme*, Jules Romains was elected to the French academy in 1946, after he had spent the war years in Mexico; there he completed his monumental writing *Hommes de Bonne Volonté*, comprising more than 20 volumes. His latest works might be called intelligent and solidly constructed, but lacking true emotions and without even the rustic elegance of the artisan; they were quite inferior to the creations of his younger days: *Copains*, *Bourg Régénéré*, *Comedeyre-le-Vieil*. In 1940 he published *Les Sept Mystères du Destin de l'Europe*, an expression of his fruitless efforts to save the world from catastrophe.

* * *

Among Newcomers in the literary field of the World War II period, Jean Paul Sartre acquired a singular notoriety. Although the author of a volume of short stories, Le Mur, and a novel, La Nausée, he was almost unknown until 1939. But then, as the leader of the school of Existentialism, he gained the spotlight not only because of his numerous publications which followed each other almost uninterruptedly, but also because of his dynamic personality. His two plays, Les Mouches and Huis Clos had their first performances in Paris in 1944. In a series of three volumes, announced under the title Les Chemins de la Liberté, two appeared—L'Age de la Raison and Sursis. L'Etre et le Néant, an enormous philosophical work, became the

bible of the existentialists. In 1946, two other plays were produced, La Putain Respectueuse, based on racial discrimination in the United States, and Morts sans Sépulture with the action centring around the Resistance movement. Tracing its origins back to Sören Aabye Kierkegaard as well as to Martin Heidegger, Karl Jaspers and Léon Chestov, the Existentialist school laid down the axiom that liberty is an attribute of man; that every person is responsible for everything, and that all life is "engaged." Adversaries of the school criticized it for its vagueness—"engaged" in what manner? What was the aim? What values were to be served? A brilliant mind, inventive and gifted with intellectual speculation, Sartre became a true writer of ideas.

Paul Valéry, who died in 1945, was almost unanimously considered the greatest French poet of the period. He formed his rhythms, tuned his songs and created images without comparison. Every word, harmony or assonance in his poetic work was painstakingly and conscientiously balanced. The end he pursued seemed to be the pursuit itself, to an extent that he rejected any expression whose significance and justification might be somewhere else than in its proper measure. His work combined an "avid and disabused" intellect together with the supreme understanding of the word and its extensions.

The poet of popular imagination, St. Pol-Roux, died in 1940. His last work, La Supplique du Christ, took up the defense of the Jews against the race beaters; this was in 1939. In the United States, St. John Perse published strange and surging poems: Exil, Pluies, Anabase, telling the deluded experience of an officious and vain world. Jules Supervielle, who spent the war years in Latin America, wrote poems of an imaginary mythological world. Jean Schlumberger, author of Stéphane le Glorieux, received the grand prize of the French academy for his entire work. André Maurois tranquilly pursued a literary career—the results of which, however, did not compare with his previous works. Denis de Rougemont published La Part du Diable in the United States. Jean Cassou, author of Légion and translator of Cervantes, contributed Trente-trois Sonnets écrits au Secret. Jean Genêt, who was discovered by Cocteau, published a biographical narrative, Le Journal du Voleur (1946), a collection of obscenity and narcissism in the ignoble, which, nevertheless, was of true literary temperament. Péguy, a posthumous work by Romain Rolland, appeared in two volumes (1945). Maurice Blanchot showed himself to be a talented young critic. Le Monde Concentrationnaire by David Rousset, who had been deported as a political prisoner, won the prize of Théophraste Renaudot. Paul Nizan, author of La Conspiration, which won the Interallied prize in 1939, was killed in World War II. Aimé César, a poet from Martinique, contributed in the Tropiques and Les Armes Miraculeuses pages of colour and exuberant language. Robert Desnos, who died in captivity, published his poems under the pseudonym of Valentin Guillois. The great revolutionary poet, Marcel Martinet, author of Les Temps Maudits, Chants du Passager and La Nuit, died during the occupation and left a posthumous novel, Le Solitaire, which was published in 1946. René Char's Seuls Demeurent and Feuilles d'Hypnos as well as Jacques Audiberti's Des Tonnes de Semence were poems of originality.

A fairly important number of writers found themselves cut off from French literary life because of their crime of "collaboration." With the exception of Jean Giono, Henri de Montherlant, and Céline, they belonged to the class of "minor" writers. There were members of the academy,

such as Charles Maurras, Abel Bonnard, André Chaumiex, Louis Madelin and Henri Bordeaux. There were also Roger Allard, the author of Elégies Martiales, and Henri Massis. The slogan "back to the soil," so dear to the paternalism of the Vichy regime, found its standard bearer in Henri Pourrat, who received the Prix Goncourt of 1941 for a piece of writing which was in the nature of a sermon about peasants. Jean Giono, mighty and authentic poet of the soil, was the prophet of a neopaganism pleasing to nazi ideology. Drieu la Rochelle, who committed suicide, Chardonne, Jouhandeau and Ramon Fernandez, who switched successively from communism to royalism, and then to naziism, were all associated with an Academy of Great European Writers, founded at the Congress of Writers of Greater Germany. Henri de Montherlant took part in these activities, although he denounced the kind of literature which became the taste of the day. Robert Brasillach was condemned to death and executed although he was one of the least compromised. Maxence van der Meersch, Cousteau, Pierre Gaxotte, Henri Béraud were all writers with extremist tendencies writing in the Gringoire, Je Suis Partout and Au Pilori, which were known for their inflammatory character and their unreserved subservience to Germany. Claude Farrère attempted to prove in a book called Onzième Heure that Japan was saving civilization in (J. MAL.)

Freyberg, Sir Bernard Cyril

Sir Bernard Freyberg (1890—), British army officer, was born in London and went to New Zealand when he was a child of two. He was educated at Wellington college and set up practice as a dentist. Irritated with the monotony of his existence, he went to Mexico during the revolution in 1913. Some sources asserted that Freyberg was an officer in Francisco ("Pancho") Villa's army; others report that he fought against Villa.

Back in Europe at the outbreak of World War I in 1914, he was soon commissioned as a lieutenant in the army. He fought with the British expeditionary force in Belgium and later was transferred to Gallipolli, where he won the distinguished service order.

He subsequently returned to the western front, where he led his men in an attack on Betancourt, although he himself was suffering from heavy wounds. For this achievement, he received the Victoria cross. During World War I he was wounded nine times in all, and was mentioned six times in dispatches. On his promotion in 1917 to a brigadier, Freyberg at 28 became the youngest general in the British army.

At the start of World War II in Sept. 1939 Freyberg was commander of the Salisbury plain area. The following Dec. he was appointed general officer in command of the New Zealand army corps and in 1941 he fought in Greece and Libya and was commander in chief of Allied forces on Crete. Lt. Gen. Freyberg also participated in the North African and Italian campaigns and accepted the surrender of German forces at Trieste in May 1945. Sir Bernard, who was knighted in 1942, was also wounded several times in World War II. It was announced Sept. 4, 1945, that Sir Bernard had been appointed governor general of New Zealand; he assumed his new post in early 1946.

Frick, Wilhelm

Frick (1877-1946), German politician, was born March 12, 1877, in the Palatinate and was a student of the Universities of Munich, Goettingen and Berlin. His affiliations with the nazi party started at the time of the Munich beer-hall putsch in 1923 (he was implicated in the uprising) at which time he was attached to the Munich Police presidency. He later became minister of the interior and minister of public instruction in Thuringia. During this time, Frick sought to make the Thuringian police an armed force for the nazis. When Hitler assumed the chancellorship of Germany in 1933, he brought Frick to Berlin as his minister of interior. In that capacity, Frick ruthlessly suppressed opposition parties, trade unions, the press and the Jews. He was captured by the U.S. 7th army on May 7, 1945, near Munich and was brought to trial as a war criminal at Nuernberg. On Oct. 1, 1946, the International Military tribunal found him guilty of crimes against the peace, war crimes and crimes against humanity and sentenced him to death by hanging. He was executed at Nuernberg on Oct. 16, 1946.

Friends, Religious Society of

In 1946 the Religious Society of Friends (Quakers) was approaching the 300th anniversary of its founding. The society grew out of a spiritual movement originating around the year 1650 in England under the leadership of George Fox. Its central doctrine has always been the Inner Light or Divine Seed in each individual, revealing that which is evil, empowering men to do the good, and uniting individuals with one another and with God, the source of life and light. The society was composed in 1946 of 53 constituent yearly meetings and annual conference groups in all parts of the world. Membership grew from slightly less than 160,000 in 1937 to approximately 164,000 in 1946 (these figures were necessarily based on estimates).

The two major trends in the period from 1937 to 1946 were (1) a tendency toward unity and a growing sense of world community, and (2) developments growing out of the application of the traditional Quaker peace testimony in a world preoccupied with war.

* * *

FEELING the need to implement and strengthen their sense of solidarity in a world rapidly dividing on national and racial lines, Friends held in 1937 at Swarthmore and Haverford colleges in Pennsylvania, a Friends World conference attended by 985 official delegates representing 24 nations. Commissions deliberated and presented reports on the spiritual message of Friends, the individual Christian and the state, methods of achieving economic, racial and international justice, the Quaker contribution to education, and international co-operation among Friends. Out

of this conference emerged the Friends World Committee for Consultation with headquarters in London, functioning through a European, a U.S. and a far eastern and African section (the latter not yet officially constituted in 1946). Owing to the war, full meetings of the committee were held only in 1938 at Vallekilde, Denmark, and in 1939 at Geneva, Switzerland. Regional conferences were held during the war in the United States and Great Britain to discuss subjects such as the spiritual service of Friends in Europe, the orient and the Caribbean. The World committee also promoted intervisitation among Quaker groups in different countries where war conditions allowed, and undertook a program of publications to promote mutual understanding and a sense of interdependence in the world community of Friends. At the end of 1946 the committee was looking forward to another World conference to be held possibly in 1950.

In the western hemisphere, where the majority of Friends were concentrated, signs of unity were increasingly apparent after a century of divisions. The largest single group, the Five Year's meeting (representing 11 yearly meetings in Canada, the United States and Central America), met in regular quinquennial session in 1940 and 1945 at Richmond, Ind. On both occasions fraternal delegates and visitors were present from yearly meetings of other branches. The meeting in 1940, held in the shadow of the coming war, reaffirmed the pacifist position of the Society of Friends and authorized the establishment of a yearly meeting in Jamaica. The meeting in 1945, held just after the cessation of hostilities, authorized the creation of a yearly meeting in Kenya Colony, Africa, where a mission station had been maintained since 1902. Friends General conference, representing six so-called Hicksite Yearly meetings, met biennially at Cape May, N.J., for discussion of Quaker concerns in the fields of education, peace, social service and the advancement of Friends principles. The remaining U.S. yearly meetings, including six conservative groups and four evangelical and fundamentalist groups, co-operated in greater or less degree with other Friends in conferences and in common programs of war relief and provision for conscientious objectors.

The American Friends Fellowship council, established in 1936, was active throughout the period in promoting understanding and a spirit of unity in American Quakerism. One of its principal undertakings was the sponsorship of the Wider Quaker Fellowship, composed of "friends of the Friends"-persons who belonged to other religious groups but who desired fellowship with Friends. The phenomenon of "united meetings"-local meetings affiliated with both Orthodox and Hicksite Yearly meetings-became widespread in the eastern states. Many new meetings, independent of any yearly meeting but affiliated with the American Friends Fellowship council, came into being, especially in university centres. In Canada three yearly meetings began holding concurrent sessions in 1943. The Orthodox and Conservative Yearly meetings in New England, joined by the Connecticut Valley Association of Friends, formed one yearly meeting in 1945. In New York, Philadelphia, and Baltimore, Orthodox and Hicksite yearly meetings began holding regular joint sessions, and in 1946 the two groups in the Philadelphia region came together to form a general meeting under which each yearly meeting would retain its separate identity. Although marked differences persisted in theological emphasis and type of ministry, the tide in many sections of U.S. Quakerdom was setting in the direction of further unity.

During World War II, European Friends were in large measure cut off from each other. British Friends continued active in public life (ten Quaker M.P.'s were returned in the 1945 elections) and in various forms of war relief. On the European continent universal military conscription (with no alternative service for conscientious objectors) made it difficult for the Society of Friends to survive as a body maintaining its characteristic peace testimony. Not a few Ouakers were sentenced to concentration camps for refusing military service. Nevertheless, the German yearly meeting was able to hold regular annual sessions until 1941. During the German occupation of France, French Friends took over the operation of the Paris International Centre, earlier supported by British and U.S. Friends. With the ending of the war, European Quaker groups revived. Their chief postwar concerns, besides relief work, were relations with other churches and the œcumenical movement, the meaning of the Quaker peace testimony in the light of wartime experiences, and attitudes toward Friends and others in former axis countries. Reconciliation and the desire to restore the international community of Friends were keynotes of the addresses issued after the war by several European yearly meetings.

* * *

ALTHOUGH many individual Friends were not wholly consistent, the Society of Friends, speaking through its yearly meetings, upheld throughout the period its traditional testimony against all war and in favour of Christian love and brotherhood. Virtually every yearly meeting reaffirmed its adherence to this principle and worked to strengthen the testimony among its members and to influence public opinion.

American Friends participated actively in the emergency peace campaign in 1937. The peace section of the American Friends Service committee carried on its "peace caravans" and institutes on international relations as a means of educating public opinion on world affairs and the problems of peace and war. Starting in 1939, work camps were held in Mexico, providing projects of a public-service nature on which young persons could volunteer to work as a means of promoting international understanding and good will. Similar work camps on a year-round, summer or weekend basis were also operated in the United States by the social-industrial section.

In 1944 the committee, recognizing the seeds of strife inherent in the U.S. racial situation, established a race relations program, offering educational, counselling, and placement services. After Pearl Harbor, when thousands of U.S. citizens of Japanese ancestry were uprooted by military order from their homes on the Pacific coast and transferred to "relocation centres" behind barbed wire, Friends went to their aid, chiefly by finding new homes and educational opportunities for them. In 1943 the Friends Committee on National Legislation was established to keep American Friends informed on legislative developments at Washington, D.C., such as proposals for peacetime military conscription to which Friends were almost unanimously opposed.

With the coming of World War II and compulsory military training in Great Britain and the United States, many young Friends took the position of the conscientious objector. In Great Britain, 1,282 Friends (35% of the men members liable for service) appeared before tribunals to establish their position; 16% were given complete exemption; 80% were given exemption conditional upon their

performing civilian duties specified by the tribunal; 3% were assigned to noncombatant duties in the army; and 1% were denied the status of conscientious objector. Approximately 150 Friends served prison terms for various offences against the National Service acts. In the United States, although accurate figures were unobtainable, it was probable that a somewhat smaller proportion of Friends of draft age took the conscientious objector position. About 650 entered Civilian Public Service camps, 60 were imprisoned for conscience's sake, and an indeterminate number accepted noncombatant service with the military forces.

English Friends undertook no administrative responsibilities in connection with conscription, although Quakersponsored organizations like the Friends Ambulance unit made use of conditionally exempted conscientious objectors. In the United States, Friends co-operated with the Mennonites and Brethren, the other "historic peace churches," in administering a program of alternative service. Between 1940 and 1945, more than 3,000 conscientious objectors of all faiths served without pay or dependency allotments under the direction of the American Friends Service committee in 20 forestry, conservation and park service camps, and 32 special service units, where they worked in mental hospitals and training schools, public health projects and as human "guinea pigs" in medical research. Friends' participation in the administration of the Civilian Public Service program ended on March 2, 1946, six months after V-J day.

Throughout the ten-year period, Friends were engaged in relief work in some quarter of the globe. During the Civil War in Spain, British and U.S. delegates of the Friends Service council and the American Friends, Service committee carried on nonpartisan relief work behind the lines on both sides of the conflict. With the coming of World War II, relief work became a major concern of Friends everywhere.

In 1939 the Friends Ambulance unit was organized by British Friends to undertake medical work with the army, medical relief and other services. Medical relief work was carried on in bombed sections of London, and relief teams were sent to Finland, the middle east, North Africa, Italy, France, India and China (where in conjunction with Canadian, New Zealand and American Friends they hauled medical supplies over the Burma road and staffed civilian hospitals). The Friends War Victims Relief committee was set up by a London yearly meeting in 1940 to co-ordinate work already being done by Friends to alleviate suffering caused by air raids. In 1943 the committee, reconstituted as Friends Relief Service, undertook overseas relief work which eventually extended to Egypt, North Africa, Palestine, Spain, Italy, Germany, Holland, France and the Greek islands.

Throughout the war German Friends aided refugees and English and French prisoners of war. French Friends worked chiefly with civilian prisoners and refugee children. When U.S. Quaker workers in the south of France were interned by the Germans in 1943, the extensive program of relief work among political prisoners and refugees was taken over by Secours Quaker, a French organization. Because of their known neutrality and good faith, Quaker workers were allowed to continue their services to political prisoners throughout the Vichy, nazi and De Gaulle regimes.

The American Friends Service committee, through its office at Lisbon, Portugal, helped hundreds of refugees to escape from nazi Europe. Other U.S. Quakers worked with political prisoners in North Africa and with Yugoslav refugees in Egypt. Milk, vitamins, and anti-malarial

drugs were sent in great quantities to Bengal during the famine of 1943. With the end of the war and the spread of famine, a tremendous and tragic opportunity came to U.S. Friends. A unit of trucks and drivers was formed to transport food and building supplies in Europe where transportation had broken down. U.S. Quakers helped to rebuild ruined homes in Finland and Italy, and provided food, clothing and medical supplies in Germany, Austria, Poland and Japan. Everywhere they went, Quaker workers sought to bring, in addition to material relief, a message, spoken or unspoken, of Christian love and reconciliation to the people of a world not yet released from the throes of violence and hatred.

Frings, Joseph

Cardinal Frings (1887—), archbishop of Cologne, was born at Neuss, Germany, on Feb. 6, 1887. He was ordained priest in 1910, and served as rector of the Major seminary at Bensburg for many years. Named archbishop of Cologne in 1942, he condemned nazi atrocities. He remained with his flock despite severe bombings of the cathedral city until 1944, but returned again in March 1945 when he was reported held by the nazis. After the end of the war, he laid plans to restore the famous Cologne cathedral to its former splendour by 1948, the year of the 700th anniversary of its foundation. He was proclaimed a cardinal by Pius XII on Feb. 18, 1946.

Fruit

The total crop of the 18 principal fruits grown in the United States increased to a new high level during the decade 1937-46. This increase was due to the rapid expansion of the citrus crops, oranges and grapefruit. The total tonnage of the eighteen fruit crops in 1937 was estimated by the U.S. department of agriculture at 14,630,000 tons, of which 2,776,000 tons were oranges and 1,198,000 tons grapefruit. In 1944, the comparable totals were 17,022,000 tons for all fruits, 4,506,000 tons of oranges and 2,032,000 tons of grapefruit. The relatively low prices for several years and the economies of large-scale operations tended to concentrate fruit production into larger units in commercial areas. The pruning, spraying and fertilizing operations improved yields in favourable years and prepared the industry for expansion, particularly in the citrus areas. Other than citrus, the total of the crops continued at about the average total of 1925 to 1935. The tonnage of citrus, oranges, grapefruit and lemons, was 45% greater in the five years 1939-43 than in the previous five years. Large citrus plantings were made in the 1920s and 1930s, that were coming into fall bearing at the end of the decade 1937-46. Most of these trees were yet relatively young and would continue to increase the crop. Authorities had warned against heavy surpluses for several years and the demand during World War II probably prevented a disastrous glut of citrus in the early 1940s. Apples declined moderately in total production and were surpassed by oranges in tonnage. Grapes, third in importance, increased slightly. Cherries and figs increased, but peaches, plums, prunes and apricots remained about the same. The increases in the west were fairly rapid while in the old fruit areas of the North Atlantic states production declined. Planting of trees during the latter part of the decade provided the base to mountain production under improved culture.

Apples.—The U.S. apple crop was one of the few crops which declined in quantity during the decade, and particularly during the war years. Since apple trees cannot be brought into bearing quickly, the area of the orchards in the prewar period determined the output. Between 1919 and 1938 the total U.S. crop had varied from 95,000,000 bu. in 1921 to the biggest crop, 229,600,000 bu., in 1926. After 1938, estimates were restricted by law to the commercial crop. In 1937, the total crop was put at 210,783,000 bu. and the commercial crop at 156,376,000 bu., the difference being farm production of which only a small part left the area of production. The commercial crop almost reached 143,085,000 bu. in 1939, the same as in 1935, and then declined to an average of 119,046,000 bu. during the period 1934-43. The crop of 1945 was the smallest on record, only 68,042,000 bu. This low output was due to a spring freeze and bad weather for pollination in the eastern states. Insect and disease damage was also high. The eastern apple states usually had produced nearly two-thirds of the total crop, but in 1945 yielded less than one-third. The 1946 crop returned more to normal and was estimated at 121,520,000 bu. in December.

Farm prices of the commercial crop of apples were at the low average of 64 cents per bu. in 1937 and advanced to 96 cents by 1941, then to \$2.39 in 1943. During 1944–46, prices were at ceilings—about \$3.60 per bu. in the first half of 1946. The price in mid-1946 varied from over \$5 per bu. for New England to \$3.53 for the northwestern crop. Ceiling prices were adjusted upward as a "disaster" allowance in June and July, 1945, at the rate of 30 cents per bu. The government issued "set-aside" orders in 1945 in order to get adequate supplies for military and other government uses, reducing the civilian supply to less than one-half bushel per capita, which was about 30% lower than the prewar average.

Exports of apples ranged from 10,000,000 bu. to 29,300,-000 bu. before 1937, when the net exports were 15,511,000 bu. Exports rose to 17,761,000 bu. in 1938 then dropped rapidly to a low of 567,000 bu. in 1944. In 1945, exports were restricted to the quantities authorized by the government. Foreign markets provided the best outlet for the smaller sizes of apples for several years. The short crops reduced the quantity of apples available for processing, since normally about three-fourths of the crop had been sold for use as fresh fruit. The strong consumer purchasing power was also a factor in supporting the fresh fruit market. Usually about 10,000,000 bu. were canned, 6,500,-000 bu. dried and 10,000,000 bu. used in other processed products such as cider, vinegar, juice, jellies and frozen products. Imports of Canadian apples were particularly large in 1944, amounting to 2,396,000 bu.; previously they had not exceeded 588,000 bu. after 1921.

World apple production outside the United States was confined largely to Canada, with an average of about 13,000,000 bu. 1931-35, and Europe, with an output of 240,000,000 bu. during the same period. In Europe most of the crop was produced in France, Germany, Switzerland and Italy. The United Kingdom crop seldom exceeded

10,000,000 bu. The world crop was estimated at about 519,000,000 bu. in 1935-39 and 349,000,000 bu. in the 1945-46 season. In spite of this small crop, world apple production was well maintained and increased in some countries. The European crop was 238,000,000 bu. in 1945, compared with a prewar average of 350,000,000 bu.

*Preliminary estimate	•							

Apricots.-As usual, the U.S. apricot crop was ninetenths a California production, with Washington and Utah adding most of the remainder. The crop increased slowly in California after 1900 and most rapidly in Washington and Utah after 1925. In 1937, California had a record crop to that date of 311,000 tons, Washington 10,100 tons and Utah about 1,600 tons. In 1938 another higher record was made with increases in all three states. In 1942, the California production dropped to 80,000 tons, Washington had 15,400 tons, and Utah made a new high record of 10,100 tons. The crops then jumped to a new high record of 354,000 tons because of a high production in California. About half of the crop was dried, one-fourth canned and 15% sold for fresh consumption. The amounts frozen increased after 1942. Exports of the canned and dried product averaged more than 65,000 tons in terms of fresh fruit after 1937. During the decade 1937-46, prices advanced from a national average of \$38 per ton in 1937 to \$132 per ton for the short crop of 1943 and about \$95 during the remainder of the decade. Ceiling prices were adjusted for dried apricots to encourage maximum production, to meet war needs and to return an average of \$560 per ton for all states. In 1944 the average in California was \$610 per ton.

Avocados.-U.S. production of avocados expanded in both California and Florida after 1937, when total production was estimated at 7,400 tons. California produced 5,300 tons and Florida 2,100 tons. Previous to 1929 this crop was important only in California, and total production was less than 1,000 tons. Total production in the United States increased in 1938 to 17,000 tons, and in 1943 to the high record of 25,900 tons. Most of these increases were in the California crop. The crop was poor in 1944, only 14,000 tons, but in 1945 rose to 22,400 tons and in 1946 to 16,400 tons. The prices of avocados increased after 1941 to the level of earlier years when the fruit was a high-priced delicacy. California producers received an average of \$152 per ton in 1937 and \$500 per ton in 1944, when the crop was much below the average of the decade. The Florida fruit advanced from an average of \$95 in 1937 to \$140 in 1944. Imports averaged about 5,000 tons

annually until 1941, when they dropped to about 1,000 tons average.

Bananas.-World banana trade was at a high level in 1937, with 120,000,000 bunches entering foreign trade. With the outbreak of World War II, exports fell to 94,-000,000 bunches in 1939 and declined further to 30,000,000 bunches in 1943. With improved shipping conditions, however, the total trade rose to 35,000,000 bunches in 1944 and 40,000,000 bunches in 1945. The United States was the world's largest importer, usually taking half of the exports and four-fifths of the volume in the war years. In 1937, imports into the United States amounted to 66,587,-000 bunches, the highest in ten years. Imports declined steadily to a low volume of 27,228,000 bunches in 1943. Recovery of the trade was slow after the war's end, but by 1945 over 40,000,000 bunches arrived. The chief handicaps to the trade were the loss of the special banana ships during the war and the growers' troubles when they lost their markets. About 83% of the world's production remained in Central America, the rest in Africa, Asia and Oceania." The industry probably would not completely recover for several years.

Cherries.-The cherry crop expanded in the United States during the decade 1937-46 and established a new high record in 1944 and a still higher average in 1946. The total production of all varieties, sweet and sour, was estimated in 1937 at 144,030 tons. In 1939, the crop was 177,580 tons, in 1944 201,590 tons; in 1945 140,660 tons and in 1946 215,360 tons. Of the 1944 crop, 85,300 tons were sweet varieties mostly grown in the Pacific states, and 116,790 tons were sour varieties, of which Michigan produced 50,000 tons and Wisconsin 15,000 tons. The big crop of 1944 was largely due to the big crop of the sour varieties in Michigan, which was about 15,000 tons above the average of 1938-42. The spring weather was very favourable in the Great Lakes region in 1944. The production of sweet cherries was less variable because weather hazards are less in the Pacific states than in the east. Of the sweet varieties, about half were sold to be consumed fresh while only a third of the sour varieties were consumed immediately. Imports of cherries were not important and almost ceased during World War II. Prices of all varieties were at an unusual high in 1937, averaging \$104.42 per ton for the whole crop. The average of 1038-40 was \$68 per ton, followed by a rise each year to \$212 per ton in 1944. In May 1945 price ceilings were removed and prices rose until mid-June, then declined. For the first time, sour cherries at \$260 per ton came near to sweet cherries at an average of \$272 per ton. This high price was due partially to the scarcity of all fruits in the eastern markets.

Cranberries.—An all-time high record production of U.S. cranberries was established in 1937, after which the crop dropped back to the general level of the previous 20 years. The acreage of cranberries, requiring special soils or bogs for profitable yields, reached a total of 27,000 ac. in 1913, and continued at about this level except for occasional years until 1924, when the acreage increased to about 27,500 ac. In 1937, the crop was harvested from 27,840 ac. and in 1941 it expanded to 28,140 ac. and continued at this level to 1946. The production varied during all this period because of fluctuating yields, which ranged from a low of 13 bbl. per ac. in 1944 to a record of 31.5 bbl. per ac. in 1937. Yields had increased slowly after 1917 and averaged about 28 bbl. per ac. during the period 1937-41. Two years of low yields were recorded in the decade, but the average was above that of the prewar period. The low average was due to the great loss of the crop in Massachusetts, which usually had produced about two-thirds of the national total.

The total U.S. crop was 877,300 bbl. in 1937, because of the high yield, and in 1946 the harvest amounted to 846,200 bbl. while the average of the period was about 640,000 bbl. Variations in the crop from region to region were more characteristic than in the total crop. Practically all cranberries continued to be grown in five states—Massachusetts, New Jersey, Wisconsin, Washington and Oregon. Following the good year 1937 in all states, New Jersey and Wisconsin had less than half a crop in 1938. The next year, 1939, all improved together. In 1942, Massachusetts made a high record which swelled the United States total to a near-record, but in 1944 the Massachusetts harvest dropped to about one-third the average and made the smallest United States crop in 20 years.

Prices of cranberries fluctuated widely with the size of the crop. Since most of the crop was consumed fresh, a surplus depressed prices. The record crop of 1937 sold for an average of \$8.75 per bbl. while a year later a crop half as large sold for \$10.98 per bbl. As consumer buying power increased in 1944, prices rose to \$24.10 per bbl. but in 1945 dropped to \$18.40. About one-third of the crop was processed, i.e., canned or jellied, previous to 1937. After World War II began the proportion increased slightly. In 1944, about 155,000 bbl. of the crop of 369,700 bbl. was processed. Some relationship to cranberry demand was evidenced in the steady increase in turkey consumption. Increased consumer income available to buy higher-priced foods was also a factor. Cranberries do not rank high as a food, but the universal association with turkey made them a luxury food.

Dates.—Production of U.S. dates began to be important in comparison with imported dates during World War II. The date-growing industry had developed slowly after 1912 and did not produce 1,000 tons until 1930. By 1936, production was up to nearly 4,000 tons and then dropped to 3,630 tons in 1937. Bigger crops followed, up to the 1944 record of 13,140 tons, only to be followed by a poor crop of 4,520 tons in 1945. About 95% of the crop was grown in California. Imports of dates declined from 35,000 tons in 1925 to 25,822 tons in 1937. The low point was reached in 1943, when only 324 tons were imported; in that year the U.S. crop was 10,770 tons. In 1944, imports increased to 11,637 tons which, with the big U.S. crop of 13,140 tons, provided a domestic supply well up to the average of the prewar years. Prices advanced from an average of \$120 per ton in 1937 to \$530 per ton in 1944, and declined in 1946 as imports became available. During the decade 1937-46, the date-growing industry became firmly established.

Figs.—The growing of figs in the United States continued to be confined almost wholly to California and Texas. In California figs had been grown in commercial quantities for many years, but Texas had not come into the market until about 1920 and reached a peak of production in 1928, followed by a decline that continued through 1946. The total U.S. crop in 1937 was 99,710 tons fresh basis, of which 98,100 tons were grown in California and 1,610 tons in Texas. The California crop increased almost year to year until 1944, when the crop was 124,600 tons while the Texas crop was down to 750 tons, making a total crop of 125,350 tons. Most of the California crop was dried; in 1944 more than 105,600 tons of fresh figs were processed into 35,200 tons of dried figs. Nearly all of the Texas crop was used for commercial preserving. U.S. imports of dried figs averaged about 3,000 tons per year before 1937 except prior to 1929, when imports averaged above 15,000. Prices of California dried figs advanced steadily from an average of \$68 per ton in 1937 to a top of \$292 per ton in 1943. Texas fresh figs sold for \$60 to \$158 per ton in the same years. The premium on the dried product began with the war in 1941 as figs were included in military food supplies.

Grapefruit.—The U.S. crop of grapefruit made a sudden increase in 1936 to a new high level of production, the result of constantly increasing planting during several previous years. From a crop of 18,347,000 boxes harvested in 1935, the crop increased to 30,070,000 boxes in 1936 and then maintained an average of more than 40,000,000 boxes to 1946, including the record crop of 67,000,000 boxes in 1946. The greatest increase was in Florida and Texas, with smaller gains in California and Arizona. About half the crop of 1945 was grown in Florida. The hurricane of Oct. 1944 was estimated to have destroyed more than 15,000,000 boxes of Florida grapefruit. Somewhat less than half of the Florida crop was of the seedless varieties, although these varieties increased most rapidly. Texas production, usually about one-third of the national crop, increased rapidly, while in California the gain was less spectacular. The government advised against the expansion of grapefruit plantings for several years previous to 1937 with only moderate effect. The growing demand for the fruit was remarkable. Demand during World War II absorbed the increasing output without serious losses and at almost constantly increasing prices.

The price of grapefruit to growers averaged 57 cents per box in 1937 and dropped to 32 cents in 1938, followed by a constant advance to \$1.69 in 1944. Prices had been relatively high from 1924 to 1929, when they dropped to an average only half as high; this level continued through 1940, possibly as the result of over expansion of production from 1930 to 1940. Warnings were issued in 1946 that the end of the war would bring a return to the price level of the 1930s unless new marketing methods or export outlets were developed. The competition of oranges was increasing as production of the fruit was expanding rapidly.

Imports of grapefruit, principally in the form of canned segments and juice from Puerto Rico, amounted to the equivalent of 288,000 cases in 1937 but dropped to nothing in 1942. Exports greatly exceeded imports, amounting to more than 1,000,000 cases in 1937 and declining to about 740,000 cases in 1943.

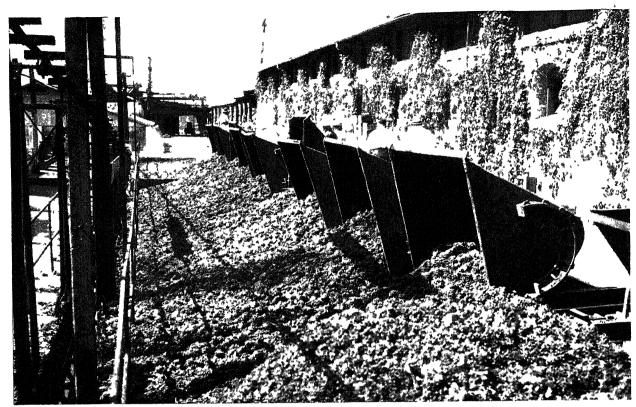

World grapefruit production increased rapidly, largely because of the expansion of the U.S. crop, which amounted to about 97% of the world total. The other producing areas, in order of importance, were Puerto Rico, Palestine, South Africa. World trade was reduced to about 2% of the world production during the war, confined to the United States and Palestine.

Grapes.—The production of grapes in the United States increased steadily up to 1937 and at a somewhat slower rate thereafter until 1943, when a high record crop was harvested.

Grapes continued to form the second crop in tonnage, next to apples, in the deciduous group of fruits. California, usually producing nine-tenths of the United States

The U.S. grape crop reached record heights in 1943, with the greatest increase of growth in California. This picture shows carloads of grapes being unloaded at Guasti, California

crop, harvested 95% of the total crop in 1945.

The California crop was 58% raisin varieties, 23% wine varieties and 19% table grapes. Most of the grapes produced in other states continued to be used fresh. Practically all the raisins produced in the United States were dried in California. Most of the California crop was used for the purposes for which the varieties were best adapted, viz., raisin varieties for raisins and wine varieties for wines, except that some raisin groups were crushed for wine and brandy. The Washington crop was used principally for juice and wine in 1944-46 and a considerable portion was preserved frozen. New York grapes were largely crushed for juice, only about 8% being sold for consumption as fresh fruit. The big Michigan crop was used principally for juice. Most of the production outside of the

nine leading grape states was consumed as fresh fruit. The total U.S. crop in 1945, 2,791,000 tons, was divided as follows: consumed on farms, 26,490 tons; sold fresh, 533,200 tons; canned, 11,000 tons; dried, 969,200 tons; crushed for wine and sweet juices, 1,239,760 tons. Raisin production showed the most rapid increase after 1937. The bearing acreage of grapes did not increase much during the decade 1937-46, but better yields were harvested as the result of more fertilization and care. New plantings in

Washington increased the crop of that state. Old plantings in the eastern states showed a declining yield.

Prices of table and wine grapes made the greatest advances during the decade. Table grapes averaged \$21.80 per ton in 1937 and rose to over \$100 per ton in 1944 and 1945. The wine varieties advanced from \$21 to \$111 per ton in 1944 while raisin grapes, which averaged only \$17.80 per ton in 1937, declined in price until 1940 and then advanced to \$52.30 in 1944.

Grape production for raisins was stimulated by a government support program during the war period. Payments to producers, subsidies to maintain raisin prices to consumers at reasonable levels, and ceiling prices for grapes sold for fresh consumption were the principal measures used. The government required the raisin crop of 1944 to be set aside in order to ensure an ample supply for military and lend-lease requirements. This reduced civilian

*Preliminary esti	me	ate																	

supplies for that year about one-fifth, leaving less than an average of 3 lb. per capita for civilians. A considerable part of the output of grape juices was also taken for military requirements. Exports of fresh grapes amounted to about 35,000 tons in 1937 and declined to about 23,000 tons during the war years. Exports of raisins increased from 76,000 tons to 104,000 tons in 1944.

World grape production at the beginning of the decade was at a high level in Europe and declined as the war progressed after 1940. Most of the European crops continued to be wine grapes. Since wine was not considered a food, reliable statistics were not published during the war, and the actual changes in each country were not generally known. World production of wine (q.v.) was estimated at about 4,500,000,000 gal. in 1937.

Lemons.—The California lemon crop, amounting practically to the U.S. total, increased after 1937, making its high record in 1940, when a crop of 17,236,000 boxes was produced. The average crop before 1937, about 6,500,000 boxes, rose to an average of 11,337,000 boxes during the period 1934–43. Prices of lemons were relatively high previous to 1937 and dropped to a lower level from 1937 to 1940, when they brought growers only \$1.23 per box. By 1943 the average price advanced to \$3.27 per box and then declined to \$3 per box in 1946.

Imports practically ceased in 1938. The United States became the largest producer of lemons in 1939, surpassing Italy, the only other important lemon-growing country. These two countries produced about 80% of the world total. Italy ordinarily exported most of its surplus to European countries and Great Britain. Lemon production expanded slowly in Palestine and Spain. The world's crop was estimated at 32,942,000 boxes in the record year 1940.

Limes.—Almost entirely confined to Florida, the production of limes averaged about 25,000 boxes until 1937, when it increased suddenly to 70,000 boxes. The average of 1934-43 rose to 93,000 boxes and then increased rapidly to 250,000 boxes in 1944. This increase was the result of closer picking and favourable seasons. Mexico continued to be a large producer of limes. Imports into the United States reached the high record of 145,000 boxes in 1936, then dropped steadily to an average of about 50,000 during the war years. Prices to growers declined from a season's average of \$3.25 per box in 1937 to \$2.10 in 1941 and then advanced to about \$5 per box in 1943-46.

Olives.—World production of olives, centred around the Mediterranean Sea—in Spain, Italy, Greece and North Africa—increased slowly in most of the older olive-growing areas as better tree culture was introduced. World trade continued to be confined largely to the oil. There was little net export trade; countries like Italy and Spain, with high oil consumption, imported cheaper oils to replace the higher grades exported.

The United States olive industry continued unable to supply domestic needs. The California olive crop continued to account for more than 99% of U.S. production. The olive tree requires a long period of growth to come into bearing and the crop is not subject to quick increase except by more careful harvesting. U.S. olive production expanded slowly from an output of around 8,000 tons before 1922 to an average of about 20,000 tons before 1937. In 1937 a crop of 28,000 tons was harvested, followed by a succession of large crops more than double the pre-1937 average. The growers anticipated the need for oil that would follow a war in Europe and by close harvesting gathered a record crop of 69,000 tons in 1940. This was followed by three big crops of over 55,000 tons in 1941, 1942 and 1943, 42,000 tons in 1944, 31,000 tons in 1945,

and 46,000 tons in 1946. The advance in the price of olives was spectacular. From \$67.60 per ton to growers in 1937 the price rose, except for a decline in the one year 1938 to \$45.80 per ton, to \$200 per ton in 1944.

The larger part of the U.S. crop was crushed for oil in the decade 1937–46. Of the record crop in 1940, 39,100 tons were crushed, 16,200 tons canned and 12,000 tons utilized in other ways. The decline in U.S. imports of olive oil after 1940 accounted for the increase in crushings of the domestic crop. The premium price on the oil was also a factor.

Oranges.—World orange production was estimated at an average of 176,320,000 boxes during the period 1930–34; thereafter it increased to 233,929,000 boxes in 1940. Then followed a small decline in most countries during World War II but the large U.S. crop held the total up to 230,170,000 boxes in 1944. Oranges accounted for about 73% of the world's total citrus production and the United States grew 49% of the world crop, Spain 8%, Brazil 9%, Italy 5%, Palestine 3% and the remaining 26% in several other countries. The prewar trade took about 20% of the crop with the United Kingdom importing about one-third of the total. The principal exporting countries before the war were Spain, Palestine and the United States.

The U.S. production of oranges expanded rapidly during the decade 1937-46 and had more than quadrupled since 1919; with grapefruit, oranges were almost equal in tonnage to all other fruits combined. This great increase was under way long before World War II, and the enlarged output was the result of young trees coming into bearing and the large growth of the older trees. The distribution of the crop continued to be in five states, California, Florida, Texas, Arizona and Louisiana, in the order named. The California crop was about one-third larger than the Florida crop during the decade with the other three states supplying only about 5% of the total crop. The increase was somewhat more rapid in Florida than in California, however. Texas more than trebled its production from 1937 to 1944. The Florida crop was about evenly divided between early and Valencia varieties, while in California the Valencias were almost double the volume of Navels and other kinds. The Texas, Arizona and Louisiana crops were mixed. The principal crop loss of the decade was in Florida in Oct. 1944, when a hurricane destroyed about 20% of the early crop.

Prices of oranges reached the low level of two decades in 1938, when they averaged only 79 cents per box to the growers following the increase in the total crop from 54,500,000 boxes in 1936 to 74,200,000 boxes in 1937, and another big crop in 1938. The market strengthened in 1939 and advanced steadily to an average of about \$2.50 per box during the years 1942-44. Exports ranged from 3,000,000 to 7,500,000 boxes during the decade, principally to Canada until the war, when quantities were shipped as juice by lend-lease and to foreign military areas. Imports were never important.

The quantity of U.S. oranges processed for juice and canning increased steadily from 5,800,000 boxes in 1937 to almost 10,000,000 boxes in 1940. During the war years the demand for juice and pulp increased so that by 1944 more than 23,542,000 boxes were processed, leaving about 84,200,000 boxes to be used as fresh fruit.

The civilian consumption of citrus fruits increased from a prewar average of 48.3 lb. in 1935-39 to 68 lb. in 1944 and 65 lb. in 1945. This included both oranges and grapefruit. At the same time, the consumption of canned fruit

juices rose from 4.1 lb. per capita, prewar average, to 10.3 lb. in 1945. During the war years, the military and lendlease took large quantities amounting to about 30% of the total supply of U.S. canned fruit juices.

*All trees killed by freeze in 1940. No reports after that year.

Tangerines.—The Florida tangerine crop, and small quantities grown in California, Texas, Arizona and Louisiana, became a more important U.S. citrus product during the decade 1937–46. Florida's production increased from 2,300,000 boxes in 1937 to 5,200,000 boxes in 1946. Practically all the crop was consumed as fresh fruit at advancing prices which compared closely with the prices of oranges, the tangerine's principal competitor. Also grown in Italy in quantity, and to some extent wherever oranges are grown, tangerines had never made an important market for themselves in competition with oranges.

Peaches.—The production of peaches in the United States had been increased for many years. Two record crops, 81,500,000 bu. in 1945 and 86,400,000 bu. in 1946, were much above the 1935-44 average of 60,000,000 bu. Peach production fluctuated widely from year to year since the crop is very subject to frost and insect damage. The 1943 crop, just preceding the three big crops, was only 42,000,000 bu., the smallest in 23 years. During the decade 1937-46 peaches amounted to about 17% of non-citrus U.S. fruit production. The use of peaches changed slowly. Of crops during the latter part of the decade, about onehalf was sold to be consumed fresh, one-fourth was canned. about one-tenth was dried and an increasing amount was frozen. In 1945, about 2,300,000 bu. were frozen. Peaches retain their quality to a high degree when frozen, and both commercial and home-freezing promised to take an increasingly larger part of the crop. Canned peaches continued to come from the large commercial or orchard centres, but the introduction of freezing was expected to stimulate a wider distribution of peach growing in areas where the crop had been abandoned for 20 years or more while the commercial areas were expanding rapidly. After 1934, California produced about 40% of the total U.S. crop, and canned peaches were mostly California cling-stones. Practically all drying was confined to California and to freestones. Freestones were canned in larger quantities and cling-stones were also dried. The 1946 crop of California clingstones, providing about 90% of canned peaches, returned the largest crop since 1930.

Prices of peaches were at an average of \$1.04 per bu. in 1937 with a crop of 59.724,000 bu., but dropped during the next four years to about 80 cents per bu. With the war demand, prices advanced to \$2.65 average in 1943, then declined for the record crop of 1944 to \$2.35. The big crops of 1945 and 1946 sold well, and the seasons' average prices were close to the level of 1944. The average price for fresh peaches in 1944 was \$2.75 per bu. and in 1945 \$2.56. For canning, growers received \$55 per ton in 1944 and \$57 in 1945. The ceiling prices for peaches were designed to give growers a national average of \$2.16 per bu. in 1944 and 1945. These ceilings were adjusted by regions

and by grade of peaches through the season.

Large quantities of dried peaches were taken by the U.S. government for military, lend-lease and relief uses. Of the 1944 crop, the first of the three record crops during the war, which amounted to 75,963,000 bu., 18,331,000 bu. were canned; 7,298,000 bu. dried; 1,476,000 bu. were processed in other ways and the rest was used fresh. Exports of both dried and canned were heavy. Peaches were dried in quantities in other countries, principally Argentina, South Africa, Chile and Australia. In 1944 the total was estimated at 81,000 tons, compared with 175,000 tons in the United States.

All other states less than 400,000 bushels.
*Preliminary estimate.

Pears.—Pear production reached a high record in the United States during the decade, almost 50% above the level of ten years earlier. California continued to be the centre of production, harvesting three-fourths of the nation's crop in 1945. Production in the Pacific states averaged about two-thirds of the total crop; three-fourths of this western crop was of one variety, Bartlett. The crop varied from 24,585,000 bu. in 1943 to 35,488,000 bu. in 1946. The pear crop fluctuated less than most other fruit crops because such a large part of the total was grown in California, where the weather hazard is less than in the east.

About half the crop was sold for use as fresh fruit, about one-third canned, and only 5% dried. Of the car-lot shipments of about 12,900 cars in 1944 and 1945, 93% originated in the three states of Washington, Oregon and California. Nearly all the pears used for canning were of the Bartlett variety, but about one-half of those sold fresh were Bartletts. Other leading varieties were D'Anjou and Bosc.

Prices of pears were at a level of about 75 cents per bu. in 1937 but began to rise in 1941 to a record of \$2.36 per bu. average in 1943. In 1944-45, prices declined slightly but recovered in 1946 to record levels.

The part of the pear crop canned increased from about 7,000,000 bu. in 1937 to 10,797,000 bu. in 1942 and then dropped off. At the same time, the quantity dried declined from an average of about 1,500,000 bu. to 900,000 bu. Exports for fresh consumption amounted to over 170,000,000 lb. in 1938 but dropped to 6,000,000 lb. in 1943. The amount of canned pears also declined during the decade, from 77,000,000 lb. in 1938 to 12,288,000 lb. in 1944. Imports ranged from 2,054,000 lb. to 15,427,000 lb. in the 1937-46 decade.

World production of pears before World War II centred in the United States and Germany, with total crops about

Table VI.—U.S. Pear Production by Leading States, 1937–46
(In thousand bushels)

equal. The average for
1931-35 in the United
States was 25,568,000 bu.;
in Germany 23,750,000 bu.;
the world crop averaged
122,253,000 bu. Other pear-
growing countries of im-
portance were France, 16,-
000,000 bu.; Italy, 9,503,000
bu.; Switzerland, 8,103,000
bu.; Japan, 7,127,000 bu.;
Czechoslovakia, 5,218,000
bu.; Austria, 4,368,000 bu.;
and Spain, 3,255,000 bu.
The world crop declined
sharply after 1944, when
the war extended to Cen-
tral Europe. Tree destruc-
tion was not general, how-
ever, and the crop was ex-
pected to recover as fer-
tilizers became available.

Plums.—The U.S. plum crop held to a very stable average from 1937 to 1943, varying only from 65,500 tons in 1938 to 79,400 tons in 1943. Then, in 1944, a record crop of 98,200 tons was harvested, nearly 30% above the previous year and over 40% above the ten-year 1933–42 average of 67,340 tons. This phenomenal crop was due to the great increase in California, where most of the fruit was grown. In 1946, production again made a high record of 105,000 tons, with the greatest gains in California, where the crop was 37% above the average.

*Preliminary estimate.

Prunes.—The prune crop declined through the decade 1937–46 from a total production of 714,500 tons in 1937 to about 650,000 tons average in 1944–46. The yield declined and harvesting was handicapped by labour shortage. On the dry basis the typical crop of 1944 was divided as follows: Washington, 300 tons; Oregon, 4,100 tons and California, 158,800 tons. Of the same crop, about 8,800 tons were frozen, 20,900 tons canned and the remainder sold for fresh consumption. Practically all California prunes were dried. Canning and freezing increased after 1943. Dried prunes comprised about 85% of the crop. The government required all prunes to be set aside for government purchase in 1944 as a large part of the supply was taken for military, lend-lease and relief uses. Civilian supplies were reduced sharply during the war years.

Prices of the prune crops declined from 1937 to 1938 and then began a steady advance which continued through 1946. The low point was an average of \$17.50 per ton for the crop of 1938 and a high of about \$90 for that of 1946.

U.S. Total . . California

U.S. Production of Dried Prunes, 1937-46 (In Thousands of tons)

	1937	1939	1941	1942	1943	1944	1945	1946
U.S. Total	256.2	213.4	184.6					
California	249.0	185.0	1 <i>77.</i> 8	170.8	195.8	158.8	225.8	204.8
Oregon	6.5	26.6	6.4	5.9	11.3	4.1	7.7	8.7
Washington .	.7	1.8	.4	.1	.6	.3	.2	.4

Prices of dried prunes advanced even more rapidly, from \$54.60 per ton in 1938 to over \$220 per ton in 1946. Ex-

ports of dried prunes declined during the latter years of the decade from about 100,000 tons in 1940 to 45,000 tons in 1944. Large quantities were used by the military forces, however.

Pineapples.—Concentrated entirely in Florida, the U.S. production of pineapples fluctuated widely from a high of 25,000 boxes in 1936, and 15,000 boxes in 1937, down to 3,000 boxes in 1943. The crop of 1944 rose to 15,000 boxes; 10,000 boxes were produced in 1945 and about 20,-000 boxes in 1946. Prices advanced from an average of \$2.50 per box in 1937 to \$6.00 in 1943 and about \$5.50 in 1944-46. Most of the U.S. supply was shipped from Hawaii in the form of canned pineapple before World War II, while the Florida crop was mostly used fresh. The Hawaiian shipments of canned pineapple reached a high level of 595,000,000 lb. in 1937 but dropped off to around 143,000,000 lb. by 1945. Juice shipments also declined about 50% in the same years. The major supply of fresh pineapples came from Puerto Rico in the prewar period, over 500,000 boxes being received in 1937. These shipments were shut off completely in 1943-45, making the civilian supply very short in those years.

Strawberries.—The average commercial crop of strawberries in the United States was lower during the decade 1937-46 than in the previous ten years. A big crop of 13,-400,000 crates was harvested in 1942. A decline to 5,033,-000 crates in 1944 was followed by a recovery to about 7,300,000 crates in 1946. This was due to the downward trend of acreage from about 200,000 ac. in 1924 to a low of 87,000 ac. in 1945. Shortage of labour was the principal factor in causing the decline during the war years. Practically all of the commercial crop formerly had been used fresh, but new freezing processes increased rapidly from 1940 to 1946. The average of prices varied with the size of the crop from \$2.50 per crate to a record of \$8.50 per crate in 1945 as a result of the strong consumer demand. Storage holdings of frozen strawberries in June 1946 were 27% larger than the 1941-45 average, showing the increase in this method of preservation. Most of the crops of Oregon and Washington were frozen or canned. (See also Agri-CULTURE; CHEMURGY.) . (J. C. Ms.)

Fuel Briquettes

Shortages of fuel during World War II caused the production of fuel briquettes in the United States to increase rapidly, since briquetting provided a satisfactory fuel from low-grade material, much of which could not have been utilized otherwise. Expansion was particularly marked in the Great Lakes region, where the plants utilized the coal fines from the lake shipping ports. More than half of the production capacity was in this area. The 1937 output of 995,930 short tons sagged to 871,260 tons in 1938, but rose sharply each year after 1939, to 2,762,204 tons in

Plant capacity did not change greatly (from 3,423,400 tons in 1937 to 3,782,900 tons in 1945), but the rate of operation increased from 34% of capacity to 73%. In 1945 there were 32 plants in active operation, while 7 more, with a capacity of 700,000 tons, were reported under construction or ready for operation in 1946.

In addition to the briquettes, there was an output of "package fuel," consisting of a number of cubical briquettes, weighing about ten pounds, wrapped and sealed in a package for convenience and cleanliness in handling. The 1937 output of 146,000 tons increased to 285,000 tons in 1940, but declined to 175,770 tons in 1944, largely because of shortage of labour and materials. In 1945, production recovered to 208,143 tons.

The briquetting of fuel was practiced in at least 25 countries, but mostly on a small scale. The prewar world production was of the order of 70,000,000 to 80,000,000 tons, but only 7 countries produced amounts over 1% of the total, and together accounted for about 95% of the total. Germany was far in the lead, with a normal output of 60,000,000 to 70,000,000 tons, with France second. After World War II the U.S. ranked third, followed by Belgium, Netherlands, Spain and the United Kingdom.

Fuller's Earth

After having reached a record high figure of 325,644 short tons in 1930, the production of fuller's earth in the United States suffered a steady decline to 226,165 tons in 1937, and a low of 146,568 tons in 1940, largely attributable to the substitution of other product (especially bentonite) in the refining of oils, which had formerly taken almost the entire output. After 1940, production was again on the increase, reaching 296,368 tons in 1945, more than double the 1940 low.

The Florida-Georgia area remained the largest producer, followed by Texas and Illinois, with small amounts from California, Nevada, Tennessee, and Utah. Increased pro-

Production and Use of Fuller's Earth in the United States (Short tons)

Furniture Industry

During the decade 1937-46, the furniture industry in the United States made greater technological progress than it did during the preceding 100 years, when furniture-making became a business instead of a trade.

After every great war in history, artistry had flourished. The same artisan who carried a crossbow into Picardy later returned home with fresh inspiration. And U.S. designers who served on the many battlefields of World War II returned to their drawing boards freed of the shackles of commercialism that once bound them to tradition.

Had not the war upset the routine of the furniture industry and diverted its efforts from case goods to aeroplane parts and glider wings, most factories still would have followed the old cabinetmaker's ritual and turned out period reproductions by the same wasteful methods, utilizing more manpower than necessary, because that was the way good furniture had to be made, or so they thought.

But army and navy engineers thought differently and, in their great need for more aeroplane parts, they visited furniture factories engaged on government contracts and taught the superintendents how to simplify and mechanize production methods.

The greatest time-saving innovation they introduced was the use of the conveyor system in handling materials and work in process of manufacture. Although the automobile industry had used conveyors for years, most furniture factories clung to the old system of hand-trucking parts to each bench and machine, permitting each artisan to add his contribution to each piece of furniture at his own speed.

As most cabinetmakers were gray-haired veterans, the speed was often a snail's pace.

Most manufacturers of high quality furniture were skeptical of this speedier system, but were willing to employ it at government request to increase war production. To their surprise, they soon discovered that the younger men, and some of the older, were turning out equally as good work when it was brought to them by conveyor as when it was trucked to their benches, and faster. This method of production made it necessary to divide the operations so that each man did only one or two instead of the many

But this revolution in furniture-making would have been impossible except for new materials, also introduced by government engineers. A new glue made of resin and urea was not only faster-setting under heat but also stronger than the wood it joined together. Better animal glues also were evolved, and the use of hot plate presses for bonding plywoods and shaping them speeded up production and made a more durable product. Then methods of impregnating woods to make them as tough as steel were introduced. A method of impregnating some woods with dyes instead of staining them later was conceived so that the entire lumber in a piece of furniture might be the same colour down to the core. Fast-drying plastic finishes added the final touch necessary to prevent bottlenecks in the finishing department, and the furniture industry surprised everyone, especially itself, with the amount of war work it was able to turn out-close to \$400,-000,000 in two years while still producing \$1,000,000,000 worth of household furniture and furniture for the Red Cross, the U.S.O. and for officers' quarters and army recreation centres. Since this work had to pass rigid government inspection, manufacturers became convinced that the new methods would produce a better product than the old materials and methods. With a backlog of \$5,000,000,000 worth of orders awaiting only the release of sufficient supplies of lumber, the furniture industry faced the postwar future with confidence.

The years 1937-46 marked a steady increase in production and a steady gain in net profits so that by the latter year the furniture industry was more prosperous than at any other time in its long history. By 1937 the 3,300 furniture plants still in operation after the long depression had begun to recover rapidly and turned out \$500,000,000 worth of furniture, more than double the 1933 output. By 1941 furniture production had risen to \$660,000,000, an all-time record. These factories included 2,300 woodworking plants, 900 upholstery establishments and 100 metalworking plants. Then came the war, and gradually more than 50% of these factories accepted government orders, but most of them also produced some household furniture to keep their dealers supplied because all their equipment and manpower could not be utilized for war work.

Some made glider wings, others aeroplane panels, many made bunk beds for ships, boat hulls and seats, while others made truck bodies, ammunition cases and 100 other items of wood.

Thus in 1943 the industry's production of wooden household furniture dropped to \$565,000,000, but \$200,000,000 worth of war goods had been added that year. With the end of World War II in 1945, production of household furniture shot back up to \$610,000,000. The 1946 output was estimated at \$700,000,000.

In the year after V-J day, some 300 new furniture factories were organized, principally in Michigan, North Carolina, Georgia, Virginia, California, New York and Washington. In addition, about 50 former aeroplane factories, metalworking plants, lumber and plywood mills and boatbuilders began to supply bedroom and dining room furniture, desks and tables, upholstered furniture, aluminum porch and garden furniture, kitchen furniture and other household items to the trade.

Comparing costs of production in 1946 under the new methods with those employed by most factories in 1937, the manufacturers' sales dollar was divided as shown in the accompanying table.

The reduction in direct labour cost was the most remark-

	D	liv	ısi	on	of	М	an	υf	acf	ur	ers	' S	ale	:5	Do	llar	1946, 1937

•																	100.00	100.00

able in the industry's history because, according to U.S. department of labour statistics, the furniture industry's average hourly wage rate in 1946 was 85.3 cents, an increase of 34.6 cents per hour from the 1937 hourly rate of 50.7 cents. It was the highest average wage ever paid by the furniture industry, which by 1946 had become about 50% unionized.

It would be misleading, however, to attribute the entire increase in production and the lower labour cost (despite higher wages) entirely to mechanized production. Furniture prices rose approximately 30% in the ten years after 1937, and in addition more high-priced and less low-priced furniture was made after the war. The industry actually was producing fewer units in 1946 than in 1937 despite the fact that its dollar output showed a gain of 40% during this period.

The World Industry.—Throughout the world, the war played havoc with the furniture industry, destroying factories in Europe that had been operating for more than a century, and destroying more homes and their furnishings than any previous war.

In Germany, the 1,000 furniture factories that served central Europe were practically wiped out. France's 1,200 small furniture factories almost passed out of existence during the long occupation, as all production facilities were concentrated by the German war lords on planes, guns and tanks. Slowly these small shops, employing from 10 to 50 employees, returned to life after the war, and France became the first nation on the continent to offer new modern designs by prewar designers.

England's 2,000 factories, employing an average of 50 men each, were still turning out "utility furniture" in 1946, but were hopeful that supplies of hardwoods, most of which had to be imported from America and Africa, would soon increase so that the rigid regulations could be lifted and the rationing of furniture and regulation of designs and materials could be ended. The British factories had a large backlog of business to refurnish homes bombed out during the war, and manufacturers were eager also to recover their lush Latin American trade. U.S. factories never had exported much furniture except to Canada and Mexico and, with the U.S. public buying every piece that could be turned out, U.S. furniture makers were not as concerned about foreign trade in 1946 as were the British.

The Canadian furniture industry, comprising 600 large and small factories, enjoyed great prosperity throughout the war and at its close was producing more furniture than ever before, because of a plentiful supply of hardwoods. In Mexico the industry grew rapidly and promised to become a prime competitor with the European industry in Latin American trade. The number of Mexican factories was estimated to exceed that of Canada.

Except in the U.S., the attention of furniture manufacturers was turned toward the U.S.S.R. at the close of the war. With unlimited supplies of hardwoods and manpower, the furniture industry was expected to grow rapidly there, although the U.S.S.R. suffered heavily from

AA'

the war and might need all the furniture it could produce at home and in the countries it controlled.

Throughout the world, there was a great shortage of furniture in 1946 which, it was estimated, would require five to ten years to fill completely. But factories were springing up in every country to meet this unprecedented need, and furniture makers everywhere were wondering how long it would be before world-wide competition in furniture supplanted the conditions that existed before the war. (See also Interior Decoration.)

(J. A. G.)

Furs

The United States fur industry became, in the period 1937 to 1946, financially strong and more influential as a factor in the world's fur trade. Like many U.S. industries it passed through great difficulties during the decade, yet its setbacks were nearly always followed by a forward movement in development and expansion.

The industry advanced particularly in the technical aspect of its business and led the world in the processing, dressing and dyeing of skins, one feature being the bleaching of dark fur skins to take light colours.

Great progress was made in the production of fur-bearing animals on farms. In 1940 a mutation fox, known as the platina fox, which originated in Norway, was introduced into the U.S. market. This type had been sold in Norway and Paris in 1938–39. A collection of several hundred skins from Norway brought record prices; one pelt sold in the raw state at auction in New York for \$11,000, a price never equalled before for a single raw fur skin.

U.S. and Canadian fox breeders began to produce large quantities of beautiful platinum-type foxes. Another mutation, the white-marked silver fox, was also introduced.

In 1939, U.S. silver fox breeders passed through a crisis. The closing of markets in Europe because of war preparations resulted in Norway's and Canada's dumping silver fox skins on the U.S. market. Values declined rapidly, and in 1940 it was necessary for the U.S. government to impose import restrictions which limited the number of silver fox pelts from foreign markets to 100,000 skins a year. This regulation still prevailed in 1946. Production of standard silver foxes in North America and Europe declined during the war years.

Mink farming grew rapidly in the years immediately preceding the war, and for a time ranch mink outranked wild mink. The attack by Japan brought a temporary slump in all fur values, especially ranch mink. The market quickly recovered, however, and during the war years both ranch and wild mink gained tremendously in value. Ranch mink production in the U.S. and Canada reached more than 600,000 skins annually by 1945, and prices mounted to new highs, with \$60 and \$70 not uncommon for ranch and wild skins in the raw state.

In 1944 the first successful mutation mink, a platinumtype, was introduced to the trade. When sold, under the trade-marked name "Silverblu," at auction in New York this mutation brought a top price of \$260 per skin, the highest price ever recorded for any kind of mink. Other mutation minks of different colours were introduced later, but only limited quantities of these skins were available even in 1946. During the war years the U.S. government ceased to publish figures revealing imports and exports of turs and skins. In spite of marine warfare, however, importation of furs continued in limited quantities.

The approach of chaotic world conditions was signalled by the behaviour of the world's fur markets during the years immediately preceding hostilities. World demand for furs commenced to decline in 1936 and continued through 1938; a low point was reached in the skin season of 1939—40. Temporary panic seized the U.S. and Canadian markets following the raid on Pearl Harbor. This condition existed for several months, but as war production got under way the markets revived. Fur apparel by late 1942 was selling so freely that supply could hardly keep up with demand; this condition continued throughout the immediate postwar period.

During the years 1939-45 there was a great change in the marketing of Persian lambskins from Afghanistan, the U.S.S.R. and South-West Africa. Before the outbreak of war in Europe, these lambskins were shipped to London and sold at public auction. The war prevented this trade. Skins were shipped to New York and in 1940 were sold for the first time in America at public auction in the raw state. New York from 1940 to 1946 was the Persian lamb market for the world, and the article became one of the most favoured furs with the American public.

The U.S. and Canadian markets consumed the bulk of the world's Persian lambskin production during the war years. Of all furs entering the U.S. trade during that period, Persian lamb was the most valuable as well as one of the most plentiful. Gray Persian lamb became very fashionable in 1944-45 and often surpassed in value corresponding quality in natural black Persian.

After the lifting of OPA price restrictions, Russian Persian sold at auction as high as \$25 per skin in the raw, Afghanistan Persian up to \$23, and South-West African as high as \$21.

Muskrat was one of three ranking furs in demand during the decade 1937-46, and because of its abundance and modest price retained its popularity year after year. In addition to domestic pelts, the U.S. consumed large quantities of Canadian, Alaskan and Russian skins.

In 1938 U.S. fur dyers commenced to dye muskrat skins mink and sable shades. The article caught on slowly, and mink- and sable-dyed muskrat coats sold for as little as \$117 retail. By 1941 the article had been greatly improved in appearance, and fur manufacturers made coats from let-out muskrat skins which closely resembled mink. The workmanship increased the cost of the garment, and prices rose steadily until in 1946 New York shops were selling mink- or sable-dyed or blended let-out muskrat coats for \$800 to \$900 plus tax.

In 1945 it was possible to obtain large quantities of South American, African and domestic lambskins, which when processed, dressed and dyed, make the so-called mouton fur. During the war these shearlings were used to manufacture flying suits for the U.S. air corps.

Mouton originated in Hungary about 1926 and was known by the trade name "Pannomia." From the continent it found its way to England, where it enjoyed great vogue. Its manufacture in the U.S. was started in a limited way by one firm which obtained Hungarian patent rights to the article. In 1941 a patent was granted to another firm by the U.S. government for what was described as a new method of processing lambskins into mouton. This patent enabled many new firms to undertake the production of mouton.

In the 1945-46 season mouton garments were in abun-

dant supply and available in various colours. It was inexpensive and filled a popular demand for a warm, hard-wearing garment. It was one of two furs remaining under OPA price control in 1946 and sold at retail for as little as \$100.

In 1938 the U.S. entered into a "most-favoured-nation" agreement which reduced the import duty of silver fox from 50% to 371/2% ad valorem; the duty on dressed furs, with a few exceptions, from 25% to 15%; and the duty on dyed furs from 30% to 20%.

The fur trade came under control of the Office of Price Administration in 1942. The price of furs, by their nature, was difficult to control. OPA insisted it could be done; numerous regulations were issued and committees appointed. A great black market developed. Control was impossible among trappers and country collectors. OPA established prices in skins and fur apparel many times, but prices increased in spite of prosecutions and fines. In 1946 mouton and rabbit furs remained under control.

On Oct. 1, 1941, the U.S. government placed a tax of 10% of the retail price on all articles of fur, or articles trimmed with fur where fur was the part of the garment of chiel value. The tax was increased to 20% on April 1, 1944. These taxes produced considerable consumer resistance at first but it did not last long. The revenue obtained by the government from these emergency taxes was as follows, according to the U.S. bureau of internal revenue: 1942, \$36,657,295; 1943, \$54,925,218; 1944, \$68,814,902; 1945, \$88,775,140; 1946, \$40,301,281 (first 6 months).

Great Britain.—During the war years 1940–45, the London fur market ceased to operate. Throughout that period the Hudson's Bay Co., held its auction sales very successfully in New York. Eastwood and Holt, another famous London fur auction company, opened a New York branch in 1940 and marketed great quantities of South-West African Persian lambs. A number of London firms moved to New York and continued in the fur business for the duration.

One of the London areas bombed by the Germans was the fur district; whole blocks were devastated. Members of the fur trade in London entered the various services, and a few of the older members "stuck it out," even though they were compelled to move their offices outside the city to operate.

In 1945 and 1946 British merchants were allowed to import furs, provided they re-exported most of them in one form or another in order to provide foreign revenue for Great Britain. The British fur trade in 1946 was producing limited quantities of cheap fur apparel for home consumption.

The Hudson's Bay Co. returned its fur auction business to London in early 1946 with large offerings of skins. The demand from England and the continent was limited, although prices obtained for skins were high. London, however, had taken the first step in the restoration of its world-famous raw fur market.

China.—China exported millions of dollars worth of weasels, kolinsky, lambskins and kidskins to U.S. and European fur markets prior to the Japanese invasion of Manchuria and China. Shipments declined rapidly as Japanese occupation became widespread and had practically ceased by 1941.

It is noteworthy that furs and skins were about the first Chinese export after Japan surrendered; U.S. firms started receiving shipments from China early in 1946. The trade welcomed these renewed shipments of various Chinese furs.

The revival of the fur business in Japan was equally prompt. During the winter of 1945–46 Japanese traders

Luxury furs shown in 1946 included the royal kohinur and the royal pastel, both mutation minks. The latter was introduced in Seattle, Wash., and first placed on the market in 1946

assembled limited quantities of furs such as mink, marten, weasel, etc., and they found their way to the U.S. It was reported that they came via China and were not openly offered in the U.S. market as Japanese furs, but as Chinese and Asiatic furs.

Soviet Union.—From 1936 to 1939 fur business in the U.S.S.R. was active, and great quantities of raw and dressed skins were sold to the world by contract and through public auction sales in Leningrad. The soviet government transacted a fur business totalling an estimated \$60,000,000 to \$100,000,000 a year. The U.S. and Great Britain were the largest consumers of Russian furs. The soviet government endeavoured to build up its fur dressing and manufacturing business.

Some Russian furs reached the U.S. throughout the war. No statistics were published, but in 1945 large quantities of Russian furs commenced to reach the U.S., and in 1946 shipments were also sent to London.

Canada.—The U.S. continued to be the largest user of Canadian furs and purchased the greater part of the annual Canadian crop, which varied from around \$15,000,000 a year up to approximately \$30,000,000 in 1945. In the war years Canada sold nearly all her furs in the U.S., and filled most of the import quota on silver fox. Canada imported U.S. furs to a limited extent, also certain foreign furs such as Persian lamb. Prior to the war, London was the principal marketing centre for Canadian furs, and in 1946 auction sales of these furs were resumed. During the decade, steady progress was made in the development of fur farming in Canada, which received new impetus with the war's end.

India.—The popularity in the U.S. for Persian lamb in turn created a demand for Indian lamb. This fur had received only limited interest prior to 1940. Its curly pattern made it a substitute for the more expensive Persian lamb. U.S. fur dressers and dyers improved their technique greatly in processing this fur during the period 1940–45. India also supplied the U.S. with quantities of kidskins, stone marten and marten from the Himalayas.

Australia and New Zealand.—Prior to the Pacific war, Australia and New Zealand were large suppliers of rabbit and opossum skins to the U.S. and European markets. The war curtailed the shipments of these and other skins.

In 1945 the rabbit skin market was unfavourably affected in the United States by the growing popularity of mouton. During World War II, Australia used a considerable part of her rabbit catch for the manufacture of felt hats for troops and civilians.

France—France and the U.S. carried on an active fur business before 1939, and Paris designers and manufacturers of fur fashions were influential in the fur fashion world. France imported some North and South American furs and exported rabbit, baum and stone marten to the U.S. Because of government regulations, France was able to import only limited quantities of furs in 1946.

South America.—During the years 1936 to 1941, the U.S. enjoyed a steady fur business with many South American countries. Exports from these countries were curtailed during the war. Prices of South American furs advanced and reached a peak in the U.S. in the winter 1945–46, attributable in part to increased demand for these furs in their native countries.

Scandinavia.—Trade with the Scandinavian countries increased during prewar years, especially in farm-bred furs. When Norway was invaded, silver fox pelts produced annually totaled around 1,000,000 skins. Production in Sweden reached a high point of about 400,000 silver foxes in 1939. Throughout the war Sweden exported furs to North and South America whenever possible. Norwegian furs re-entered the fur trade in 1946 when an offering of blue foxes was sold in New York. Fur farmers of Norway imported North American mink and silver foxes for breeding purposes. Denmark's fur farming increased greatly during the German occupation.

Alaska.—The Alaskan fur trade was maintained during the décade at around \$2,000,000 worth of skins a year. Some years the catch showed a decline, but the tendency was for it to increase. During the war it fell off. The Alaska seal-skin catch was interrupted during 1943 by war activities in the Alaskan and Bering sea area. The seal herd was reported to have passed 2,000,000 in 1944. (W. J. Bt.)

Galen, Clement August von

), archbishop of Muen-Cardinal von Galen (1878ster, was born at Dinklage, Westphalia, Germany, on March 16, 1878. He was ordained to the priesthood in 1904, and was named bishop of Muenster in 1933. One of the most outspoken and fearless of the German opponents of nazi doctrine and practices, he protested whenever Adolf Hitler violated the concordat signed with the Vatican, and condemned the unauthorized "murders" of invalids and the mentally ill. He vehemently denied the charge that all the German people were equally responsible for the atrocities committed during the war. His episcopal palace destroyed by the nazis, he retired to a Catholic hospital at Sendenhorst, where he resided until the end of hostilities. Pope Pius XII proclaimed him a cardinal on Feb 18, 1946.

Gamelin, Maurice Gustave

Gamelin (1872-), French soldier, was the son of a general, born in Paris and educated at St. Cyr. He was chief of staff of Gen. Joseph Joffre in 1914, and in 1917 became commander of a division. In 1925 he was appointed commander of French forces in the Levant. He became chief of the general staff in 1931, inspector general in 1935 and supreme commander of all armed forces on June 6, 1939. His tactics after the start of World War II in Sept. 1939 were based largely upon the defense provided by the Maginot line, and consequently Germany's mechanized war of movement in May and June 1940 found France woefully unequipped to stem the invasion. On May 19, 1940, he was replaced as commander in chief by Gen. Maxime Weygand. Following the fall of France, Gamelin was formally arrested in Nov. 1940 and imprisoned in a detention centre near Riom. Together with Blum and Daladier, he was removed to a German fortress two years later, where he was interned until freed by U.S. troops on May 6, 1945.

Gandhi, Mohandas Karamchand

Gandhi (1869—), Hindu nationalist leader, was born at Porbandar (Kathiawar), India. Educated in the law at London, he began practice in Bombay, but in 1893 went to South Africa. There he became leader of the struggle for civil rights of the Indian settlement. It was in this period that he conceived the tactics of "passive resistance." In 1914 he returned to India, where within seven years he had attained undisputed leadership of the anti-British movement and the stature of a saint (Mahatma, or Great Soul) among the Indian masses. He was delegated full authority by the Indian National congress and was on several occasions imprisoned by the British.

On Jan. 22, 1937, Gandhi announced his retirement from active Indian politics, but by 1940 he was as prominent as ever in Indian affairs of state. The All-India congress on March 20, 1940, delegated to him the direction of negotiations with Great Britain for national independence, and on Sept. 17, 1940, the congress committee elected him its leader. In April 1941 he announced that the congress had temporarily abandoned its aim of independence for India, but he reaffirmed his personal policy of nonviolent civil disobedience. On Dec. 30, 1941, Gandhi

Mohandas Gandhi, acting as adviser at the conference which opened in Simla, India, June 25, 1945, is shown being photographed under protest. British proposals for increased self-government for India ended in failure at this conference

resigned from its leadership and the congress terminated its campaign of civil disobedience. Gandhi's policies during World War II were ambivalent: he did not wish to hinder the British war effort, but neither did he wish to abandon the struggle for independence.

On March 27, 1942, Gandhi conferred with Sir Stafford Cripps, head of a British mission to India, but he rejected the latter's plan for Indian postwar independence, fearing that it might result in the partition of India. On Aug. 9, after the All-India congress party had approved his proposals for a renewed civil disobedience campaign, Gandhi was arrested with 200 other Indian leaders and was held as a political prisoner in the Aga Khan's palace in Poona. During Feb. 1943, he staged one of his longest and most famous hunger strikes, which was accompanied by demonstrations and strikes throughout the country until he was released in May 1944. When the British government announced its plans for an independent India on May 16, 1946, Gandhi and the congress party endorsed the British proposals, participated in the conferences and urged that a united and independent India be peacefully established. Garbett, Cyril Forster

The Archbishop of York (1875-), was born on Feb. 6, 1875, and was educated at Portsmouth Grammar school, Keble college and Cuddesdon, Oxford. He was ordained in 1899 and after various minor appointments became, in 1909, vicar of Portsea,

one of the most important parishes in Great Britain. There he made his reputation as an able organizer, administrator and trainer of junior clergy, displaying in his methods an inflexible discipline. His other dominant interests were housing, education and underprivileged labour. His appointment as bishop of Southwark in 1919 permitted him to acquire a first-hand knowledge of slum conditions. On his appointment in 1932 to the historic diocese of Winchester, Garbett began his famous hiking expeditions, visiting the people in their own villages and homes and earning the reputation of being a great pastoral bishop and diocesan model. He continued these expeditions when he was appointed archbishop of York in 1942. As the representative of the Church of England, he visited Moscow in Sept. 1943 and the U.S. in April-May 1944. His later publications included A Call to Christians (1935); The Church and Social Problems (1939); What Is Man? (1940); We Would See Jesus (1941).

Gas, Natural

The salient features of the production and consumption of natural gas in the United States during 1937-45 are indicated in the table below.

Aside from a 60% increase in consumption after 1937, it is pertinent to call attention to the variations in the types of use. For example, the production of carbon black in 1945 used only a quarter more gas than in 1937, though the output had more than doubled in the meantime. Domestic consumption was on a par with the average consumption increase, but commercial and industrial consumption more than doubled.

It is significant also to note the disposition of the 20-30% surplus of gas produced over and above the amounts sold. In 1919, one-fifth of the gross output was lost or wasted; in 1943, this proportion had been reduced to oneseventh, a significant improvement, but one open to further advance. The most striking feature was the growth of the practice of returning surplus gas to the ground, either to repressure oil fields or for storage for future use. In the period 1937-45, the amount of gas saved in this way increased about tenfold. The procedure was not only an important conservation measure, in that it reduced the loss and waste, but also improved yield of the oil fields.

Gasperi, Alcide de

De Gasperi (1881-), Italian statesman, was born April 3, 1881, in the Trentino, Austrian Tyrol. He was graduated from the University of Vienna in 1905 with a degree in philology. Later he became editor of irredentist journals and in 1911 he was elected by the pro-Italian populace of Trento to the Austrian parliament where he conducted a campaign for Italian minority rights. In 1915 after protesting against Austria's declaration of war against Italy, he was imprisoned for two years.

After cession of the Trentino to Italy by the Versailles treaty, De Gasperi joined the Italian Catholic party and was elected to the Italian parliament in 1921. Upon Benito Mussolini's accession to power, De Gasperi, who opposed fascism, returned to the Tyrol. He was arrested in 1926 and was sentenced to four years in prison for anti-fascist activities. Subsequently, he was given a position in the Vatican library, from which he organized underground opposition to Mussolini. Following the liberation of Rome in June 1944, De Gasperi became minister without portfolio in the first Ivanoe Bonomi cabinet. He was foreign minister in the second Bonomi cabinet and in the succeeding Ferruccio Parri regime and became prime minister in Dec. 1945.

De Gasperi's opposition to the monarchy was more tepid than that of his party, the Christian Democrats, which voted on April 27, 1946, to establish a republic by a three to one majority. In the national elections of June 3, 1946, the Italian people gave a majority of 2,000,000 votes in favour of a republic and the Christian Democrats became the strongest single party in the newly-elected national assembly.

After the official results were posted, the court of cassation made De Gasperi interim head of state until a president could be chosen. On July 2, 1946, he formed a new government, retaining the premiership and the portfolio of foreign minister.

Gaulle, Charles de

De Gaulle (1890—), French soldier and statesman, was graduated from St. Cyr military college at Paris shortly before the German invasion of France in 1914. Wounded three times during World War I, he was captured by German troops at Verdun in 1916, but escaped and saw further action on the western front and in the near east.

Gen. Charles de Gaulle leading a triumphant throng of French patriots down the Champs-Elysees after the Allied liberation of Paris in Aug. 1944

Gdynia
See Danzig.

During the interbellum period, De Gaulle tried to persuade France to mechanize its armies, but the conservative French general staff preferred to place its trust in static defense. When German mechanized armies skirted the Maginot line and overran France in May-June 1940, the validity of De Gaulle's theories was demonstrated, and he was belatedly named undersecretary of war in Reynaud's cabinet.

With the surrender of the Pétain government to the Germans in June, De Gaulle fled to London, formed the French exile regime, and rallied many French colonies to the Allied cause.

In Sept. 1941 the Free French National council was formed with De Gaulle as its president. He aligned his policy with that of the U.S., Great Britain and the U.S.S.R. and declared his council at war with Japan on Dec. 8, 1941. During the course of the next year the underground factions in France united, accepting the leadership of De Gaulle. After Adm. Jean Darlan's assassination in Dec. 1942, De Gaulle shared power in North Africa with his rival, Gen. Henri Giraud, and on June 3, 1943, the two leaders became co-presidents of the newly formed French Committee of National Liberation. But in November, Giraud resigned, leaving De Gaulle in full control of both the North African government and the French resistance movement. In April 1944 he was made supreme commander of the French armed forces. He returned to Paris after its liberation in Aug. 1944 and was acclaimed by the populace.

On Oct. 23 U.S., Britain, the U.S.S.R. and Canada recognized his regime as both the *de facto* and *de jure* authority for France.

With the defeat of the reich in 1945, De Gaulle attempted to reinstate France as a great power, asserting French imperial claims and the right to participate in international conferences. The French national elections of Oct. 21 were generally interpreted as a victory for De Gaulle's policies, although the communists and socialists emerged as the two strongest parties. On Nov. 6 De Gaulle's leadership was formally recognized when he was elected interim president of the provisional government by the new constitutional assembly. The growing strength of the Left in the assembly, and a united front of socialists and communists favouring the socialization of industry and the strengthening of the legislature at the expense of the executive, resulted in the resignation of De Gaulle on Jan. 21, 1946, and the announcement of his retirement.

Gayda, Virginio

Gayda (1885–1944), Italian politician and journalist, was born Aug. 12, 1885, in Rome. He studied law and political economy at the University of Turin, Italy, and later travelled extensively as a newspaper reporter. He served for a time in the Italian diplomatic corps. In 1921 he became editor of Il Messaggero of Rome, and after Mussolini came to power was given the post of editor of Giornale d'Italia. Under his supervision, the latter newspaper became the mouthpiece of fascism and faithfully reflected Italian foreign office views. Gayda's attitude toward his profession was extremely cynical; he was reported as having once said that a newspaperman's duty was not to tell the truth or the facts, but to write only for the good of the regime.

After the fall of Mussolini in July 1943 Gayda lived in retirement in Rome. The nazi-controlled Rome radio said that he was killed March 14, 1944, during an Allied air raid

Geiger, Roy Stanley

), U.S. marine corps officer, was born Geiger (1885-Jan. 25, 1885, in Middleburg, Fla. After graduating from Stetson university, Deland, Fla., in 1907, he enlisted in the marine corps and was commissioned a 2nd lieutenant in 1909. During World War I he served with the 1st marine aviation group in France. A graduate of the Command and General Staff school, the Army War college and the Naval War college, he directed marine aviation from 1931-35. In World War II, Geiger commanded all army, marine and navy aviation units at Guadalcanal in 1942, commanded army and marine forces on Bougainville the following year, led the expeditionary force that reconquered Guam island in July 1944, and headed marine forces in the Okinawa landings of April 1945. He was promoted to the rank of lieutenant general on June 19, 1945, and three days later was put in command of the Pacific fleet marine force.

Gems and Precious Stones

Except for diamonds (q.v.), the effect of World War II was disastrous in most of the leading gem producing areas. Aside from diamonds, sapphire was the only precious stone having industrial applications that led to increased demand. While the use of sapphire pivot bearings or "jewels," in watches and scientific and technical instruments was greatly expanded by war uses, much of the demand was satisfied by synthetic sapphire, rather than by the natural stone. In the U.S., sapphire production dropped from 20,000 oz. in 1943 to 4,500 oz. in 1944 and was discontinued in 1945. Information was lacking on operations in Australia and India after the beginning of the war.

The gem producing areas of Burma, Siam and Indo-China were presumably operated only to a minor degree if at all while in Japanese hands. Little or nothing was done in Ceylon and Madagascar, as the graphite mines had priority on the labour supply. The Colombian emerald mines were dormant even before the war; the 1945 U.S. imports included 1,085 carats of rough and 106,684 carats of cut emeralds, but nothing was known about their source except that some were Russian; also there was no indication as to whether the product was new production or old, but the valuation was extremely low, indicating poor quality. Early in 1946 it was reported that the remaining emerald stocks held by the Colombian government were sold to a U.S. jewellery firm, and there was a possibility that the mines would be reopened.

Under the wartime conditions, supplies of gem stones other than diamonds were greatly restricted, and markets reacted accordingly. (See also MINERALOGY.) (G. A. Ro.)

448 Genetics

In order to form an estimate of the organisms on which the bulk of the genetic research was done in the decade 1937-46, 869 papers from 3 of the leading genetic publications were tabulated. Of the 522 papers on animal genetics, 2 dealt with the Mollusca, 7 with the Protozoa and the rest were about evenly divided between the Vertebrates and the Arthropods; 202 publications were on the fruit-fly genus, Drosophila, and 204 were distributed to the Vertebrates, man, mouse, domestic fowl, guinea pig, cow and pigeon. The remaining papers were distributed among 58 genera of Vertebrates and Arthropods. The 347 papers on plant genetics were distributed among 105 genera. Indian corn easily led the list with 45 publications; then in the order named came cotton, wheat, Tradescantia, tobacco, evening primrose, tomato, barley, cabbage and clover. These plants accounted for over half the papers published.

While cytology and genetics grew together in earlier years into the important science of cytogenetics, in the late thirties and early forties genetics formed broad and vital connections with biochemistry and with ecology and taxonomy. The union with biochemistry led to important new knowledge of the nature and action of the physical basis of heredity, the chromatin and its ultimate units, the genes. The union with ecology and taxonomy shed new light on the mechanics of evolution, at least at the level of speciation. Radiation genetics, initiated by the remarkable discovery by H. J. Muller in 1927 of the transmutation of the gene by X-rays, grew rapidly during the decade. With the possibilities of the extensive use of atomic energy and the consequent release in high concentrations of radioactive materials, this phase of genetics suddenly assumed a place of first rank in the practical affairs of man. Finally, the new advances in chemotherapy, the sulfa drugs, penicillin and other antibiotics, saw a sudden upsurge in the relative importance of chronic hereditary disease in man, and stimulus toward new advances in human genetics.

Human Genetics.—The discovery of the Rh factor and its implications was the outstanding achievement of the decade in human genetics. Karl Landsteiner and Alexander Weiner discovered that when blood from a Rhesus monkey was injected into a rabbit, an antibody was produced in the rabbit blood which reacted violently with an antigen present in the red blood cells of any Rhesus monkey receiving a transfusion of the activated rabbit serum. These investigators tested the bloods of a large sample of the human race for the presence of the Rh or Rhesus factor. They found that about 85% of the human bloods tested carried the Rh factor; that is, they reacted positively with the activated rabbit serum; and about 15% did not carry the Rh factor and reacted negatively. Individuals with such blood were termed Rh-negative. By 1941, through tests of the bloods of members of 60 families, Landsteiner and Weiner established the fact that Rh was inherited as a simple dominant factor, Rh-negative being the alternative recessive. Subsequent studies by Weiner and E. B. Sohn on 40 additional families corroborated this finding. By the application of a simple statistical technique it was possible to establish that the Rhpositive gene frequency in the white population of the U.S. was about 60%, the Rh-negative gene frequency about

The subsequent discovery of certain secondary effects of Rh demonstrated its great practical importance and intro-

duced theoretical considerations of much interest. For a long time the medical profession had known a disease of the new-born infant termed erythroblastosis foetalis. About one infant in 400 births was affected. The new-born infant was jaundiced, anaemic and oedomatous and frequently died soon after birth. After the discovery of the Rh factor, Philip Levine and his co-workers in 1941 established its connection with erythroblastosis foetalis and showed that the following conditions led to the disease. If an rh-rh woman, Rh-negative, mated with an Rh-Rh or Rh-rh man. Rh-positive, then she might carry a foetus with genetic constitution Rh-rh. In some cases red blood cells of the foetus, carrying the Rh antigen, might pass through the placental circulation into the blood stream of the prospective mother. In her blood Rh antibodies were slowly produced in response to the Rh antigen. Generally the first pregnancy was terminated without mishap. But on a second or third pregnancy involving an Rh-positive foetus, the antibody reaction became so strong that a sufficient concentration of antibody passed through the placenta into the blood of the foetus to cause a violent reaction, including the destruction of many foetal red cells. At birth the child lacked a normal complement of red cells and developed in consequence the symptoms mentioned above. Successful treatment of such cases was then worked out, based on a knowledge of the inheritance of the Rh factor.

While on the basis of gene frequencies it was established that about one in 40 pregnancies involved an Rh-positive foetus in an Rh-negative mother, only about one child in 400 was born an erythroblastotic owing to variations in placental permeability and to the slow accumulation of a dangerous amount of antibody. Racial differences in gene frequencies were found. Negroes showed a higher proportion of Rh-positive genes, and in Chinese and Japanese the ratio of Rh-positive was much higher. As more cross-tests of human blood were made, a complex series of alternative factors, either multiple alleles or pairs of very closely linked genes, were discovered at or near the Rh locus. Rh-negative was recessive to all other factors but the others showed lack of dominance among themselves in heterozygous combinations.

Considerable progress was made in the study of linkage, the relative positions of the genes in the chromosomes, in man. The sex chromosomes, X and Y, contain three regions, one peculiar to the X and not found in the Y, one peculiar to the Y and not found in the X, and a homologous region found in both. By studying the partially sexlinked genes in this homologous region where crossingover can occur between X and Y chromosomes, J. B. S. Haldane was able to construct a genetic map of this part of the sex chromosomes. In brief, the method was to study in family pedigrees of the genes concerned their amount of crossing-over with sex, thus determining their position on the homologous portion of the X and Y in respect to the point where this homologous portion is joined to the non-homologous region. A map of 34 genetic units in length and including seven genetic loci in addition to the o.o point was constructed. Probable cases of autosomal linkages began to be reported.

J. V. Neel and W. N. Valentine showed that the rare blood disease, thalassemia, fatal in infants unless given transfusions, was due to an incomplete recessive. They reported on the blood picture of the heterozygotes. W. G. Lennox, E. L. Gibbs and F. A. Gibbs found the electroencephalograms, brain waves, in monozygotic twins to be markedly similar in character. A brain wave pattern, inherited as a dominant, was found to be associated with a predisposition to epilepsy.

Higher Animals.—The progress of linkage studies in Vertebrates was marked by the publication in 1940 by F. B. Hutt and W. L. Lamoreux of linkage maps for 6 of the 40 chromosomes of the domestic fowl. Twenty-one mutant genes were located, and the linkage data gave a total of 270 map units. In 1945, C. C. Little and colleagues published linkage data on the mouse with linkage maps for 10 of the 20 chromosomes and a total of 29 gene loci. Several of these loci contained known multiple allelic series. The total map distance was 204. These data indicated that fowl and mouse chromosome maps when completed would prove to be much longer than those of the *Drosophila* species studied.

In the field of biochemical genetics M. R. Irwin, R. W. Cumley and L. J. Cole studied antigens present in the red blood cells of several species of doves and pigeons. They found through species cross-tests that species A and B might differ from each other in certain antigens, while they shared in common other antigens not found in species C. In hybridization experiments they demonstrated that these antigens were gene determined. Their work lent support to the theory that the individual gene produces or conditions one primary chemical product.

In evolutionary genetics rapid advances were made, particularly on the genus *Drosophila* in studies of the genetic structure of populations within a species and evolutionary divergence at the sub-species and species level. Sewall Wright continued to lay the theoretical foundation for studies in experimental evolution by the publication of papers on the mathematics of micro-evolution, dealing with such factors as mutation rates, mating systems, population size and fluctuation, isolation and gene frequencies within populations.

Theodosius Dobzhansky and colleagues carried on a series of notable investigations on populations of Drosophila pseudoobscura throughout the western part of the U.S. and in Mexico. They showed that certain chromosomal inversions in this species had become widespread in nature and demonstrated seasonal differences in the frequencies of these gene arrangements, interpopulation differences and in some cases large scale geographical clines in their distribution. They also made an extensive study of lethal gene frequencies in populations of this species from season to season and year to year. N. P. Dubinin, R. L. Berg and others made extensive studies on populations of Drosophila melanogaster in Russia, dealing particularly with lethal gene frequencies and the significance of their distribution and fluctuation in numbers. P. T. Ives carried out a similar investigation of lethal genes in U.S. populations of this species and found some populations with most of the flies carrying lethals in heterozygous form.

A. H. Sturtevant, Theodosius Dobzhansky and others reported cases of evolutionary divergence at the incipient species level in *Drosophila*. By far the most extensive study in this field was reported by J. T. Patterson and colleagues. They made extensive collections of the Drosophilidae of the U.S. and Mexico, and described many new species. By laboratory breeding studies they demonstrated upwards of 50 different species or sub-species crosses. Cases ranged from complete hybrid sterility to more or less complete fertility of the hybrids of one or both sexes. Various isolating mechanisms were discovered in the course of this work, and it was concluded that the evolutionary mechanism differed somewhat from species group to species group.

Boris Ephrussi and G. W. Beadle transplanted eye discs from larvae of eye-colour mutants of *Drosophila melano*gaster into wild-type larval hosts of the same species. They demonstrated that certain hormones were present in the host under the influence of which the transplant of certain mutant types developed non-autonomously. This transplantation technique was used by other workers to study various species. Many interspecific transplants were made.

In a study of gene action, Curt Stern showed that the mutant gene, cubitus interruptus, in *Drosophila melanogaster* has an effect cumulative toward the wild-type character in haploid, diploid and triploid doses. From reactions of the "ci" alleles in these combinations and in heterozygous combinations with wild-type alleles, he formulated a theory of gene action based on the presence of and amount of a substrate in the cell, combining action of gene and substrate, and efficiency of gene in utilizing substrate. E. B. Lewis demonstrated by combined genetic and cytological studies that the genes Star and asteroid were in a double band at the left end of salivary chromosome II.

By testing natural mutation rate in some 200,000 X-chromosomes of *Drosophila melanogaster* H. J. Muller demonstrated that the rate was two to three times higher in the spermatozoa from young males than from older males. K. Mampell reported a recessive mutator gene in the second chromosome of *Drosophila persimilis* which greatly increased mutation rate.

P. W. Whiting showed that in the wasp, *Habrobracon*, sex was determined by a system of multiple alleles; the female sex was always diploid and heterozygous, while males could be either haploids or diploids homozygous at the sex locus.

Higher Plants.—In the cytogenetics of the higher plants the most spectacular discovery of the decade was that the alkaloid, colchicine, would produce chromosome doubling by arresting mitosis at a point when the chromosomes had split into two sets but before the cell division was completed. Following preliminary experiments by O. J. Eigsti on the roots of several plants, A. F. Blakeslee and coworkers produced chromosome doubling by this means in some 48 species of plants, representing 29 genera and 16 families. Chromosome doubling was induced in roots, leaves, buds and seeds. Many other investigators applied the drug to large numbers of species. The tetraploid plants produced often bore larger flowers, seeds and other structures. The method proved of particular value in plant hybridization studies. Many sterile hybrids between species or even genera could be changed into fertile allotetraploids by the induction of chromosome doubling.

S. C. Harland and B. A. Silow published extensively on hybridization in cottons, dealing with the transfer of genes from one species to another and their expression in the new reaction system. C. D. Darlington and his colleagues studied the mechanics of meiotic cell division in plants, utilizing species hybrids for resolving many of the problems. Barbara McClintock made an extensive study of the behaviour of ring chromosomes in corn. She also reported a series of terminal homozygous deficiencies of different lengths in a corn chromosome and showed that these deficiencies of varying lengths behaved as a series of multiple alleles in heterozygotes. M. M. Rhoades described a gene in corn which caused a high mutation frequency from recessive to dominant at another locus. Using this recessive gene, L. J. Stadler demonstrated that no such dominant mutations were induced by X-rays. He demonstrated a qualitative difference between X-ray induced mutations and those produced by exposure to ultra-violet light. Stadler concluded that at least in corn, X-ray mutations are chromosomal deficiencies and not point mutations. Ex-

periments by Karl Sax and others on chromosome aberrations in plants following X-ray treatment indicated healing of chromosome breaks following radiation. Consequently a time factor was involved in the application of a given dosage and its effect in producing multiple break aberrations.

Lower Organisms.—Biochemical genetics developed rapidly during the decade, particularly through studies on lower organisms, moulds, yeasts, protozoa, algae, bacteria and viruses. Only a few of the significant advances in this field can be mentioned here. The interested reader is referred to G. W. Beadle's excellent and comprehensive review "Biochemical Genetics" in *Chemical Reviews*, 37:15–96 (1945).

Franz Moewus discovered many natural gene mutations in the tiny unicellular alga, Chlamydomonas, and induced others by radiation. He worked out extensive chromosome maps for the species. A number of the genes reported were considered by Moewus and R. Kuhn to control specific steps in biochemical reaction chains leading to hormonal end products. Mutants of these genes produced blocking of the chain of reactions at certain levels. A specifically gene controlled motility hormone was discovered which in one species induced the rapid growth of flagellae on previously immotile cells in concentrations as low as 1.2 molecules per cell. Five allelic genes at the female determining locus and five at the male locus were each shown, when cells were grown in the light, to initiate a chain of reactions leading to production of two isomeric forms of a chemical end product in a fixed ratio.

Filtrates containing each of the ten hormonal mixtures, known as gamones, changed sexually inactive cells having the same allele as those producing the filtrate into sexually active forms.

G. W. Beadle, E. L. Tatum and associates assumed that if specific steps in chemical syntheses were controlled by specific genes, it should be possible to find mutations which would block these syntheses at different levels. Following heavy X-ray dosages, single spore cultures of the bread mould, Neurospora, were grown on media enriched with substances normally synthesized by the fungus. Subcultures of some of these strains would not grow on minimal media. By further subculturing on partially enriched media the compound which the mutant strain was unable to synthesize was eventually identified. Different mutations, each blocking the synthesis of one of seven vitamins and of one of eight amino acids, were found. By further tests in certain cases mutants were discovered which blocked specific steps in the chain of reactions leading to the end product. Thus at least three gene controlled step reactions were demonstrated in the normal synthesis of the amino acid, arginine.

T. M. Sonneborn found two different types of *Paramecium*, "killer" and "sensitive." Sensitive races were killed when introduced into culture medium in which killers had been grown. The killer character was found to be conditioned by a cytoplasmic factor, "kappa." The kappa substance was produced only in the presence of a dominant nuclear gene, K. This gene was unable to initiate the production of kappa. However, if a little of the kappa substance was introduced into a genetically K individual lacking it, the cytoplasmic factor was then produced indefinitely in this animal and all of its descendants possessed the K gene.

In corn Rhoades reported a somewhat similar case of gene influenced cytoplasmic inheritance, and P. Michaelis

found plasmagenes transferred in species crosses in the plant, Epilobium. S. Spiegelman, C. C. Lindegren and G. Lindegren discovered a gene in yeast which produced an enzyme able to hydrolize the sugar, melibiose. Once formed, this enzyme was self perpetuating in the presence of a melibiose substrate, even if the original gene initiating its formation was replaced by one incapable of producing it. In a strain of the bacterium, Escherichia coli, sensitive to a given bacterial virus, S. E. Luria and M. Delbruck found many mutations to resistant types. Later they discovered mutations in the bacterial virus capable of attacking the mutant strains resistant to the original virus.

Much of the genetic work on lower organisms indicated that an individual gene initiated or controlled one specific chemical reaction, and that primary gene action was unitary rather than multiple. (See also BIOCHEMISTRY; BOIANY; CHEMISTRY; CHEMOTHERAPY; CHEMURGY; VITAMINS; ZOOLOGY.)

Geography

The decade 1937-46 was an eventful one for professional geographers. When World War II began, government officials charged with planning and directing the policies of nations, as well as the reading public, suddenly wanted the kind of information and analyses that geographers could supply. They wanted to know about a great many places they had scarcely heard of before. Geographers, at war or in peace, were busily engaged in describing the differences, physical and human, which exist from place to place, in devising more effective methods of identifying and presenting these differences and in trying to show the importance of them in human affairs. In ordinary times the public had been bored with geographic detail, unless it had been brilliantly coloured by the pen of a Harry Franck, or depicted as a background for bathing beauties. At the beginning of the decade, even in the schools, future citizens were being trained with only elementary concepts of geography. And then, suddenly, the kind of work geographers do was in demand.

Before World War II.-For the English-speaking peoples on both sides of the Atlantic, the decade of the 1930s which culminated in the outbreak of World War II was marked by a series of increasingly serious emergencies. Many geographers were directing their studies and writings toward the pressing problems of the moment. There were problems of employment, of the conservation of resources. of the planned use of land both rural and urban and many others. There was an increasing need for detailed information about soils, slopes, water and the record of man's experience with the utilization of these things in specific areas. Some geographers were engaged in land inventories; they prepared detailed maps of the physical and human factors deemed to be significant in specific areas, and they wrote reports analyzing the facts they had shown on maps in terms of the economic, political or social problems of the area. Others were devising and testing techniques for the rapid collection of important data in the field, and for

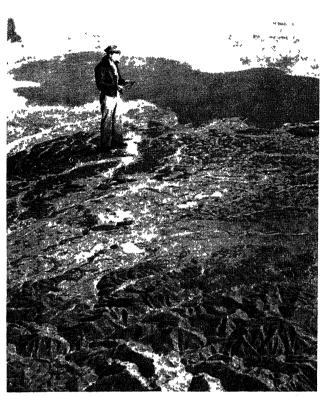

the effective marshalling of these data for the use of the planning officials.

In Great Britain the Land Utilization survey had been established in 1930 and had completed a major inventory in great detail of the lands and kinds of land use in England, Scotland and Wales. In 1936 the survey had become an independent organization whose financial support came from the public sale of its maps and reports and the donations of its patrons. The survey had established its importance in providing the basic data necessary in any planned readjustment of rural or urban land use. It provided, moreover, a model of organized co-operative effort in a capitalist society, making use of the services of great numbers of untrained persons under the supervision of professional geographers.

In the United States this phase of geographical work was carried on by a great variety of agencies and was, on the whole, less complete than the British survey. The Tennessee Valley authority had included a staff of geographers to carry out an inventory of the physical properties of the land and of the nature of the land use, and to study other specific problems related to the work of the authority. The national resources planning board, through a subcommittee of its land committee, described a new procedure for the rapid analysis of the employment situation in an area of county size, and for the preparation of a series of recommendations pointing to the possible readjustments leading to fuller employment or more effective use of local resources. This procedure, published as Technical Paper 6 of the national resources planning board (Area Analysis, A Method of Public Works Planning, 1943), was tested in the actual field survey of a variety of areas. The land committee also made a study of existing practices in land classification throughout the United States (Land Classification in the United States, 1941). The soil conservation service carried out experiments in the detailed field analysis of water run-off and soil erosion. Among the projects set up one was designed to measure the incidence of rainfall at 15 minute intervals during the passage of single storms over a small area, and the effect of different kinds of vegetation cover on the resulting run-off. Much new light was thrown on the conditions leading to land destruction and to floods. In many states, and in Alaska and Puerto Rico, geographers were employed to study many aspects of the problems of land use and resource conservation.

During this time the American Geographical society of New York was continuing and bringing to completion its "Millionth Map of Hispanic America." This undertaking, begun nearly two decades earlier, involved the collection and evaluation of all available maps and surveys for different sections of Latin America, the actual field survey of parts where no existing maps were adequate and the compilation of the results on a map on the scale of 1/1,000,000, conforming to the standards of the International Map of the World. These maps, and others derived from them, provided an indispensable tool for all further geographic research in this area.

Not all the professional geographers in the United States, however, were directing their research studies to these local practical problems. A small number were specializing in the study of foreign regions. Through periods of foreign residence they were gathering material for numerous books and articles and preparing themselves to speak with authority concerning problems and conditions of specific regions. With few exceptions, they were working in Latin America or Asia. Others were investigating such problems as the origin of the maize plant, or were de-

A huge miniature of Japanese military targets, built on a scale of one foot to the mile. From this and similar stage sets, motion pictures were made for briefing B-29 pilots in the bombing of Tokyo, Nagasaki, Hiroshima and Yokohama

veloping the concepts of political geography. A very considerable proportion of the time of the geographers in universities was given to the writing of text books.

Geography in World War II.—The beginning of World War II immediately increased, and for the most part redirected, the work of professional geographers. One important result of the pre-war emergency, at least in the United States, had been a steady increase in the number of graduate students specializing in geography. When the time came to staff the new war agencies there were not nearly enough established professional geographers either in Great Britain or in the United States to occupy the positions where geographers were needed. Of the hundreds of geographers who worked in British and U.S. civilian war agencies or on the research staffs of the army or navy, the larger proportion were men and women who had not completed their graduate training. Even college undergraduates who had had some courses in geography were given further rapid training and set to work. And not a few who had had no previous contact with the field were also used.

There were at least eight chief kinds of research work performed by geographers during the war. These were:

Detailed Regional Surveys.—Geographers on both sides of the Atlantic were employed in research agencies to compile detailed regional or country monographs. The purpose of these monographs was to bring together in readily usable form for nongeographers the essential information about an area needed by the military, naval or civilian authorities for strategic planning. They included a variety of kinds of information: detailed descriptions of terrain,

beaches, vegetation cover, climate, water supply, transportation and communications facilities, industries and resources, towns and ports, characteristics of the people, political and economic organizations and many other details. Geographers contributed well over half of the material in these books, and the responsibility for over-all editorial supervision was, in most cases, placed on professional geographers. There were several important series of such monographs.

Resource and Commodity Surveys.—In several of the war agencies dealing with economic problems, geographers made important contributions. Unlike World War I, however, in which studies of production, consumption and trade by countries were made in considerable part by geographers, in World War II such studies were largely done by economists. In some instances, however, geographers were used for the preparation of specific studies on topics concerning which they could speak with authority, or they worked with economists especially on problems requiring a knowledge of the details of distribution. In Britain the maps of the Land Utilization survey were used for the wartime re-arrangement of agriculture, the placing of camps and airfields and many other purposes.

Cartography.—A major contribution was made in the field of cartography. Partly in connection with the regional studies, partly separate from these, geographers were called upon to present in map form many facts of a regional, as opposed to a topographical or local, importance. Entirely new techniques of cartographic representation and reproduction were devised. (See Cartography.)

Topographic Models.—Another field in which geographers played a most important part was in the production of topographic models on a regional scale. Here again entirely new techniques were devised which permitted the construction of models of large areas with much greater precision of detail than had ever before been possible.

Air-photo Interpretation.—A few geographers in the United States did important work on the development of the wartime techniques of air-photo interpretation. (See also Photography.)

Map Intelligence.—Before the war no systematic record was available of the published or manuscript maps of foreign areas. The American Geographical society (see Societies and Associations) had recorded the available sources for Latin America, but other parts of the world had no such coverage. Under the pressure of global war, professional geographers in the United States established such a survey of map sources. The work involved the search for maps in the files of government agencies and private businesses at home and abroad. It involved the description and systematic cataloguing of the maps, and the development of new methods of map evaluation.

Climatic Studies.—Geographers were employed in several branches of the U.S. army and in the United States weather bureau on climatic studies. The planning of warfare in widely scattered and diverse parts of the globe required more detailed information than had previously been available regarding the average weather conditions likely to be encountered. Studies of the development of new uniforms and other equipment adapted to use under various climatic conditions were made; new climatic categories and new maps were prepared.

Geographic Names.—The war gave new prominence to the work of the board for geographic names in the United States department of the interior. A large staff studied foreign maps and prepared gazetteers of place names. In addition to these kinds of research undertaken by geographers, a few members of the profession occupied administrative posts where their training in handling many aspects of regional problems perhaps gave them special aptitude for the planning, supervision and co-ordination of research.

But not all the geographers who worked long hours in war service during this emergency period were in war agencies. Those who remained at the universities were also called upon for unusual tasks. During the war, U.S. universities were crowded with students in the army specialized training program, working in pre-meteorology, in one of the several area and language programs or on other types of study devised to fill the need of the armed services for men and women with special knowledge of certain areas or certain techniques. For most of these programs one or more courses in geography were required. With staffs seriously depleted, the remaining teachers had to carry a heavy burden of class work, and in addition had to recruit and guide their less urgently employed colleagues in methods of geography instruction. As a result of these instructional programs, a much larger proportion of college students were given some contact with elementary geography than would have been the case under normal conditions.

After the War.-With the conclusion of World War II the demand for professional geographers in the United States continued to exceed the supply of trained persons. On both sides of the Atlantic many young men with war training in geographic research returned to take some of the new positions available. Although the war agencies were greatly reduced or entirely disbanded, new government positions in the "old-line" agencies became available for geographers. There were both federal and state agencies in the fields of land planning, reclamation, conservation, applied climatology, intelligence work in foreign areas, cartography, map intelligence and many other topics. Private business, too, was providing an opportunity to test the value of geographic studies in such fields as the evaluation of cargo or passenger potentials for air lines, or the location of retail stores. Many new geography departments were established in colleges and universities, and older departments were enlarged.

* * *

Geographers did not pass through this eventful ten-year period without developing or modifying certain of their concepts. The very old discussion of the relative merits of the topical and the regional approach continued throughout the war, with frequent reorganizations of war agencies first in one direction then in the other. Ever since Bernhardus Varenius there had been topical, or systematic geographers, who devoted themselves to a study of specific topics such as climate, soil, transportation, industrial location or political geography; and there had been regional geographers, who devoted themselves to the study of the various aspects of one area or region. The war experience showed clearly that both kinds of approach were needed. but it also showed that whereas the normal three or four years of graduate training could develop a reasonably competent topical specialist, a much longer period of time was required for the development of similar regional competence.

The war experience also suggested that geographers should pay increased attention to cartography. This did not mean the kind of topographic surveying that engineers are called upon to make. It means that geographers had become especially responsible for the use of maps in the

analysis of problems in which relative location, area or shape were of importance. In the war agencies economists, historians, political scientists, geographers and others learned, sometimes painfully, to work together. Four fundamentally different methods of attacking problems appeared: a documentary method, a statistical method, a method of case study and a cartographic method. Geographers, as well as other social scientists, used all four methods; but geographers, more than any of the others, were charged with the development of cartographic methods and techniques. At the end of the decade the question remained unanswered whether this wartime co-operation would have permanent effect in bringing the social sciences closer together without the loss of the distinctive contribution each of them could make to their common social, political or economic problems. Geographers, looking to the future, were strengthening their cartographic staffs, and had become more clearly conscious of their distinctive place among the social sciences. (See also CARTOGRAPHY; GEOLOGY; GEOPOLITICS; PHOTOGRAPHY.)

BIBLIOGRAPHY.-Among the outstanding books published during the period 1937-46 the following may be listed as generally representative of professional geographic writing: Richard any representative of professional geographic writing: Richard Hartshorne, The Nature of Geography (1939); Derwent Whittlesey, The Earth and the State (1939); Samuel W. Boggs, International Boundaries (1940); Preston E. James, Latin America (1942); Robert S. Platt, Latin America, Countrysides and United Regions (1942); Ralph H. Brown, Mirror for Americans (1943); George B. Cressey, Asia's Lands and Peoples (1944); Glenn T. Transfer Medical Maintenance of Trewartha, Japan (1945); Ellsworth Huntington, Mainsprings of Civilization (1945).

Geology

Great strides were made in the science of geology during the decade 1937-46 in spite of the retarding influence of World War II. While there was a noticeable reduction in the writings devoted to pure geology and considerable destruction of educational and geological survey facilities and of libraries and museums, this was compensated for somewhat by the volume and quality of the literature in applied geology. In the United States two important geological magazines-the Journal of Geomorphology and the Pan American Geologist-were discontinued. Several periodicals devoted to geology in the war-ridden countries of Europe and Asia also ceased publication, and many others had an uncertain and irregular distribution.

After the very successful meeting of the International Geological congress in Moscow in 1937, further conventions of this organization were discontinued because of the war.

The regular annual meetings of geological organizations over the world were also generally discontinued during the war years.

On the more favourable side of the picture were the following:

- 1. The great awakening to the importance of research in geology, stimulated by the development of atomic energy and by the establishment of the Penrose fund of the Geological Society of America and other research funds.
- 2. The realization of the need for conservation not only of soil, but also of mineral wealth in general.
- 3. The increasing application of geology in mineral explora-tion attendant upon the world-wide search of strategic min-
- erals by the nations at war.

 4. The greater application of geophysics as a tool of the
- geologist.
 5. The rapid rise of aerial photography and its applications in cartography and geology.
 6. The recognition of the need of a parent geological organization in the United States which might wield a greater influence in national affairs. Plans were under way at the end of the decade for the founding of the American Geological Institute.

- The trend of geology toward a more quantitative science and the development of applications to many new fields.
- The fuller appreciation, though considerably delayed in the United States, of the value of the application of geological
- knowledge in the successful conduct of military operations.

 9. The increasing interest on the part of both educators and applied geologists in the improvement of the curricula in geology and geological engineering in the educational institutions. Greater emphasis was placed upon a stronger background in field geology, mathematics, physics, chemistry and basic engineering, and upon the completion of one or more years of graduate study before entrance into the fields of pure and applied geology. Greater effort was also made to encourage more promising students to enter the earth science professions rather than to specialize in physics, chemistry and certain other better-known branches of science.
- 10. The greater success in educating the layman to the importance of the science of geology in national welfare.

 11. The accumulation of a wealth of data on subsurface
- geology, paleogeography and related subjects derived especially from deeper drilling for petroleum and natural gas in proved areas and from exploration work in general. There was a trend toward the evaluation of this information and its co-ordination with that accumulated from other sources over the years. Many valuable contributions to geology were resulting from this pro-

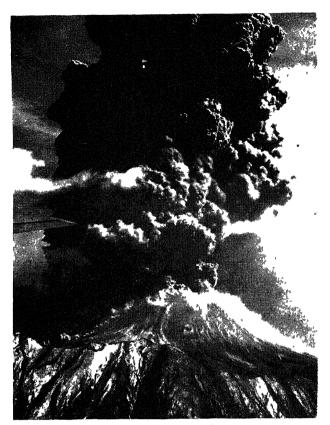

Because of the extensive diversion of geological personnel and of students majoring in geology to the armed forces and to the exploration for and development of strategic minerals, there was a dearth of geologists during the war years both in pure and applied fields. This scarcity was alleviated to a considerable extent by the return to their normal occupations of veterans and others so diverted and of a large number of former students in geology to the educational institutions. However, it was anticipated that there would be a serious shortage of geologists over the world for a number of years to come. This situation would be aggravated by the need for more than the usual amount of exploration work required to replenish greatly depleted reserves of minerals heavily drawn upon during World War II. It was estimated by competent authorities that the mineral production of the world during the years 1916-46 was equal to that taken from the ground in the whole previous history of mankind.

The records of the Office of Scientific Personnel of the National Research council indicated that, as of Dec. 31, 1944, there were 440,000 registrants. Of this number, geologists and geophysicists constituted 1.9%.

A new international organization entitled Pan American Institute of Mining Engineering and Geology (P.A.I.M. E.G.), was organized. The first meeting was held at Santiago, Chile, in Jan. 1942. By 1946, seven countries-Argentina, Brazil, Bolivia, Chile, Peru, Uruguay and the United States of America-had established national sections of the organization.

Dictionaries and Histories.—The appearance of the "Lexicon of Geologic Names of the United States (Including Alaska)," by M. G. Wilmarth as a Bulletin of the U.S. Geological survey in 1938 constituted a boon to geologists. Other gaps in geologic literature were filled in 1945 by the Dictionary of Geological Terms, by C. M. Rice and the Diccionario y Nomenclatura Geológica en Castellano, Alemán, Ingles, by Heriberto Windhausen (Argentina).

The Birth and Development of the Geological Sciences came from the pen of Frank D. Adams in 1938. In celebration of the half-century mark in its history, the Geological Society of America published in 1941, as a special volume, Geology, 1888-1938. This contained reviews of developments in each branch of geology and paleontology and in mineralogy and exploratory geophysics during that period by competent authorities in each field.

Eruption of Mount Vesuvius in 1944. The volcano became active on March 18 in a major outbreak, spewing lava, gas and ashes until March 24, when it subsided again. Several Italian towns in the path of the lava flow had to be evacuated

Oceanography.-Progress in the geological aspects of oceanography were high-lighted by the development of new techniques in sounding which revealed startling facts regarding the topography of the ocean floor, as well as in the collection of bottom samples by means of the Piggot gun. Great submarine canyons not previously known were detected on the continental shelves as well as in the bathyal zones. Extensive investigation of these features resulted in the development of a variety of hypotheses regarding their origin. The conflicting interpretations were considered at length by Douglas Johnson in The Origin of Submarine Canyons, A Critical Review of Hypotheses (1939), and by R. A. Daly in The Floor of the Ocean, New Light on Old Mysteries (1942). Geophysical methods were applied to the determination of the thickness and structure of the sedimentary deposits on the continental shelves. Anticipated exploration of the continental shelves for oil and gas rendered this development of special interest.

The results of the survey of the continental shelf off southern California by K. O. Emery and F. P. Shepard, published in the April 1945 Bulletin of the Geological Society of America, revealed extensive areas of consolidated rocks in many cases identical in lithologic character and age to known formations on the mainland. Sedimentation was taking place only in the basins and troughs.

The entire field of oceanography was excellently covered by H. U. Sverdrup, M. W. Johnson and R. H. Fleming in the voluminous work, *The Oceans, Their Physics, Chemistry and General Biology* (1942).

Geomorphology.—A new magazine entitled Journal of Geomorphology appeared in 1938 as a publication of

the Columbia University press under the editorship of Douglas Johnson. This was discontinued in 1942 as a result of the war.

The subject of landslides and related phenomena was covered comprehensively by C. F. S. Sharpe (1938) in a publication of the Columbia University press. Parry Reiche surveyed the subject of weathering processes and products and introduced some new concepts in a 1945 publication of the University of New Mexico.

N. M. Fenneman issued, as the second volume of his two-volume work on the physiography of the United States, Physiography of Eastern United States (1938). A comprehensive work by W. W. Atwood on The Physiographic Provinces of North America (1940) also constituted an important contribution.

During the period 1939-43, four valuable textbooks on geomorphology appeared in the United States. These were by A. K. Lobeck, O. D. von Engeln, N. E. A. Hinds, and P. G. Worcester. A fifth appeared in England by C. A. Cotton.

This branch of geology had definitely come of age, and the term "geomorphology" had displaced to a considerable extent the formerly widely accepted term "physiography."

General Geology.—The appearance of several popular books on geology aided materially in educating laymen to the importance of the science of geology. Among these should be mentioned Biography of the Earth, Its Past, Present, and Future, by George Gamow (1941); Rocks and Rivers of America, by E. W. Shuler (1945); Geology in the Service of Man, by W. G. Fearnsides and O. M. B. Bulman (1944); and Geology for Everyman by Albert Seward (1944). The latter two were British authors.

A stimulating paper by C. G. Croneis entitled "Geology in War and Peace" was published in the July 1942 Bulletin of the American Association of Petroleum Geologists. In the Daly Volume (1945) of the American Journal of Science, there appeared a symposium on 26 topics by 28 authors entitled Problems in Geology and Geophysics. This brought out the newer developments in several fundamental phases of geology.

Physical Geology.—Several revisions of well-known text-books on physical geology appeared during the decade. The literature on this subject was also enriched by several new texts, such as *Principles of Physical Geology* by Arthur Holmes (1945). The possibilities in the application of more quantitative methods in this branch of geology were indicated by the excellent paper of R. E. Horton on "Erosional Development of Streams and Their Drainage Basins; Hydrophysical Approach to Quantitative Morphology," published in the *Bulletin* of the Geological Society of America for March 1945.

In Physics of the Earth, Pt. 7; Internal Constitution of the Earth, a symposium edited by Beno Gutenberg (1939), many basic ideas regarding the fundamental properties and character of the earth's crust and its interior were brought out.

Historical Geology.—Greater attention was given to the preparation of more accurate paleogeographic maps for the different stages of geologic time and of paleogeologic maps, because of the importance of such maps in the exploration for stratigraphic traps for oil and gas. In 1940 A. W. Grabau's The Rhythm of the Ages; Earth History in the Light of the Pulsation and Polar Control Theories, published in Peking, presented an expansion of his original hypotheses brought out in his extended treatises on Paleozoic Formations in the Light of the Pulsation Theory.

Several important articles appeared on the much-mooted

question of the time of appearance of man in North America. The Last Million Years; A History of the Pleistocene in North America, by A. P. Coleman, edited by G. F. Kay, was issued in 1941. A well-written elementary text on historical geology came from the pen of R. C. Hussey in 1944, and a revision of the widely used textbook on historical geology by Charles Schuchert and C. O. Dunbar appeared in 1941.

Sedimentation.—The outstanding contribution to the literature on sedimentation was W. H. Twenhofel's Principles of Sedimentation (1939). Much valuable information was obtained from the study of marine bottom sediments by the Wood's Hole Oceanographic institute and by other similar organizations. The comprehensive work, Recent Marine Sediments, a Symposium, P. D. Trask, editor, published by the American Association of Petroleum Geologists in 1939, supplied a wealth of information on this phase of sedimentation. The soil conservation service of the United States government also made many valuable contributions to the subject of soil erosion and reservoir siltation.

"Sediment-Heft," a symposium (Geol. Rundschan, volume 29), presented the results of European investigations in this field. Geochronologia Suecica; Principles, by Gerard De Geer, published in 1940, treated of geochronology, particularly as revealed by the study of varves and attendant phenomena in the Stockholm region of Sweden. The May 1945 issue of the American Journal of Science contained a valuable symposium on loess presented at the earth science section of the Nebraska Academy of Science in 1944 under the co-chairmanship of C. B. Schultz and M. K. Elias.

Glacial Geology.—A technique based on the depth of leaching of calcareous drifts for differentiating drift sheets and for estimating the relative duration of post-glacial time and of the Illinoian-Wisconsin interglacial interval was developed.

The report of H. W. Ahlmann and his associates (1938) on investigations in Spitzbergen and Iceland furnished valuable information on the physical differences between high-latitude and lower-latitude glacier ice which was of potential value in the development of an understanding of the glaciation of the Pleistocene epoch.

The study of glaciers was aided greatly by the application of seismic methods to the determination of the thickness of the ice and by the use of aerial photographs.

Stratigraphy.—The general realization of the need of the proper appreciation of facies relationships and of the importance of the proper understanding of facies faunas led to remarkable improvements in technique in the interpretation and correlation of geological formations.

The monumental work by Charles Schuchert on Stratigraphy of the Eastern and Central United States (1943) illustrated the value of systematic regional correlations. The committee on stratigraphy of the National Research council (C. O. Dunbar, chairman) sponsored the preparation of a series of correlation charts of the geological systems of the United States, with appropriate explanatory text matter. Many of these were published in the Bulletins of the Geological Society of America.

Structural Geology.—The decade was characterized by many new concepts regarding the constitution of the interior of the earth as revealed by seismic and other evidence; by a veering away from the hypothesis of continental drift as postulated by A. Wegener; by the contribution on the structural behaviour of igneous rocks by Robert Balk, which appeared in Memoir 5 of the Geological Society of America; and by the developments in structural

petrology based upon the study of grain orientation. Memoir 6 of the Geological Society of America, entitled "Structural Petrology," by Eleanora B. Knopf and Earl Ingerson (1938) presented developments in that subject.

The much-cited paper by M. K. Hubbert on the "Theory of Scale Models as Applied to the Study of Geologic Structures" appeared in the Oct. 1937 Bulletin of the Geological Society of America. Strength and Structure of the Earth, by R. A. Daly (1940) embodied a keen analysis of the theory of isostasy.

A tectonic map of the United States, a product of the labour of nineteen members of the committee on tectonics of the division of geology and geography of the National Research council, was issued by the American Association of Petroleum Geologists in 1944. A valuable textbook, Structural Geology, by Marland Billings came from the press in 1942.

Vulcanology.—The compilation of data at observatories on some of the better known volcanoes over the world promised to assist in the solution of basic problems of vulcanism.

The outbreak and development of the volcano Paricutin in a corn field some 200 miles west of Mexico City in Feb. 1943 stimulated great interest in this phase of geology. This was said to be the first development of a volcano whose entire history had been observed and recorded by man. A new committee of the National Research council headed by R. E. Fuller was appointed for the study of the volcano.

Two works on vulcanology of more than ordinary value were *Volcanoes as Landscape Forms*, by C. A. Cotton (1944) and *Volcanoes Declare War*, by T. A. Jaggar (1945). The latter author, as a result of many years of experience at the observatory on Kilauea, wrote with more than an ordinary background.

Petrology and Petrography.—The role of physical chemistry as a tool of the petrologist was exemplified by Paul Niggli's volume (1937) on Das Magma und Seine Produkte; I. Teil, Physikalisch-Chemische Grundlagen. During the ten-year period, the series of four volumes of A Descriptive Petrography of the Igneous Rocks, by Albert Johannsen was brought to completion. This constituted a most valuable reference work. In the Manual of Sedimentary Petrography (1938) by W. C. Krumbein and F. J. Pettijohn, the importance of quantitative measurements of the characteristics of sedimentary rocks was emphasized. Another valuable work on sedimentary petrography was Methods of Study of Sediments by W. H. Twenhofel and S. A. Tyler (1941).

Regional Geology.—Significant in the field of regional geology was the appearance of Volume I of a projected three-volume reference work entitled Geology of North America, edited by Rudolf Ruedemann and Robert Balk (1939). This was of the series Geologie de Erde (Berlin) under the editorship of Erich Krenkel. Eastern North America, including Greenland, was described.

The Geology of China, by J. S. Lee (1939), Professional Paper 192 of the U.S. Geological Survey on Alaska (1939) by P. S. Smith, and Geologia do Brasil by A. I. De Oliveira and O. H. Leonardos should also be mentioned.

Hydrology.—Several new concepts were developed regarding the circulation of underground water, including the encroachment of salt water in aquifers heavily drawn upon in the Atlantic and Gulf coastal plains and the view that the elasticity of fluids in reservoirs and of the reservoirs themselves might play an important role in the

movement of fluids underground as pressure is lowered during production.

There was extensive development of underground water in surface gravels in the Great Plains region for irrigation by pumping. An exhaustive treatise on *Ground Water* by C. F. Tolman appeared in 1937. An important symposium on *Hydrology*, edited by O. E. Meinzer was issued as Part 9 of the National Research council's *Physics of the Earth* series in 1942.

Mining Geology.—Greater emphasis was placed on detailed field observations of ore deposits and on laboratory experiments as an aid in solving problems of mineralization. Probably the most important single contribution to mining geology was Ore Deposits as Related to Structural Features (1942), a symposium by 65 contributors edited by W. H. Newhouse. A. M. Bateman's Economic Mineral Deposits (1942) became widely used as a text and reference work.

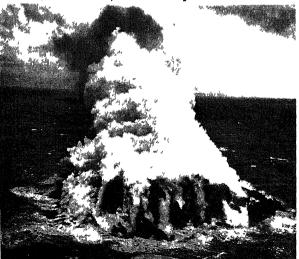

T. S. Lovering's Minerals in World Affairs (1943) and the book by C. K. Leith and others on World Minerals and World Peace (1943) indicated the interest which had developed, in part as a result of World War II, in the international aspects of mineral deposits. In 1946 J. D. Forrester published a book on Principles of Field and Mining Geology which should be a great aid to teachers and students of these subjects.

The discovery and development of an important copper deposit in Vermont lent weight to the view that other important mineral deposits awaited the prospector. In many nations of the world intensive searches for uranium deposits were conducted as a result of the potentialities uncovered by the development of atomic energy.

Sea water, which was drawn on to a limited extent during World War II as a source of certain metals and salts, promised to become an even more important source of minerals in the postwar period.

Petroleum Geology.—During 1938 The Science of Petroleum, edited by A. E. Dunstan and others, appeared as a four-volume work. Volume one relates to origin, distribution, migration, occurrence, exploration, production and related subjects. Stratigraphic Type Oil Fields, a sympo-

Two volcanic islands in the Pacific which first appeared in Feb. 1946, about 200 mi. south of Tokyo; two months later they were reported virtually submerged again. The cloud shown was formed by steam and sulphur fumes rising from the rocks

sium edited by A. I. Levorsen, was issued by the American Association of Petroleum Geologists in 1941.

The necessity of maintaining adequate proved reserves of petroleum and natural gas in the face of the diminishing size and productivity of the newly-discovered oil and gas fields stimulated exploration the world over. There was also noticeable improvement in discovery and development techniques. Geophysical methods, including electric logging and other methods of well logging, were improved and applied on an ever increasing scale. Encouraging aspects were the development of great oil reserves, especially in the Middle East and in Venezuela, and the discovery of petroleum in several countries previously unproductive.

Greater attention was given to the basic problems of petroleum geology. The most important of the fundamental investigations under way in 1946 was Research Project 43, "Transformation of Organic Matter to Petroleum," of the American Petroleum institute under the direction of a committee headed by G. M. Knebel.

In an effort to make the most of known reserves of petroleum, secondary recovery of petroleum from depleted pools occupied the attention of many competent technicians.

Among the trends in petroleum during the decade may be mentioned the tendency toward deeper drilling both in proved and in wildcat areas, greater emphasis on conservation, greater exploration in foreign countries, the search for stratigraphic traps and the exploration of the continental shelves.

Beginning with 1942, the Colorado School of Mines issued an annual Review of Petroleum Geology under the sponsorship of the research committee of the American Association of Petroleum Geologists, with F. M. Van Tuyl and W. S. Levings as editors.

Engineering Geology.—The marked success resulting from the application of geology to engineering problems in earlier years stimulated the applications to many outstanding construction projects during the decade. However, there was still a notable lack of the use of geology in highway construction work. The far-flung construction program of the United States reclamation bureau resulted in the building of a greatly enlarged geological organization in the bureau.

The leading publication in this field was Geology and Engineering, by R. F. Legget (1939). This emphasized the value of geology in large-scale construction work and in tunnelling and other ground operations.

Military Geology.—The axis nations greatly amplified the use of geology early in World War II. However, it was not until late in the war that the possibilities in this field were wholly appreciated by the military leaders of the Allied nations. By far the greater amount of geological advice to the armed services of the United States was rendered by the military geology unit of the U.S. geological survey. An informal statement dealing with the wartime contributions of this organization, prepared by the members of the staff of the unit, was issued by the Geological Society of America in 1945. The staff of the unit numbered 100, of whom 75 were geologists, soil scientists and other specialists. They received assignments from the intelligence division of the corps of engineers and compiled terrain intelligence folios on strategic areas.

Geology was widely used in the interpretation of aerial photographs. (See also Cartography; Geography; Marine Biology; Mineralogy; Palaeontology; Seismology.)

Geopolitics

The suicide of Karl Haushofer in March 1946 dramatically highlighted the collapse of the movement called "geopolitics" which he had founded, guided and personified. The ten preceding years had indeed been eventful. By 1935–36 the salient doctrines of geopolitics had been grafted into the burgeoning nazi state. After five years of fruiting on the sunny plateau of political favour, the taproot of Haushofer's "geopolicy" for Germany was cut by Adolf Hitler's attack upon the U.S.S.R., and with subsequent military reverses the blight spread swiftly.

That geopolitics should go into eclipse with the German military machine was inevitable because it was conceived and developed to make geography the servant of German militaristic statism. Karl Haushofer, an officer with a distinguished record as a member of the Bavarian general staff, resigned from the army two years before World War I in order to study geography. He had written two books on the territorial and military prospects of Japan when he was recalled to war service. He retired in 1919 (as a general) and became lecturer on geography at the University of Munich. There he devoted himself to the creation of a tool of policy which should help to lift defeated Germany once more to the pinnacle of military power.

To forge this tool he drew heavily upon political geography, while omitting awkward scientific facts and adopting only those concepts which promised to serve his political purpose. For this garbled political geography he borrowed the name "geopolitics" from the Swedish political scientist, Rudolf Kjellén. In the school of geopoliticians that he fostered was Rudolf Hess, through whose offices the doctrines of geopolitics were presented to Hitler and incorporated into that bible of naziism, Mein Kampf. After a few years, the sound geographers and political scientists who had been attracted by the new movement abandoned the field to a circle of uncritical devotees imbued with a mission to propagandize. The trend could be traced in the monthly periodical Zeitschrift für Geopolitik, which Haushofer founded in 1924 and edited continuously thereafter.

Once the nazi party was in power geopolitics came into official favour. Immediately, at the University of Munich, Haushofer was made professor of geopolitics, dean of the faculty of sciences and director of a newly

organized Institute of Geopolitics. The institute was an outgrowth of his university seminar, and was formed as a dragnet to gather information about the earth. It paralleled the service of "military intelligence" organized by the army general staff to collect facts for strategic purposes, but its scope was far wider, reaching out over the entire earth for geographic, demographic, economic and political information that might serve the German state in the "grand strategy" of total war. This material was classified by areas and was intended for twofold use—by government agencies and for propaganda and indoctrination.

An Arm of the Nazi State.—During the last ten years of its teaching, geopolitics permeated German life through several official organizations of the nazi state. They functioned either in research, education or planning, and often in more than one of these fields.

At the beginning of 1936 the National Bureau for Space Planning and Space Research (Reichstelle fur Raumordnung und Raumforschung) began operations under the control of the minister for public instruction. Its aim was the "purposeful reorganization of German Lebensraum," and it served as a means of injecting geopolitics into the public mind. It published a monthly magazine designed to popularize governmental plans for applying geopolitics to resettlement, relocation of factories and other matters affecting the use of space under nazi control; it took a hand in education by encouraging the study of geopolitics in the secondary schools, where courses in the subject were being introduced. After geopolitics was made a required subject in 1937, the bureau began to publish textbooks and pamphlets.

To prepare teachers for these courses and for cognate compulsory instruction in the lower schools and in the universities, study groups were set up within the National Socialist Teachers' association (National-sozialistischer Lehrer-Bund), an instrument of the ministry for public instruction. One of these groups studied the geopolitics of Germany (Heimatkunde), the aspect of the subject specified for the earlier years of schooling. The other group studied world geopolitics (Geopolitik), the subject for the later years. The teachers' association published a periodical embracing both subjects, significantly entitled Lebensraumkunde.

University instructors in geopolitics were formed into an Association of Workers in Geopolitics (Arbeitsgemeinschaft für Geopolitik), with headquarters at the University of Heidelberg. Other universities became seats of other agencies. At Berlin a school of political science (Hochschule für Politik), inaugurated in 1920 to engage in advanced study, had become a training school for foreign-service officers when the nazi authorities installed Karl Haushofer's son and student, Albrecht, as professor of geopolitics. At the beginning of 1941 this school was merged into the German Institute for the Study of Foreign Countries (Deutsches Auslandswissenschaftliches Institut) with a university faculty of its own.

The work of all research and educational institutions was integrated by the National Workers' Association for Space Planning (Reichsarbeitsgemeinschaft für Raumordnung). It reached out into the universities, penetrated the public school system of every administrative district, and distributed propaganda to the general public. The output of the several organizations engaged in research was brought to the government through the House of National Planning (Haus der Reichsplanung), set up at nazi headquarters in Berlin in 1935. Like several other

agencies, it published a periodical (Reichsplanung). A still more ambitious co-ordinating arm of government followed near the turn of the year 1936—the National Workers' Association for Space Research (Reichsarbeitsgemeinschaft für Raumforschung). Its function was to maintain contact between the governmental, research and instructional organs of geopolitics. A prominent means of making this contact was an annual conference attended by party and government men, scholars from universities and research institutions and teachers from both the middle and upper schools.

By 1937, human geography in Germany had become geopolitics. No practitioner of the craft was allowed to lecture or publish unless he conformed to the new dogma. At all levels of instruction, propaganda for German supremacy was given a geographic gloss, and the methods of geography were utilized to the full in making comprehensive studies of parts of the world where the nazi government hoped to carry German arms or German ideas. In both the collection of data and the spreading of propaganda, maps were used freely and with telling effect.

Geopolitics and War.—Between the accession of the nazi party in 1933 and the outbreak of World War II in 1939, geopoliticians were actively realizing the two functions set for it by Haushofer. One of these was the accumulation and preparation of facts about the earth for use by the German government; the other was indoctrination of the public with the viewpoint of geopolitics in order to get general support for radical practices of space-planning, such as large-scale resettlement. The numerous organizations sketched in the foregoing section constituted the machinery for achieving these ends.

Both of the immediate objectives had the ultimate goal of preparing Germany for war. More than a century earlier the Prussian, Karl von Clausewitz, in his treatise On War had promulgated the doctrine that peace and war are merely different facets of a single state policy. Haushofer subscribed to this view. His system of geopolitics grew out of political concepts about the earth that could lead only to war. To begin with, he assumed that the state is an organism, inexorably subject to laws of growth and decay. From this he deduced the right of the young German state to Lebensraum; i.e., to seize all territory required for its growing organism. The area to be taken had to include all the variety of natural resources needed for economic independence from the rest of the world because autarchy was a military asset and hence ranked among the objectives of geopolitics. Obviously, autarchy could be achieved only by creating political units far larger than Germany. Such aggregations Haushofer called pan-regions-a term suggested by the Pan-German movement of 1890-1915, a direct progenitor of geopolitics. A suitable pan-region could not be much less than continental in scope. In the struggle to integrate such vast areas the world might expect to find itself in the throes of a conflict between land power and sea power, because these two forms of force are based on the earth distinction most fundamental to politics-continental versus maritime location. The active front for every step in this policy of expansion was the frontier. This area was a zone in which a political boundary line was drawn, but such a line was considered merely as a temporary stopping place, to be overrun as soon as the state had prepared itself for the next aggression.

To the geopoliticians Germany seemed eminently and even uniquely fitted to become the ruler of an everenlarging area. It was surrounded by other and weaker states; hence it was in a position to apply the theory of the temporary boundary in successive seizures of adjacent territory. These aggressive acts could be justified by the need for Lebensraum by the growing German state, on its path toward autarchy. In time Germany might hope to become regnant in a pan-region including most of central and western Europe plus Africa. To overpass the Mediterranean would fan into flame the latent conflict between land power and sea power, because the crossing to Africa by Germany (a land power) would threaten the ocean routes and the sea power of Great Britain and its natural maritime allies. The geopoliticians further held that in its homeland Germany occupied a unique position, lying close by the heartland or core of Eurasia, the largest potential seat of land power, and at the same time in immediate touch by way of its Atlantic frontage with the sea power of Britain, and beyond with all the maritime states of the four continents that lay in a great crescent peripheral to Eurasia. From this argument it became a tenet of the geopoliticians' dogma that Germany should join forces with neighbouring Russia, the occupier of the Eurasian heartland, and then from the combined base move to conquer the scattered strongholds of sea power.

Pinnacle and Abyss.—The treaty of Aug. 1939 between the nazi and soviet states was for Haushofer the crown of his life's ambition. It set the official seal upon the teaching of geopolitics and paved the way for German domination of the world. The 22 months that followed saw geopolitics at its height. One by one its objectives were being achieved.

Germany's southeastern frontier had been moved outward with the march of German armies into Austria in 1938 and into Czechoslovakia in 1938 and 1939. The remainder of the eastern boundary gave way in the attack on Poland which initiated World War II. By the middle of 1940, the frontiers on the north and west were battered down. As a result, Germany's commodious Lebensraum included nearly all of continental and peninsular Europe north of the Alps and west of Russia. The economy of the conquered countries was promptly subordinated to and integrated with that of Germany proper, which thereby obtained a large measure of autarchy.

The southern German boundary was technically left intact, but in practice it was pushed far back. Once Switzerland was surrounded by nazi-dominated territory it was compelled to participate in the German autarchy in particulars useful to its big neighbour. Italy and the Mediterranean Italian colonies were drawn completely into the German orbit in the guise of allied lands. Besides functioning within the realm of German autarchy. Italy became the antechamber to a widening Lebensraum in Africa opened by victories of German armies there. This stride overseas looked to be only the first toward realizing a Eurafrican pan-region in which Germany would figure as the dominant, organizing element. Already the entire western bulge of the African continent was neutral, with more benevolence than international law required-the bulk of it being controlled by the Vichy French government and the remainder by a Spanish

In moving across the Mediterranean, the German armies precipitated the issue of land power versus sea power. They rendered the Mediterranean sea useless as a route of commerce or of supplying British theatres of war and reduced British holdings to three widely separated garrisons. The British Isles themselves, historic seat of sea

power, were beleaguered by submarine blockade and aerial bombing (both land-based on the newly-acquired Lebensraum) and threatened with invasion by troops ferried across the channel. The alignment of world land power against world sea power would be complete with overt support of Britain by the United States of America and of Germany by the soviet union. Thus by the spring of 1941 the whole grandiose plan that had been partially devised and was enthusiastically championed by the geopoliticians seemed about to take practical shape.

Instead, it was demolished by the German attack on the soviet union in late June 1941. After that date it was futile to cherish the geopoliticians' dream of uniting Russian vast space, huge manpower and unfathomed natural resources with German central location, industrious population and skilful utilization of natural resources. Fear of this formidable and reciprocal combination had been expressed by the British geographer, Sir Halford Mackinder, at the end of World War I, and means of achieving it had ever after been sought by Haushofer as the capstone in the edifice of geopolitics.

Haushofer accepted the downfall of his hopes with outward resignation but some months later he was placed under arrest by the nazi government. Although he was subsequently released, his son and disciple, Albrecht, was executed for complicity in the attempt on Hitler's life in 1944. Less than a year later, U.S. invading troops seized him as one of the organizers of the German attempt to dominate the world. Not being indicted, he was allowed to retire to his country estate near Munich. In March 1946, his body and that of his wife were found on the estate under circumstances that were pronounced suicide.

Revival?-With its promoter dead and its methods discredited, geopolitics might be classed as history. Presumably the movement was defunct and its name discredited. But it was unsafe to assume that its underlying concepts had disappeared. It had kept alive and promoted aggression during one period of peace. Evidence was accumulating that the interchangeability of peace and war, as stated by Karl von Clausewitz long ago, had never been rejected by Germany. In any case, the position of Germany in the earth's political pattern remained unaltered. It still stood between the potential land power of the Eurasian continent and the possible combination of sea power of the North Atlantic basin-each the maximum conceivable aggregation of its type. So located, Germany continued to partake of the life and interests of both worlds and could shift its weight readily from one side to the other. By renewed manipulation of the ideas embodied in geopolitics, under whatever name, Germany might again be able to plunge the world into war. (See NATIONAL SOCIAL-(D. WH.)

Weigert, Generals and Geographers (1942).

George II

King George of Greece (1890—), was born at Tatoi near Athens on July 20, 1890, the eldest son of King Constantine, and succeeded to the throne for the first time in 1922. Deposed March 25, 1924, after a series of uprisings, he spent the next 11 years in exile until his recall by the Greek assembly in 1935 upon the restoration of the monarchy.

When Italy began its invasion of Greece through Albania on Oct. 28, 1940, King George assumed command of the army, his popularity increasing with Greek victories in Albania. On April 23, 1941, when nazi troops approached Athens, he fled with his government to Crete after declaring that the fight would continue. He reached London on Sept. 22, 1941, and formed his government-inexile, pledging the restoration of democratic rule and the end of the dictatorship after the war. During the civil war following the liberation of Greece in 1944, the king continued in exile. In Nov. 1945 the republican and monarchist factions agreed that a plebiscite should be held in 1948 to determine whether George was to return, but the victory of the royalist party in the elections of March 31, 1946, advanced the date of the plebiscite to Sept. 1, 1946. Greece on that day voted overwhelmingly for the monarchy, and George II returned to Athens on Sept. 28, after five years of exile. He died April 1, 1947, and was succeeded by his brother, Paul I. (See Greece.)

George VI

George VI (1895—), king of Great Britain, Ireland and the British dominions beyond the seas, emperor of India, second son of the duke of York, afterward King George V, and Queen Mary, was born at York cottage, Sandringham, on Dec. 14, 1895.

His career and reign had close parallels with his father's. Each was educated without expectation of succeeding to the throne, and each entered the navy, so far as might be, "professionally." Again, each succeeded to the throne little known to the public men of his day and in times of abnormal difficulty. In each case, doubt was felt as to his ability to cope with the difficulties ahead, and each swiftly showed such doubts to be groundless. Each was soon leading the nation in a world war.

Prince Albert, as he was then known, enjoyed a happy childhood reasonably free from restrictions. He passed through the naval colleges of Osborne and Dartmouth at the usual ages and put in some terms at Trinity college, Cambridge university. He served three years as midshipman and seven as a lieutenant. He served in the grand fleet in World War I and was present at the battle of Jutland. In 1918 he was on the staff of the independent force, royal air force. In June 1920, he was created duke of York. On April 26, 1923, he married Lady Elizabeth Bowes-Lyon. Princess Elizabeth was born on April 21, 1926, and Princess Margaret on Aug. 21, 1930. The marriage proved an ideal one and was a turning point in his career. It gave him the partner with whom to share "the loneliest job in creation" and his tremendous responsibility.

In Dec. 1924 the duke and duchess paid an unofficial visit to East Africa, during which the duke gained knowledge of conditions in East Africa. Less widely travelled than were his father and elder brother, he had seen something of the empire during his naval service and with the duchess carried out an important visit to Australia to open parliament at Canberra in 1927. King George VI ascended the throne on Dec. 11, 1936, on the abdication of his elder brother, King Edward VIII. He was crowned in Westminster abbey on May 12, 1937.

The happiest selection guided the composition of the new court. Sympathy, simplicity, naturalness and gaiety were combined with the now traditional virtues of the monarchy—rigid sense of duty, irreproachable constitutional impartiality, good sense and good manners. The influence of the court began to permeate the wider circle of

King George VI (right) amused by comedians at a vaudeville show for the British home fleet in April 1943

society, which during the years between wars had gradually relaxed its standards of conduct.

The new king followed closely the pattern established by his father. In the weeks succeeding the coronation he was kept busy with the many ceremonial occasions attendant upon it, and there was an exceptional amount of reorganization connected with the abdication. The king and queen initiated as soon as possible a series of royal tours of industrial areas and entered on their ceremonial duties with dignity and confidence from the start.

In July 1938, in a universal atmosphere of tension, they paid a state visit to Paris while the king was still convalescent after illness, and they continued their tours of industrial centres. In the critical late summer of 1938 the king broke his Balmoral holiday, returning to London to receive Neville Chamberlain, then premier, and on Sept. 1 for the first time in history he paid a personal call at No. 10, Downing St., initiating a new precedent in the relations of sovereign and first minister, which became more common during Winston Churchill's war premiership. Preparations were now on foot, in view of the almost certainty of war, to repair the country's defenseless state and the king began to visit the training centres and secret headquarters of the fighting services all over Britain. The outbreak of World War II in Sept. 1939 found King George well informed in the preparations on foot in the services. In the course of that year the king and queen had paid a visit of first importance to the U.S. and Canada, making invaluable contacts. They cemented a warm friendship with Pres. Franklin D. Roosevelt and gave him and many leading Americans and Canadians a new view of the British monarchy and a fuller understanding of the character of the British people.

Throughout the years of World War II the king, like his father, lived much as did a commander in the field, carrying out the duties which fell to his lot. It was a younger court than that which set the pattern of endurance and courage, sacrifice and fellowship, in 1914–18. The same example and inspiration emanated from the throne; but to the older virtues of patience, duty, courage and faith there was added a cheerfulness.

Buckingham palace remained throughout World War II the king's headquarters. Often he dined with or visited Churchill in Downing St. When bombs fell on the city and the palace (within 50 yd. of where the king sat at his desk), the king and queen were among the first to walk amid the ruins, offering sympathy, counselling patience and encouraging endurance. No danger, no repugnance from horror, deterred them from the calm performance of their duty. They set the keynote of "London can take it." The royal family probably took more personal risks than had any British royal family since the Hanoverian line began.

World War II left King George VI at the apex of his powers and in the prime of manhood. The broadcasts of the king and queen were a signal example of close sympathy and understanding with their people. The king's radio talks gradually grew in strength and authority, and the queen from the first proved an excellent broadcaster. The regular Christmas broadcasts by the king followed the familiar, family-circle pattern at which his father excelled. The first included a happy quotation ("Put your hand in the Hand of God") which was much discussed. The broadcast of Christmas 1942 announced the worst danger passed. Of his special broadcasts, that of Sept. 9, 1939 ("Stand firm and calm") made a deep impression. His Empire day, 1940, talk confirmed his own confidence and his people's. Of the queen's broadcasts, those to the women of France and of the empire perhaps best revealed her deep sympathy and comprehension.

The king's visits to his land fronts were of necessity rather more curtailed than his father's; but his visits to the North African front in June 1943, and to Italy in July-August 1944 were certainly more important and onerous and entailed greater risks. His visits to theatres of operation included the following: home fleet (Oct. 5-8, 1939); France (Dec. 4-10, 1939); home fleet (Aug. 9-11, 1941); home fleet (June 6-8, 1942); home fleet (March 18-21, 1943); North Africa (June 12-24, 1943); home fleet (Aug. 13-15, 1943); home fleet (May 10-13, 1944); Italy (July 22-Aug. 3, 1944); home fleet (Sept. 28, 1945).

When World War II ended the king and queen and princesses received from the crowds the same heartfelt ovations which had been accorded to King George V and to Queen Mary.

The death on war service of the duke of Kent and the appointment of the duke of Gloucester to Australia had left the king very much alone to cope with the heavy strain of ceremonial. After World War II Princess Elizabeth began at once to take a full share in such duties as could fall on a princess. The royal family lived more and more in the public view, the head and inspiration of the nation's family life.

The king's routine of duties included his ceaseless preoccupation with state affairs, his consultations with his ministers, ambassadors, service chiefs, his contacts with foreign representatives, his daily handling of state business On Sept. 24, 1946, he travelled from Balmoral to open and to broadcast on the "Britain can make it" exhibition.

King George became soundly versed in affairs of state with a continuous experience exceeding that of his ministers. With his mother's natural quickness of mind, he became known for his ability to put his finger on the vital issue, and he took infinite pains to acquire a real comprehension of the more difficult points in social, economic and political questions. He had acquired all his father's straightness, sense of duty and loyalty to his personal staff, and the same complete impartiality in his dealings with his governments.

George, Harold H.

George (1892-1942), U.S. army air officer, was born Sept. 14, 1892, in New York city. A lieutenant in the air corps during World War I, he won the distinguished service cross for downing five German planes. He sailed for duty in the Pacific in April 1941. After Pearl Harbor, he was promoted to brigadier general and was assigned to Gen. MacArthur's forces in the Philippines, where he commanded the U.S. air force during the Japanese invasion. Gen. George was an outstanding figure in the Bataan battles. He started the "bamboo fleet," a squadron of four ancient commercial planes which flew desperatelyneeded food and medicine to Bataan from the southern islands. He was expert at concealing grounded planes, and none of his planes on Bataan were ever destroyed on the ground. Gen. George, whose death in a plane accident was reported on April 30, 1942, was posthumously awarded the distinguished service medal.

George, Harold Lee

), U.S. army officer, was born July George (1895-19, 1895, in Somerville, Mass. Educated at George Washington university and at the National university of Washington, he was appointed secretary to the U.S. comptroller of currency in 1917. He soon left this post to join the army and was commissioned a 2nd lieutenant in the air force the same year. Remaining in the army after the war, he was closely associated with Gen. "Billy" Mitchell, the prophet of air power. When Gen. Mitchell was given the opportunity to demonstrate the value of aerial bombardment in 1921, George participated in the experimental raid. He also served as a defense witness for Mitchell when the general was tried for insubordination. George engaged in experimental work in developing aerial armament and bombs at the Aberdeen proving grounds from 1921-25, and was head of the bombardment section in the office of the chief of the air corps during the following four years. In 1940 he became commanding officer of the 2nd bombardment squadron, the first organization to be equipped with four-engined Flying Fortresses. The following year, he was named assistant chief of air staff for war plans, and in March 1942 became the commanding general of the air ferrying command, later known as the Air Transport command. George was promoted to the rank of lieutenant general on April 12, 1945.

George, Walter Franklin

George (1878-), U.S. legislator, born Jan. 29, 1878, at Preston, Ga., began the practice of law in 1901 at Vienna, Ga., after graduating from Mercer university, Macon, Ga. In 1907 he became solicitor general for a

state judicial circuit and by 1917 had advanced to the bench of the supreme court of Georgia. He became U.S. senator in 1922 and was re-elected for six consecutive terms, withstanding Pres. Roosevelt's attempt to "purge" him in the senatorial election of 1938. George was a member of the conservative southern bloc, opposing antilynching, wage-hour, government spending and price control acts and, in Jan. 1946, leading the filibuster against the Fair Employment Practices act. He was chairman of the senate foreign relations committee from Nov. 1940 until Aug. 1941, when he became chairman of the senate finance committee.

Georgia

A southern state, one of the original states of the union, Georgia was fourth to ratify the constitution; popularly known as the "Empire State of the South." Area 58,876 sq.mi. (including 358 sq.mi. of inland water); pop. (1940) 3,123,723; urban 1,073,808 (34.4%): rural 2,049,915 (65.6%); native white 2,026,362; Negro 1,084,927; foreignborn white 11,916; other races 518. Capital, Atlanta (302,288); the next largest cities are Savannah (95,996); Augusta (65,919); Macon (57,865). The population of the state was est. at 3,223,727 on July 1, 1944.

In Nov. 1936 E. D. Rivers had been elected governor on a program of support for the New Deal. In June 1937, 26 amendments were adopted by a vote of the people, the most important concerning old-age pensions and the classification of property for tax purposes.

Rivers was renominated in the September primary of 1938. In his campaign he sought endorsement for what he had done during his two-year term and an opportunity to complete his program. Under the county unit system of voting, Rivers received 282 votes as against 128 votes for his two opponents. In the November elections of 1938 the Democratic ticket was unopposed and the following state officers were elected in addition to Rivers: John B. Wilson, secretary of state; M. J. Yeomans, attorney general; George B. Hamilton, treasurer; Zach Arnold, auditor; William B. Harrison, comptroller; M. D. Collins, superintendent of schools; and Columbus Roberts, commissioner of agriculture. Chief justice of the supreme court was Richard B. Russell, Sr. Senator Walter F. George won renomination with 246 unit votes, as against 148 for Eugene Talmadge and 16 for Lawrence Camp.

In the Nov. 1940 elections Eugene Talmadge was elected governor without opposition, having easily defeated his opponents for the Democratic nomination in the primary, which, in Georgia, is equivalent to election. He had served two terms as governor (1932–36), and after the constitutional interval of four years he became the second man in Georgia's history to hold that office a third term. Other successful candidates were: John B. Wilson, secretary of state; Ellis Arnall, attorney general; George B. Hamilton, treasurer; Homer C. Parker, comptroller general; M. D. Collins, superintendent of schools; Tom L. Linder, commissioner of agriculture. In the presidential election Roosevelt received 265,194 votes; Willkie 23,934; Babson (Prohibition) 983; and Thomas (Soc.) 1.

In 1941 a constitutional amendment was adopted extending the term of governor and state school superintendent from two to four years. The biennial session of the general assembly passed measures providing for reorganization of government departments; reduction in salaries of elected officials; more centralized control of state finances by the governor; and reduction in unemploy-

ment compensation tax on employers. In the gubernatorial primary of 1942, Ellis Arnall won the nomination by a popular vote of 174,198, against 127,488 for the encumbent Eugene Talmadge. Arnall's nomination was ratified in the November general election. The principal issue of the campaign was the loss of the accredited rating of Georgia's university system on the charge of political interference by Talmadge. Other state officers elected were: Homer C. Parker, comptroller general; T. Grady Head, attorney general; Richard B. Russell,

Ir., U.S. senator.

Important legislative reforms enacted by the 1943 session of the general assembly included: a reorganization of the board of regents of the university, providing for appointment of members by the governor subject to senate approval, to remove the governor from the board and to secure restoration of the university's accredited rating; the proposal as a constitutional amendment of a retirement plan for the state's 23,500 teachers; abolition of the governor's power to grant pardons and paroles and transfer of this power to a three-man commission; abolition of the system of allocating all incomes from certain taxes and fees to specific departments; requirement that expectant mothers be tested for venereal disease; provision for the election of the state auditor by the legislature.

In a special election in Aug. 1943 the following proposals by the assembly were ratified as constitutional amendments: reorganization of the board of regents; establishment of a pardon and parole board; teacher's retirement act; reduction of voting age from 21 to 18; authorization for the appointment of a commission to draft a new constitution; exemption of out-of-state subsidiaries of state corporations from ad valorem and intangible taxes; granting all war veterans uniform civil service preference. An extra session of the general assembly met Sept. 27 to Oct. 1 to enact prison reform measures. During 1944 Gov. Arnall and the state's attorney gen-

eral instituted a case against 20 railroads, charging them with freight rate discrimination against the state of Georgia. The governor also appointed a committee on constitutional changes to prepare a new state constitution which would be submitted to the legislature in 1945. In the November elections Roosevelt received 268,187 votes and Dewey received 56,506.

The principal achievement of the general assembly's 1945 session was the drafting of a new state constitution. Provisions of the new constitution, which was ratified by the people on Aug. 7, included repeal of the poll tax; establishment of the office of lieutenant governor; allocation of all state revenues to the general treasury from which expenditures would be made under budgetary control; establishment of constitutional status to the public service commission and the state board of correction; authorization for towns and cities to issue certificates of indebtedness to acquire power plants.

Candidates for governor in the Democratic primary on July 17, 1946, were Eugene Talmadge (governor, 1933-37; 1941-43), Eurith Dickinson Rivers (governor, 1937-41), James Vinson Carmichael and Hoke O'Kelley. Talmadge campaigned upon a platform of white supremacy. The vote, largest ever cast in Georgia, gave a county unit tally (decisive in Georgia) as follows: Talmadge 242; Carmichael 148; Rivers 20. The popular vote for Carmichael was 314,421, for Talmadge 305,777 and for Rivers 69,750.

Talmadge died on Dec. 21, 1946. The Georgia constitution was not clear on the question of succession in this case, so the year 1946 closed with the people uncertain whether the governor would be Melvin E. Thompson (lieutenant governor-elect), Herman Talmadge (son of Eugene, campaigning for election by the general assembly) or Arnall.

Georgia Warm Springs Foundation

The Georgia Warm Springs foundation, established in 1927 by Franklin D. Roosevelt, was transformed during the decade 1937–46 from a convalescent home for victims of infantile paralysis (q.v.), specializing in hydrotherapy, into a complete orthopedic hospital and an educational and research centre devoted to the after-effects of poliomyelitis.

It also became, after the death of its founder and the dedication of the "Little White House," a national shrine.

In 1937 the foundation received a large share of the funds raised in the United States each January through the celebration of the president's birthday. But in 1938 the National Foundation for Infantile Paralysis was formed, with local chapters in almost all counties of the country. After that time the Georgia institution's expansion was supported by grants totalling more than \$1,500,000 from the National foundation, and in addition, the cost of treatment of a large number of its patients was met by National foundation chapters.

Before 1939 the institution was known chiefly for its pool treatment. All surgery was performed in Atlanta hospitals. But with the opening of the new medical building and the development of other methods of treatment, its horizons broadened. The foundation became a centre for orthopedic reconstruction and began accepting patients for acute and early care. In 1941 a Post Graduate Physical Therapy school was established, and short courses for medical experts were given.

Hospital bed capacity, formerly 110, was almost doubled in 1946, when additional facilities provided 200 beds. From 1937 through 1946, 3,575 patients were treated; 656 professional men and women were given special training. In 1941 Pres. Roosevelt wrote:

In my opinion, it would be a mistake to think of the Foundation as just a hospital. It is all of that and more. . . . The Foundation has unquestionably done much good for individual cases, but it has been working to the end that it might also be able to discover something of value for those thousands of cases which, of course, it cannot care for. Its very existence . . . has aroused to an unbelievable extent . . . a public recognition of the havoc caused by this disease and the necessity for making every effort to bring it under control. (Georgia Warm Springs Foundation Report, 1941.)

(B. O'C.)

Gerbrandy, Pieter Sjoerds

), Netherlands jurist and states-Gerbrandy (1885man, was born April 13, 1885, in Goenga, Friesland. He was educated at the Amsterdam Free university and was admitted to the bar in 1911. A member of the Friesland provincial government from 1919 to 1930, he was professor of commercial law and international private law at the Amsterdam Free university from 1930 to 1939. In the latter year, he became justice minister; in 1940, following the German invasion, he fled with the royal family and the government staff to London, where he was prime minister of the Netherlands government-in-exile from 1940 to 1945. On Oct. 7, 1944, Prime Minister Gerbrandy described the German inundations of the Netherlands as a calamity that would result in starvation for many thousands of his countrymen. He visited the liberated portion of the Netherlands in Nov. 1944.

Gerbrandy and his government resigned May 16, 1945, in fulfilment of a pledge made earlier that the exiled regime would resign as soon as the liberation of the

Netherlands was completed.

Gerlier, Pierre

Cardinal Gerlier (1880—), archbishop of Lyon and primate of France, was born June 14, 1880, in Versailles. After studying law in Normandy and at Bordeaux and practising at the bar of Paris, he entered a Catholic seminary. His ecclesiastic studies interrupted by World War I, he spent most of the period of the war as a prisoner in Germany. Returning to Paris, he resumed his studies and was ordained a priest in 1921. He was appointed bishop of Tarbes and Lourdes in 1929. In Oct. 1937 Pope Pius XI elevated him to the archbishopric of Lyon, and proclaimed him a cardinal the following December.

After the defeat of France in 1940, Cardinal Gerlier predicted his nation's recovery and approved the reconstruction program of Pétain's Vichy government. But in Aug. 1942, with the announcement of the policy of discrimination against the Jews, the cardinal became openly hostile to the Vichy regime. He protested to Pétain against the persecutions, and instructed his priests to protect their neighbouring Jews when the police appeared. He also publicly opposed the practice of forced labour, and banned funeral rites for French legion members fighting with the Germans on the eastern front.

See NATIONAL SOCIALISM.

German Literature

The more victories Adolf Hitler won in World War II. and the more firmly he closed his borders, the harder became the task of German authors inside as well as outside the country to warn the German people of naziism. Those who left the country had freedom but little influence; those who stayed had enormous influence, but almost all of them succumbed either to propaganda or to fear.

German literature during the decade 1937-46 can, therefore, be divided into nazi and non-nazi literature, but this division is not a very rigid one, as there were many authors who vacillated more or less between the two camps. In this article, therefore, German authors are classified according to whether or not they lived and wrote in Germany.

Inside Germany.—Most of the books published in Germany during the decade, 1937-46, scarcely deserved mention, and many of them had disappeared altogether by the end of 1946. Hans Heinz Ewers was perhaps the best known of the purely nazi writers; as early as 1932 he had written a book glorifying Horst Wessel. Dietrich Eckart, Hans Johst (the latter president of the Association of German Writers) and Richard Euringer were also prominent. The writings of Hans Friedrich Blunck were published widely; they included Die Nordische Welt-Geschichte, Wesen und Bedeutung der Nordischen Völker (1937) and Frauen im Garten (1939). The giant printings of these works pointed not only to support of the nazi party but to the mental attitude of the readers.

Much more dangerous were the two Juengers, brothers or cousins; they were able to disguise their naziism in expressions of mysticism, which increased the enthusiasm of the German public for their works. The younger, Friedrich Georg Juenger, seems to have tried to shed the nazi influence in *Der Krieg* (1936), *Griechische Götter* (1943) and *Die Titanen* (1944). But Ernst Juenger was much

better known and more influential; he early learned how to veil his definite nazi convictions in double meanings and obscure comparisons. Thus the governing nazis did not interfere with his work, and non-nazi readers in their turn found it acceptable. Among his works were Afrikanische Spiele (1936) and Auf den Marmor-Klippen (1939-40); in the latter, he celebrated in the symbolic figure of the protagonist, a forester, all that went on in Germany at the time; when asked to explain the symbolism of the book, he gave dubious answers. He used similar techniques in Blätter und Steine (1942) and Gärten und Strassen (1942). Immediately after the defeat of Germany, in an illegally-circulated pamphlet called Der Friede, he haughtily protested his innocence and accused the English and French of equal complicity with the Germans in the crimes of war.

In Germany, Catholics were generally more prominent opponents to the nazi regime than were Protestants. Reinhold Schneider took refuge in historical comparisons, especially in his Las Casas vor Carl V (1938) wherein he confronted the famous friend of the Indians and opponent of slavery with another Dominican friar, "who apparently esteemed the State more highly than he did eternal justice," a phrase which could not fail to be understood by many of his readers. His poems circulated in the form of handbills in 1943 and were published in Switzerland in 1945 under the title of Die Letzten Tage at a time when Schneider was ill in a hospital. His death was reported later.

Among "converted" authors, Werner Bergengruen was noteworthy. His novel, Am Himmel und auf Erden, an enormous success in 1940, described an elector of Brandenburg whose astrological calculations led him to expect the end of the world; German readers applied this prophecy to their own age. In Der Tod von Reval (1939) and Der Spanische Rosenstock (1941), he still seemed something of a nazi. Later developments apparently influenced him deeply; in 1945 he published a volume of poems, Dies Irae, in which he vividly expressed the German feeling of remorse.

Ricarda Huch, superior in genius to all Germanresident authors mentioned here, was definitely never a nazi, but she glorified Germany's national interests at all times and did not oppose naziism in her books, Das Zeitalter der Glaubens-Spaltung (1937) and Weisse Nächte (1943). A year after the German defeat she spoke in favour of humanistic ideals in her work, Urphänomene.

Ernst Wiechert was no doubt the most courageous writer, though his talents were inferior to those of Ricarda Huch. In 1935 he delivered a speech at the University of Munich which brought him into disrepute with the rulers of Germany, but he wrote so cautiously that his novels, Atli, Tobias (1938) and Das Einfache Leben (1939), were not banned by the nazis. After Germany's defeat he fully identified himself with the guilt of the German people in his Rede an die Deutsche Jugend (1945). In 1946 he published Märchen and Der Totenwald, the latter a report of his stay in Buchenwald, where he was imprisoned for a short time in 1937 under much better conditions than those suffered by later prisoners.

Gerhart Hauptmann, one of the great German authors of the 20th century, evidenced a serious break with those convictions according to which, as an opponent of the kaiser, he had reigned as poet of the republic for more than a decade. Yet he crossed over into the camp of the nazis immediately after Hitler's entry into power. Pri-

vately, he attributed this change to concern for the fate of his son; nevertheless, he regretted the step. He soon withdrew, and by 1946, at nearly 80 years of age, returned to his earlier forms with two dramas of the classic cycle, Iphigenia in Aulis and Agamemnon's Death.

Emigrés.—Among those who left Germany, the writers who had been known to the world long before Hitler took their stand as anti-nazis or at least did not support naziism. Dozens of them, Jews as well as Christians, remained militant journalists and thus did not necessarily enrich German literature. Some new names arose in serious literature during the period of emigration, among them Anna Seghers, who wrote in Paris and depicted a strike of mineworkers in her novel Die Rettung. Others included Juan Gebser, half Austrian, living first in Spain and later in Switzerland, who wrote volumes of poetry, Winter-Gedicht and Ariadne-Gedicht (1945), and Max Herrmann-Neisse, with two volumes of poetry, Um uns die Fremde (1936) and Erinnerung und Exil (1946).

Most talented of the new group was Arthur Koestler, Hungarian-born German, a former journalist who not only followed a strict anti-nazi but also an anti-communist line. His Spanish Testament, written in prison in 1937, enjoyed wide popularity; it was followed by The Gladiators (1940), Darkness at Noon (1941), Arrival and Departure (1943) and Thieves in the Night (1946).

Most of the writers well known in Germany before World War II continued to work without concerning themselves too greatly with the problems of the time.

Erich Maria Remarque had been maligned in Germany even before Hitler, as he had been an antimilitarist all his life. In two brilliant books, Three Comrades (1937) and Love Thy Neighbor (1941), he continued to write along these lines and appeared as a fighter for freedom in Arch of Triumph (1946). Else Lasker-Schueler (1876–1944) also carried on her earlier themes, mostly in Palestine itself, in her Das Hebräer-Land (1937) and Neue Gedichte (1943).

Thomas Mann added two more volumes to his Joseph cycle, Joseph in Egypt (1938) and Joseph the Provider (1944). In addition he wrote The Transposed Heads (1941) and The Law (1944); in 1940 he published a parody of Goethe in his old age, Lotte in Weimar.

Stefan Zweig, a Jew, always opposed to militarism and every use of force, was obliged to emigrate very early. His suicide in 1942 was only indirectly connected with the nazis. Having considered himself a European all his life, he stated in his testament that he died because he had no home. German literature lost one of its great men with his death. He wrote Begegnungen mit Menschen, Büchern, Städten (1937); Conqueror of the Seas (1938); Beware of Pity (1939); Brazil, Land of the Future (1941); Royal Game (1944); and an unfinished work on Balzac (1946).

Lion Feuchtwanger, who fought the nazis from the stage for the first few years, later occupied himself with the communist and Jewish problems of his earlier novels and left the German question in the background. He wrote Moscow, 1937 (1937), False Nero (1937), Paris Gazette (1940). The Devil in France (1941), Double, Double, Toil and Trouble (1943) and Simone (1944).

Franz Werfel (1890–1945), one of the greatest geniuses among German authors of the 20th century, likewise was fully opposed to force and the nazis. A Jew, he lived as a believing Catholic and did not enter the struggle directly. He wrote In einer Nacht, a play (1937); Harken Unto the Voice, a novel (1937); Embezzled Heaven (1940) and The Song of Bernadette (1942). He defended per-

secuted Jews without reserve in his comedy, *Jacobowsky* and the Colonel, written in collaboration with S. N. Behrman (1944).

Bruno Frank (1887–1945), though he described the life of an emigrant in Closed Frontiers (1937), did not concern himself with the struggle directly. The novels of Carl Zukmayer, The Moon in the South (1937), A Summer in Austria (1937), Herr über Leben und Tod (1938), Second Wind (1940) and The Last Drop (1941) were also devoted to more timeless problems. Alfred Doeblin published Men Without Mercy (1937) and Das Land ohne Tod (two volumes, 1937–38) and Bürger und Soldaten (1939). Alfred Neumann wrote Man of December (1937), Die Goldquelle (1938), The Friends of the People (1941), The Fates (1944), as well as Six of Them (1945), in which he described the student demonstrations at Munich in 1943, using fictitious characters as the conspirators.

Heinrich Mann, whose magnificent book about the Germans, Der Untertan, was written in 1914 but not published in English until 1943, edited the classic collection Der Hass, in which he allowed the greatest German and foreign authors to speak critically about Germany, and at that, in Switzerland where such things were frowned upon at the time; he evidenced similar sentiments in Lidice.

Arnold Zweig wrote in like vein in Palestine: Insulted and Exiled (1937), The Crowning of a King (1938), Caliban, and Spielzeug der Zeit. Emil Ludwig, in his The Germans (1941), traced the martial spirit of the German people and their traditional nazi-type ideologies through 500 years. He also wrote Stalin (1942), Beethoven, Life of a Conqueror (1943), The Mediterranean, a sort of history of Europe up through the age of Columbus (1942) and Der Entzauberte Freud (1945).

Berthold Brecht published plays, Der gute Mensch von Sezuan (1942), Galilei (1942) and the books Furcht und Elend des Dritten Reiches and Die Mutter, Geschichten aus der Revolution. Friedrich Wilhelm Foerster continued to hold a unique position as essayist and educator.

Germany

A country under Allied military government after World War II, Germany extends from the Alps to the North and Baltic seas, and lies mainly between the Rhine and Oder rivers. Capital, Berlin (q.v.). Chief cities (1939 census): Berlin (4,332,242); Hamburg (1,692,695); Munich (828,355); Cologne (768,426); Leipzig (701,606); Essen (659,871); Dresden (625,174); Frankfurt-on-Main (546,649); Duesseldorf (539,905). There were 111 cities with a population of more than 50,000 each. The population of all these cities was somewhat reduced from the 1939 figure as a result of World War II. Religion (1933): Protestants 62.7%; Roman Catholics 32.5%; Jews 0.7%; others 4.1%.

The area of Germany at the end of 1946 was provisionally 143,243 sq.mi., with an approximate population, according to the preliminary figures of the Allied census of Oct. 29, 1946, of 66,000,000, distributed in the Allied military zones as follows: U.S. 16,600,000 (not including the Bremen enclave); British 22,600,000; Russian, 17,800,000; French 5,900,000; Berlin joint-control area 3,100,000. These figures did not include the 1,425,000 military and civilian forces of the Allied occupying governments (U.S. 290,000; British 350,000; Russian 725,000; French 60,000). According to the census of May 17, 1939, the area of the old German reich, not including Hitler's annexations of 1938 and the following years, was 182,471 sq.mi., with a population of 69,622,483.

Foreign Minister Joachim von Ribbentrop informing foreign correspondents in Berlin on April 9, 1940, that the invasion of Norway on that day was a means of protecting that country from occupation by Great Britain and France

General Scope of Hitler's Conquests.—As a result of Hitler's annexations of territory in 1938 and 1939, the population of the "greater reich," according to the census of May 17, 1939, was approximately 86,170,000 if the "protectorate" of Bohemia-Moravia was included. This greater reich was created by Hitler's annexation of the following territories: Jan. 13, 1935, Saarland, 864,000; March 13, 1938, Austria, 7,008,000; Oct. 1, 1938, Sudetenland, 2,945,000; March 15, 1939, Bohemia-Moravia, 6,805,000; March 22, 1939, Memel territory, 153,000.

After the campaign against Poland in Sept. 1939, Hitler added to the "greater reich" the populations of Danzig, the Polish Corridor, Posen and a strip of territory east of Silesia, regions which aggregated 36,242 sq.mi., with a population of 10,000,000. The Poles, as far as possible, were exterminated or removed from these conquered districts, and their places were taken by Germans from the reich or by tens of thousands of Germans "repatriated" from their old homes in Estonia, Latvia and Lithuania. Hitler also conquered more than half of the rest of Poland; its population of about 15,000,000 was organized under a national socialist administrator, Dr. Hans Frank, as the "general government" of Poland. Poles, if loyal to their conquerors, were allowed to hold subordinate official positions. Half a million Jews were herded into a walled ghetto in Warsaw. During the war, nearly 5,000,000 Jews were exterminated by cold and by starvation and in inhuman "death factories."

The reich also controlled more or less completely the governments of the populations conquered in the spring and summer of 1940: Denmark (3,777,000), Norway (2,900,000), Netherlands (8,640,000), Belgium (8,386,000), Luxem-

bourg (300,000), and the northern three-fifths of France known as "occupied France" (117,000 sq.mi. with an estimated population of 27,800,000). The remaining two-fifths of France, known as "unoccupied France," and the French colonial empire were left under the Vichy government of Marshal Pétain. Some 70,000 French families were suddenly expelled from Lorraine to unoccupied France, and Lorraine ceased to exist. On Nov. 30, 1940, it was incorporated directly into the "third reich" and combined with the Saar territory under Gauleiter (District Leader) Joseph Buerckel as the "Westmark." Alsace, from which French familiës were also expelled in large numbers, was placed under the administration of Robert Wagner, Gauleiter of Baden.

In addition, by the infiltration of German troops and secret agents, Germany gradually acquired domination over Hungary, Rumania and Bulgaria in the winter of 1940–41. In April, 1941, a blitzkneg against Yugoslavia (15,000,000) and Greece (7,000,000) destroyed the independence of these countries and brought their territories directly or indirectly under German control. Finally, attacking the U.S.S.R. June 22, 1941, Hitler's armies advanced within five months almost to Moscow and reached a line running from Leningrad in the north to the eastern part of the Sea of Azov in the south. But in late November and December of 1941 a strong Russian counteroffensive began to push the German armies back on the Moscow front.

Postwar Territory and Population.-After Germany's unconditional surrender, in accordance with the Yalta agreements of Feb. 1945 and the Allied Potsdam declaration of Aug. 2, 1945, Germany was deprived not only of all Hitler's annexations and conquests, but also provisionally of all former German reich territory east of the Oder and western Neisse rivers. Of this territory east of the Oder, the northern half of East Prussia, including Koenigsberg, was transferred to the soviet union; the rest of East Prussia, together with most of Silesia and Pomerania, a part of Brandenburg and Stettin were placed under Polish administration. Theoretically this disposal of German territories east of the Oder was only provisional; the final settlement of them was to be decided when the Allies made peace with Germany. But in the meantime Russia and Poland treated the territories as if they were definitely to belong to themselves. Germans were expelled and their lands and property handed over to Russians and Poles, thus tending to present the ultimate peace conference with a fait accompli. However, the U.S. secnetary of state, James F. Byrnes, in his speech at Stuttgart on Sept. 6, 1946, energetically reminded the Allies that the German territories were placed under Polish administration only provisionally and that "the extent of the area to be ceded to Poland must be determined when the final [peace] settlement is agreed upon." The German territory east of the Oder transferred to Russia and provisionally to Poland contained about 40,000 sq.mi. and had a population in 1939 of 9,300,000, i.e., nearly a quarter of the area and about one-seventh of the population of the old reich. A large part of the men of working age in this area were taken by the Russian armies to perform labour services in the soviet union. During 1945-46 what was left of this German east-of-the-Oder population-mainly women, old men and children-was uprooted and deported in large numbers to the truncated reich west of the Oder. Secretary Byrnes in his Stuttgart speech stated that he was willing that the Saar territory (738 sq.mi., pop.

770,000, almost wholly German) should be integrated with

In 1945-46 there were deported into Germany west of the Oder more than 3,000,000 German-speaking persons who had lived for generations in Danzig, the Polish Corridor, Czechoslovakia and Hungary, or who had been transplanted by Hitler during the war from the Baltic provinces or the Austrian Tyrol and given new homes in the nazi-conquered lands. These homeless, hungry, destitute deportees thrust into Germany greatly increased the difficulties of the armies of occupation, aggravated the unemployment problem, and were a heavy burden on the German people who were made responsible for their support.

At the time of Germany's defeat, in May 1945, there were also 8,600,000 foreign "slave labourers" in Germany -6,400,000 civilian workers and 2,200,000 working prisoners of war. They had been imported into Germany by Hitler from nazi-conquered lands to labour in the fields and factories in the place of Germans who were conscripted into the nazi fighting forces. These "displaced persons" were at once liberated by the Allies and repatriated as fast as inadequate transportation and other difficulties allowed. By the autumn of 1946 there were only about 700,000 remaining to be repatriated; these consisted mainly of Poles, Baltic Germans and some Russians, who hated the bolshevists and violently resisted repatriation which would again have subjected them to soviet domination. (See also DISPLACED PERSONS.)

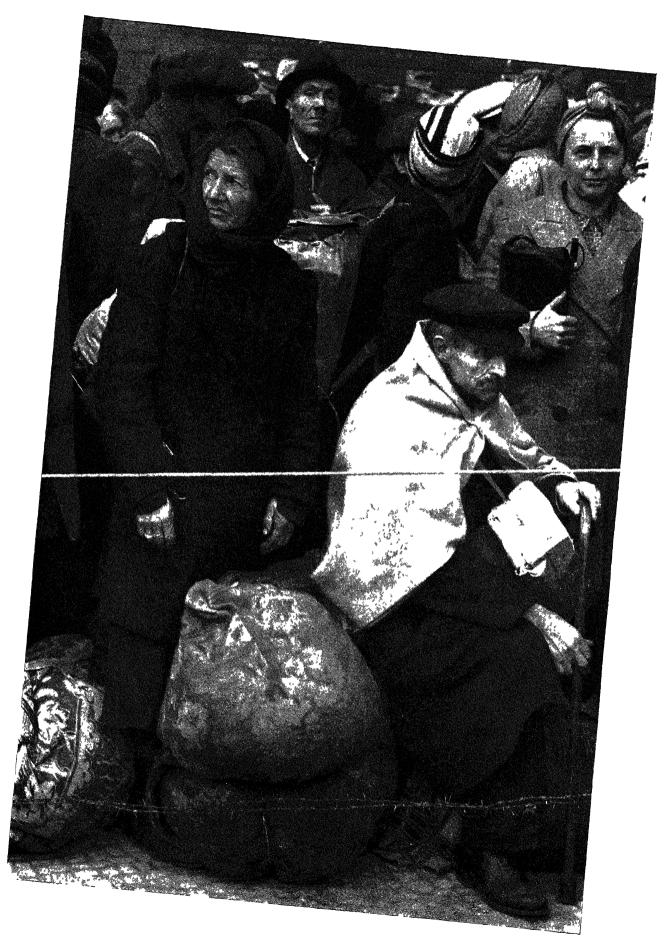

The number of Germans in the armed forces who were killed or permanently disappeared and lost during the war may be conservatively estimated at 4,000,000. In addition, more than 300,000 civilians were killed in air raids. More than 2,000,000 German prisoners of war were detained on transferred abroad to perform labour services in France, Russia and elsewhere. All German war prisoners in the United States were returned to Germany by the autumn of 1946.

The increased civilian death rate during the war years, because of war privations, disease, suicide, death in concentration camps and purges by the nazi police was in part offset by the nazi efforts to stimulate the birth rate.

Reich chancellor and fuehrer of Germany was Adolf Hitler from Jan. 30, 1933, to April 30, 1945; chancellor from April 30 to May 23, 1945, was Admiral Karl Doenitz; thereafter Germany was administered by the four principal Allies.

The Prelude to War.—The most important development in Germany during 1937–39 was the very rapid increase in the country's armed forces. The military limitations imposed on Germany by the Versailles Treaty were openly swept away by Hitler on March 15, 1935, when he decreed that the German army henceforth was to be based on the principle of universal short-term military service instead of being, as fixed by the treaty, a small, professional, long-time service army of 100,000. This decree at once raised the army to 500,000 and to more than twice that number, not including trained reserves and semi-military formations, by 1939.

The Versailles clauses limiting the German navy to six 10,000-ton battleships and forbidding all submarines was scrapped by the Anglo-German agreement of June 18, 1935, by which Hitler was allowed to have a total naval tonnage, including submarines, up to 35% of the royal navy. This meant that Germany might have naval vessels totalling 420,000 tons. In the autumn of 1936 she launched the "Scharnhorst" and the "Gneisenau," 26,000-ton bat-

tleships named after the two men who had helped build up the military forces by which Germany had liberated itself from Napoleon's domination. It was also building two mighty battleships of 35,000 tons or more which were later to achieve fame in World War II as the "Bismarck" and the "Tirpitz." In addition, many other types of vessels and a large fleet of submarines were rapidly constructed.

Army aircraft, absolutely forbidden by the Versailles treaty, were being secretly built by Hermann Goering soon after 1933 and numbered several thousand planes by 1939. Much of this new military and air equipment was tested out in Spain in the civil war which began there in 1936. In Sept. 1939, Hitler stated that he had spent 90,000,000,000 marks (about \$36,000,000,000) on German rearmament.

Besides these regular armed forces there were three semimilitary police formations which were reorganized early in 1937. A more complete separation was made between the "SA" (Sturmabteilungen) or Brown Shirts and the "SS" (Schutzstaffel) or Black Shirts. Both were agencies of the nazi party rather than of the German state. The Brown Shirts, formed first, were the famous ruffians who organized street fights with the Communists, guarded Hitler's early political meetings and aided him in building up the nazi party and in seizing power in 1933. They were weakened after the blood purge of June 30, 1934, when their leader Ernst Roehm and many of his associates were shot at Hitler's orders.

The Black Shirts or Elite Guard, formed later, were at first a special bodyguard for Hitler but rapidly grew in numbers until they eventually counted nearly 500,000 members. They were the most carefully selected and the most rigidly trained of all the police formations, and in 1937 were placed under the control of Heinrich Himmler as commander of the German police. They prided themselves on being the advance guard of national socialist philosophy in its most radical and uncompromising form. They were often at odds with the regular army (Wehrmacht) under the command of old Prussian generals, many of whom had a great dislike of and contempt for Hitler and Himmler.

Finally, there was the Secret Political Police or Gestapo (Geheime Staatspolizei). Its task was to ferret out and ruthlessly crush all tendencies endangering the safety of the nazi regime. Measures taken by the police were subject only to its own control and judgment, and were not subject to the jurisdiction of the administrative courts. As head of these police formations Himmler became, next to Hitler himself, the most powerful and the most feared man in the reich.

Four-Year Plan.—One of the most important agencies for increasing armaments between 1937 and 1942 was the Four-Year plan announced by Hitler at the Nuernberg party rally in Sept. 1936. It aimed to realize the slogan "guns instead of butter." Its execution was entrusted to Hermann Goering as economic dictator. He thereby was raised above Hjalmar Schacht, who had hitherto directed German economic policy. Schacht was cautious and conservative and not a member of the nazi party until Hitler conferred membership on him in 1937. Goering, on the other hand, was known as a man of great driving power and ruthless energy, devoted to building up Germany's military and economic strength, and was second only to Hitler in the party hierarchy.

The essence of the Four-Year plan was to make Ger-

many self-sufficient in view of the possibility of war and of the more or less economic isolation in which it found itself. Imports were even more rigidly restricted to those things which were absolutely necessary, or which could not possibly be produced in Germany, or for which substitutes could not be found. Such raw materials as were imported were very carefully allotted to industries in accordance with a "scale of urgency." This urgency was determined by the needs of the army, navy and air forces; by the necessities of house-building for the masses and the final ending of unemployment; and by the preferential treatment of those industries which were able to manufacture successfully for the foreign export trade. By propaganda and compulsion German consumption was turned from products which required importation from abroad to those which Germany could produce at home-from beef, lamb, butter and imported fruits and vegetables to pork, poultry, fish, cabbage, turnips and carrots. In industry, manufacturers were told to use less copper and chromium, and instead, if necessary, more aluminum. Agricultural production was intensified in order to make the counetry produce virtually all the food it needed. Tracts of moorland were reclaimed by the labour service army. Meadow land was turned over to raising wheat and rye. More silos were built for providing fodder for cattle which would eat and chew their cud day and night throughout the year in barns instead of grazing in the fields. German chemists devised substitutes for raw materials formerly imported. Gasoline production from coal was stepped up, and artificial rubber took the place of the imported natural product. As a result of these measures Germany improved its position for waging war, but the German consumer had to pay higher prices for goods of inferior quality or even go without them altogether.

This prewar preparation suffered, however, from excessive bureaucratic control, party interference and favouritism, red-tape, and the selfish aims of big business. By 1942 it was clear that these methods were not producing armaments in Germany as efficiently as they were being produced in the United States and in Russia by the quick improvisations of trained experts. Therefore, economic control was taken away from Goering, who had slumped in efficiency and lost favour with Hitler. A new economic system, "autonomy of industry," was instituted by Hitler's favourite architect, Dr. Albert Speer. He swept away the

"Inferior Decoration." An English cartoonist's concept in the Daily Dispatch (Manchester), of paperhanger Hitler's "new order" for Europe in 1941

bureaucratic and party red-tape and placed power and responsibility in the hands of carefully selected engineering or business experts inspired by his own practical efficiency and energy. As a result, Germany's armaments and even consumer goods again increased until they were very seriously cut down by the growing intensity of Allied bombing in 1943–45.

Anschluss.—For nearly nine centuries Germany and Austria had been united, first in the Holy Roman empire, and then in the German confederation from 1815 to 1866. Bismarck expelled Austria from the confederation in order to make a more closely united reich under Prussian leadership. The Versailles treaty forbade any reunion of Germany and Austria, but after 1933 Hitler schemed to bring it about. His policy was to alternate "friendly understanding" with threats of force and intrigues within Austria against the existing Austrian Republic.

On July 25, 1934, his nazis tried to seize power and assassinated the Austrian chancellor, Dr. Engelbert Dollfuss. But the nazis failed in their "putsch," partly because Mussolini rushed troops to the Brenner pass to protect Austria. Mussolini did not want Hitler for a neighbour, for fear he would try to annex the Tyrolese Germans who had been given to Italy in 1919. Two years later Hitler cajoled Dr. Kurt von Schuschnigg, who had succeeded Dollfuss as Austrian chancellor, into the friendly agreement of July 11, 1936. In this agreement Hitler "recognized the full sovereignty of Austria, including the question of National Socialism in Austria, which is to be regarded as exclusively an Austrian question, in which the German Government promises to exert no interference either directly or indirectly."

In spite of this agreement, Hitler again began to plot to seize Austria by intrigues or threats of force. He established a close friendship with Mussolini in 1937 which was emphasized by the Duce's spectacular visit to German army manoeuvres and to the Krupp munitions works in September of that year. This visit was supposed to strengthen the so-called "Rome-Berlin Axis." Japan was brought into closer relations with the two European dictators through Italy's adhesion to the German-Japanese anti-Bolshevist treaty of 1936. Early in 1938 a shake-up took place in the German army which resulted in the resignation of General Werner von Blomberg and 14 other high officers. Hitler then made General Wilhelm Keitel commander of all the armed forces. As Keitel stood directly under Hitler, this gave the fuehrer more direct contact with and control over the army.

Meanwhile in Jan. 1938, Austrian nazis under the leadership of Dr. Josef Tavs, with money from Germany, prepared a conspiracy to overthrow Schuschnigg. Austrian police, however, raided the nazi headquarters in Vienna, nipped the conspiracy in the bud, and seized incriminating documents. To prevent the disclosure of the Tavs conspiracy, Hitler put pressure on Schuschnigg to come to a "friendly understanding." The Austrian chancellor was persuaded to visit Hitler at the latter's mountain villa at Berchtesgaden on Feb. 12, 1938. He was browbeaten with threats of force until he consented, in order to prevent greater dangers to Austrian independence, to promise an amnesty to Tavs and the other conspirators. He also agreed to take some nazis into his cabinet, among them Arthur Seyss-Inquart, who became minister of the interior and thus could assume control of the Austrian police. Immediately upon his appointment he hurried to Berlin to make plans with Hitler and Himmler for the seizure of Austria. In Austria the nazi demonstrations and acts of violence became more numerous and menacing.

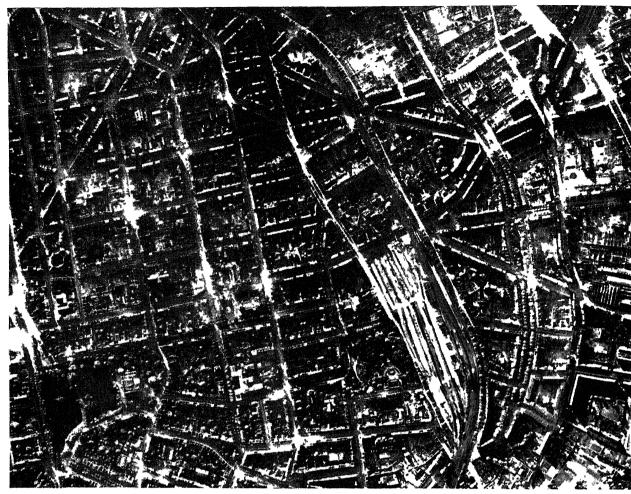

In an effort to thwart the nazi threat, Schuschnigg suddenly announced by radio that on the following Sunday, March 13, there would be a plebiscite to endorse his policy of independence for Austria. He hoped by this sudden move to prove to the world that the majority of the Austrians stood behind him, as they undoubtedly did. To prevent the plebiscite Hitler on March 11 sent an ultimatum demanding that it be postponed. The demand was emphasized by the massing of German troops and Black Shirt formations along the Austrian frontier. Armed resistance by Austria would have been hopeless. To avert bloodshed Schuschnigg finally stepped to the microphone in Vienna, and, in the middle of a concert program, declared that he had been forced to yield, adding, "God protect Austria."

Before dawn next morning German troops and police poured over the frontier at many points and aeroplanes swarmed over Vienna. On March 14 Hitler made his triumphal entry into the Austrian capital and made a speech from a balcony expressing his emotion that fate had at last enabled him to fulfill his divine mission of uniting his beloved Fatherland with the German reich.

Sudetenland and Munich.-This faithless annihilation of Austrian independence should have been a warning to the world of Hitler's duplicity and aggressive ambitions and should have led to measures to check him, but instead it led to a fatal policy of appeasement. By acquiring Austria, Hitler became master of territories on three sides of Czechoslovakia, which became the object of his next aggression. Within Czechoslovakia near the German frontiers lived some 3,500,000 Sudeten Germans. They complained that they were not given fair treatment by the Czech majority and they had undoubtedly suffered much from the general economic depression which began throughout the world in 1929. Led by a "little Hitler" named Konrad Henlein, they began to demand from the Czech government more political rights and greater economic advantages, and received secret encouragement from Hitler.

When local municipal elections took place in the Sudeten areas on May 21, 1938, there were rumours that the German army might intervene. The Czechs therefore mobilized part of their army and prepared to resist, in order not to suffer the same fate as Austria. Hitler did not move, and probably had not intended to do so at this moment. But he was very angry when the Czechs and the world gloated over the incident as a diplomatic triumph of the little democracy over the great totalitarian state. He immediately took a step which should have served as another warning of his future aggressive intentions. He ordered Dr. Fritz Todt, the able engineer who had been constructing Germany's fine new auto highways, to build on the western frontier against France a great line of fortifications which would prevent France from sending forces to protect Czechoslovakia. These fortifications, known as the "West Wall" or "Siegfried line," faced the French Maginot line, and were to give Germany protection in case Hitler became involved in war on his eastern frontiers. The fortifications were pushed forward with feverish haste. Every day 8,000 freight cars brought gigantic amounts of gravel, cement and steel for the 17,000 forts of the defense line. Nearly 500,000 men-Austrians, Germans, labour service battalions, and others—were employed. so that the West Wall was virtually completed at the time of the Munich crisis and probably contributed to the appeasement arrangements agreed to there.

During the summer Henlein and the Sudeten Germans

Skeletal ruins of Duesseldorf, photographed after the 56th R.A.F. bombing of the German industrial centre on the night of June 11, 1943

increased their demands. The British government sent a mission under Lord Runciman to try to effect some peaceful settlement. The Czechs were ready to make some concessions but these were rejected by Henlein upon Hitler's advice. The international tension rapidly mounted as Hitler prepared to address his followers at the annual party rally in Nuernberg. On Sept. 12, in an impassioned speech, he demanded the "right of self-determination" for the Sudeten Germans of Czechoslovakia, and announced that, if the latter could not defend themselves, "they would receive help" from him. This started demonstrations and riots between the Sudeten Germans and the Czechs. It seemed to indicate that a situation was being created to provide a pretext for the German army to invade Czechoslovakia to protect the "tortured and oppressed" Sudetens. As such an invasion would probably precipitate a general European war, the British prime minister, Sir Neville Chamberlain, made three flights to Germany for personal interviews with Hitler.

Convinced by Hitler's fiery language that Hitler would use force unless the Sudetens were allowed to join the reich, Chamberlain agreed in principle and accepted the proposal that the details should be worked out in a conference at Munich between Hitler, Mussolini, Edouard Daladier of France and himself. As a result of this appeasement policy, the Munich accord provided that the Czechs were to begin evacuating the Sudeten areas on Oct. 1, and German troops at once began occupying four designated zones within Czechoslovakia's strong strategic frontiers. Actually Hitler annexed much more Czech territory than

he had demanded in his first interviews with Chamberlain. Hitler then declared that he was satisfied: the Sudetenland represented his "last territorial ambitions in Europe. . . . We want peace." He praised the West Wall, denounced Winston Churchill and Anthony Eden as war-mongers, and castigated the "ever lurking threatening Jewish international world enemy which has found living expression in Bolshevism."

Anti-Semitic Outbreak.-From the time of his residence in Vienna before World War I, Hitler had been a fanatic hater of Jews and made anti-Semitism one of the chief platforms of the nazi party. After he seized power in 1933 he began a series of increasingly severe laws depriving the Jews of civil rights and economic opportunity. The worst outrage, however, prior to World War II (during which they were systematically exterminated by hundreds of thousands) occurred on the night of Nov. 10, 1938. A wave of destruction, looting and incendiarism swept over the whole reich. Bands of organized nazis set fire to all Jewish synagogues and destroyed some 500. They also toured the business streets, smashing the windows of Jewish shops and hurling furniture and goods of all sorts out onto the pavement. Thousands of Jews were roused from their beds, arrested and hustled to prison or concentration camps.

The pretext for this anti-Semitic outrage was the murder in Paris of Ernst vom Rath, a counsellor in the German embassy, by a young Polish Jew, Herschel Grynszpan, who was crazed by the news that his father and thousands of other Polish Jews were being brutally expelled from Germany. Goebbels brazenly declared that the attack on Jews was "the justifiable and understandable anger of the German people over the cowardly murder of a German diplomat in Paris." But there is no doubt that the outrage was deliberately planned and executed with the connivance of Goebbels himself, of Himmler and of other nazi radicals who wanted to whip up German fanaticism. It was also made the excuse for the imposing of a gigantic "atonement" fine of about \$400,000,000 on German Jewry as an easy means of filling the depleted nazi treasury. All Jews possessing more than 1,000 marks of property had to pay a capital levy of 20% in four quarterly instalments beginning Dec. 15, 1938.

Annexation of Bohemia-Moravia.-Despite Hitler's assertion after the Munich accord that, with the acquisition of the Sudetenland, his territorial ambitions in Europe had been satisfied, events soon proved the contrary. Within six months he resorted to the same methods against Czecho-Slovakia (as it was now designated), which had been greatly weakened by the loss at Munich of its natural strategic frontiers and defense fortifications, that he had pursued against Austria a year earlier. His press and radio denounced in violent language the "frightful maltreatment" of German minorities by the Czechs and the "intolerable" behaviour of President Eduard Benes. Even when Benes resigned in favour of the elderly Emil Hácha, in the hope of appeasing Hitler, the threats of force continued and were accompanied by intrigues for the complete dismemberment of Czechoslovakia.

In Slovakia, Hitler encouraged a movement for independence from Czech domination. Instigated by the nazis, the Slovak government at Bratislava (Pressburg) under the leadership of Premier Josef Tiso, a fascist Catholic priest, took a defiant attitude toward President Hácha in Prague. Conflicts between Czechs and Slovaks took place. On March 13, 1939, Premier Tiso flew to Berlin, conferred with Hitler and with Joachim von Ribbentrop, German minister of foreign affairs, and then flew back to Bratislava.

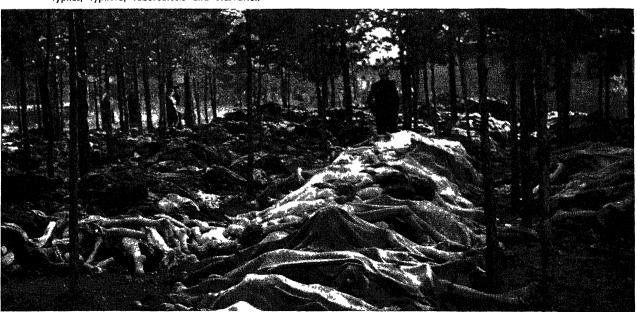

Rows of victims of Belsen concentration camp awaiting burial. Troops of the British 2nd army who liberated the camp on April 15, 1945, were reported to have found 29,000 persons dying of typhus, typhoid, tuberculosis and starvation

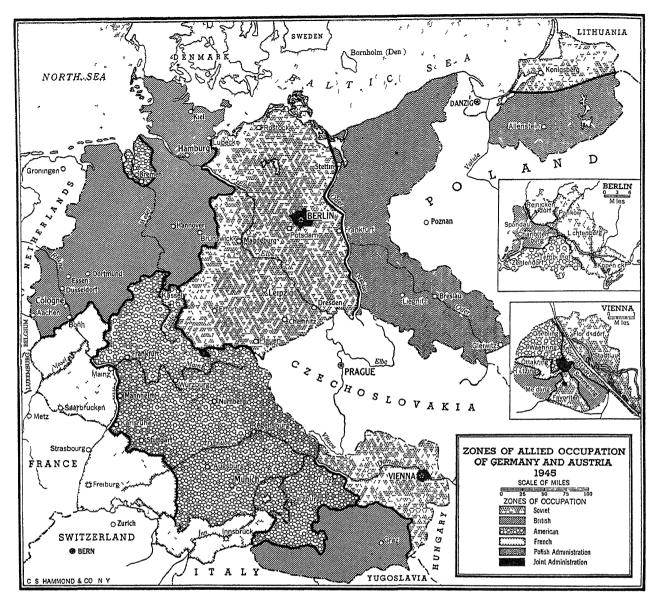

There he read to the Slovak diet, assembled in secret session, Hitler's promise to support their independence. The Slovak diet thereupon voted that Slovakia was completely independent of all Czech authority. In return, Hitler exacted from the new little puppet state the right to send German armies through it and to build German fortifications and garrisons in it along the frontier against Poland.

Meanwhile President Hácha, fearing that German troops were about to invade or bomb Czech territory, felt compelled to accept an "invitation" to see Hitler at Berlin. He arrived on Wednesday, March 15, at 1.10 A.M., and was put through a grilling interview mingled with threats from Hitler and Ribbentrop for four hours. Soon after 5 A.M. a German communiqué was issued stating that he had "trustfully laid the fate of the Czech people and the country in the hands of the Fuehrer of the German reich." Already German troops were across the frontier, marching into Bohemia on the pretext of "restoring order."

The territory thus acquired by Hitler was called the German "Protectorate of Bohemia-Moravia." It was placed under the administration of Baron Constantin von Neurath, formerly German foreign minister. Its German inhabitants, numbering less than 500,000, became German citizens with the same rights and duties as Germans in the rest of the reich. Its more than 6,000,000 Czech inhabitants were promised self-government and full opportunities for the development of their Czech culture. But these promises soon proved illusory, and Bohemia-Moravia was virtually annexed to the reich in fact if not in name. German officials and police swarmed into the country, and the Czechs were soon reduced to a kind of political and economic slavery. Thousands were removed from their homes to work in the mines and factories of the reich, and the Jews were subjected to great privations.

The seizure of Bohemia-Moravia considerably increased Hitler's military power. He took over all the Czech aeroplanes, the 40 divisions of the Czech army, and the valuable Skoda munitions works. He strengthened his eastern frontier by greatly shortening it. But he belied all his previous declarations that he wanted to add only Germans to the reich. His pretext for annexing 6,000,000 non-

German Czechs was, as he explained in his speech of April 28, that he feared Bohemia might become a landing field for Russian aeroplanes and thus be the spearhead with which communism would threaten western civilization. His act, however, had fatal consequences. It destroyed among his neighbours all remaining belief in his sincerity and honesty and put an end to appeasement policies. It crystallized the general European feeling, growing since the Munich accord, that no appeasement could satisfy him and that a "Stop Hitler" front must be formed. This took place when he made aggressive demands on Poland.

The Polish Crisis.—On March 22, 1939, a week after seizing Bohemia, Hitler annexed the Memel territory which before World War I had been a part of East Prussia and had later become part of Lithuania. At the same time he secretly renewed demands which had been privately made on Poland on Oct. 24, 1938, three weeks after the Munich accord, but which Poland had evaded answering. These demands included the return to the reich of the almost purely German population of the Free City of Danzig, and the cession by Poland of a strip of territory across the Polish Corridor to connect East Prussia with the rest of Germany. Such a strip would make possible a German railway and auto highway by which Hitler could

move troops rapidly by land into East Prussia for use against Poland or Russia, instead of having to ship them over the Baltic.

Poland, after witnessing Hitler's recent annihilation of Czechoslovakia, finally refused the demands. It naturally feared that to yield up control over Danzig and a strip across the Polish Corridor would simply increase Hitler's appetite for more territory, and would be merely the first step in an eventual further partition of Poland. Britain was informed, and on March 31, 1939, Prime Minister Chamberlain announced in the house of commons that "in the event of any action which clearly threatened Polish independence and which the Polish government accordingly considered vital to resist with their national force, his majesty's government would feel themselves bound at once to lend the Polish government all the support in their power. They have given the Polish government an assurance to this effect."

Hitler and his foreign minister, Ribbentrop, after the success with which they had "revised" the Versailles treaty and seized one territory after another without becoming involved in war, were foolishly convinced that the same thing could be done again in the case of Poland. They believed that by a war of nerves and threats of force

Poland could be bluffed into yielding and the Great Powers would acquiesce, and if they did not, Germany could make a lightning war (blitzkrieg) against Poland and win such a quick and complete victory that the other powers would be forced to accept the accomplished fact. After Munich Goebbels had proudly and publicly boasted: "We won, because we had the better nerves."

Accordingly, the German press and radio began a violent campaign to incite German opinion against Poland in order to strengthen nerves at home and to intimidate Poland and her supporters abroad. German newspapers rehearsed the "criminal injustice" of the Polish settlement at Versailles, the "frightful maltreatment" of the German minority in Poland, and the "intolerable provocations" of Polish leaders. Germany, it was now argued, needed more elbow room (lebensraum) and could not again tolerate Britain's aggressive "encirclement" policy. On April 28 in a radio broadcast Hitler made a "one and only solution" for the Polish question: if Poland would cede Danzig and the strip across the Polish Corridor, he would be willing to promise to guarantee Poland's western frontier and to sign a 25-year nonaggression pact with it. But in the same speech he declared that he no longer regarded as binding either the German-Polish treaty of friendship of 1934 or the Anglo-German naval pact of 1935, because by their attitude and conduct Poland and Britain had already nullified the treaties.

During the following months the international situation grew more tense. The "white war" of nerves increasingly threatened to turn into a red war of blood. The nazis deliberately provoked border incidents along the Polish frontier; in at least one case Germans disguised in Polish uniforms attacked a German outpost; and these were all played up vigorously in the German press and violently denounced by Hitler. Chamberlain patiently tried to find some peaceful solution, but at the same time made it very clear that if Hitler attacked Poland, Britain would stand by her promise to give Poland the fullest possible armed support. France followed Britain's lead. The great question mark was Russia's attitude. Britain and France sent a military mission to Moscow to win Stalin's adhesion to the "Stop Hitler" front, but they would not agree to Stalin's demand that he be allowed to take military control over the little independent Baltic republics of Estonia, Latvia and Lithuania, and Poland would not agree to his demand that Russian armies be allowed to march across Poland. Hitler, however, was quite ready to agree to these Russian demands, and so on Aug. 24, 1939, was signed a Russo-German pact of friendship and

Hitler then became more insistent to Poland, and at dawn on Sept. 1, without warning or declaration of war, German armies invaded Poland and World War II began. (See World War II.)

Germany's Initial Victories.—In spite of propaganda there was little enthusiasm at first among the German people. They were disappointed that Hitler had not succeeded in achieving his aims without plunging the country into war. They remembered Germany's defeat two decades earlier. They had already been under long strain and privation as a result of Hitler's rearmament program. But the amazingly rapid and complete victory over Poland quickly brought general rejoicing and confidence, especially as the British and French made no effort to invade Germany from the west. Hitler and Stalin were able to divide up Poland between themselves and consolidate their conquests without interference. In the three Baltic states Stalin got a military foothold and then forced them

after farcical elections to vote themselves into the soviet union. At the same time many thousands of Germans whose families had lived for centuries in Estonia, Latvia and Lithuania were uprooted, "repatriated," and settled by Hitler on lands from which conquered Poles were summarily expelled.

On April 9, 1940, after consolidating his position in Poland and finding that Britain and France would not acquiesce in the accomplished fact, Hitler suddenly launched his treacherous attack on Norway and Denmark. A month later his armies swept over the Netherlands, Belgium and northern France. Though Britain's armies were defeated in France, Britain itself was saved by the English channel, by indomitable courage, by the heroic withdrawal from Dunkirk and by the royal air force.

In the spring of 1941 Hitler's armies made a quick and easy conquest of Yugoslavia and Greece and even occupied Crete by airborne troops. But this Balkan diversion caused a fatal three-months delay in his supreme act of folly—the invasion of Russia on June 22, 1941. His armies crowded the Russians back over their limitless plains and eventually reached the outskirts of Leningrad, Moscow and Stalingrad. But in spite of desperate fighting and great losses Hitler could not capture these Russian strongholds. Stalin managed to escape a crushing defeat for the Red armies by withdrawing eastward and by removing many of his munitions works to the Ural Mountains regions. The German armies did penetrate in the south to the Caucasus mountains, gained control of some of the valuable oil wells, and hoped to push on through the near east to attack Egypt and the Suez canal.

This vital British region was also menaced by a German-Italian force under General Erwin Rommel advancing eastward across North Africa, thus threatening to crush the British in Egypt by a great German pincers movement from east and west. But before the pincers could close, the tide of war turned.

These great victories of 1939-42 brought vast areas under Hitler's control and provided food, raw materials and manpower which to some extent bolstered Germany's economy. As a consequence, the German people enjoyed a considerably better standard of living than the conquered lands during these years.

Prisoners of war were made to work in German fields and factories, and millions of workers in the conquered countries were forced to come to Germany and labour under hard conditions as the only alternative to starvation or the concentration camp.

By his so-called "New Order," Hitler sought to bring nearly all Europe under a centralized economic control directed from Berlin. Germany was to become not only an arsenal of munitions but also an even more highly industrialized country than hitherto. By enforced trade agreements and exchange controls it would be supplied with needed food and raw materials from the conquered lands which would be reduced mainly to an agricultural economy and be made incapable of developing armaments for a possible revolt against the nazi masters. This ruthless economic exploitation of the conquered lands and the brutal and inhuman tyranny of the nazi police prevented any possibility that the vanquished might become reconciled to German rule. On the contrary, the great majority of the conquered populations felt an intense bitterness and built up secret underground "partisan" opposition movements. These, however, were able to accomplish little until Hitler's armies began to suffer defeats

erators.

Germany. The food shortage in that city reached acute proportions
during the winter of 1945-46

and until the Allies began to advance as liberators.

Downfall, 1943-45.—Hitler's own obstinacy and dictation of strategy disapproved by his more prudent generals contributed to his disastrous defeats in Russia. He stubbornly refused to draw back his armies after powerful Russian counteroffensives threatened to make his position untenable. On Jan. 31, 1943, after very heavy losses in the futile efforts to capture Stalingrad, Field Marshal Friedrich von Paulus and what was left of his army of 330,000 officers and men were compelled to surrender to the Russians. This disaster was a serious blow to German prestige and to Germany's position in Russia. Gradually the German armies were driven out of the Caucasus region, the Crimea, and the rich Ukraine and compelled to retreat toward Berlin.

Meanwhile, on Oct. 23, 1942, General Rommel was defeated at El Alamein on the frontier of Egypt and was forced to flee westward for 1,000 mi. through North Africa to Tunisia. On November 8 an immense British and American amphibious armada landed Allied forces in Northwest Africa. These secured some co-operation from the French and pressed eastward to strike at Rommel's retreating Africa corps. What was left of it-about 267,000 Germans and Italians-finally surrendered in Tunisia on May 13, 1943. The German pincers threat to Egypt had come to an ignominious end. British and U.S. ships could move more safely through the Mediterranean. On the night of July 9-10, 1943, another tremendous Allied armada landed troops in Sicily, drove out the Germans, and then crossed to the Italian mainland to free the country from the nazi grip after Mussolini had been overthrown on July 25.

Allied bombing of Germany, which became severe in 1942, was greatly intensified during the next three years as

a preparation to the Allied invasion of Germany itself. From April 1 to Dec. 5, 1943, giant British and U.S. planes rained down more than 250,000 tons of explosive and incendiary bombs, killing 124,630 persons, according to German figures, and doing great damage to German industrial centres. But this was slight in comparison to the terrific pounding inflicted on the country in 1944 and early in 1945. Allied bombing was largely concentrated on industrial and munitions plants, railroads, bridges and canals, and synthetic gasoline works and dumps. The German transportation system was so completely disrupted that Hitler was unable to move his troops rapidly to threatened points after the Allies opened a second front in Europe by the successful landing in Normandy on June 6, 1944. The German gasoline shortage became so acute that Hitler's luftwaffe and motorized equipment were rendered almost useless. This Allied bombing partly explained the rapid collapse of Germany's forces as the Allies invaded Germany itself in the winter of 1911-45 after liberating the peoples in the nazi-conquered lands.

On April 30, 1945, as the Russians were battling into the streets of Berlin, Hitler and Goebbels committed sucide, and their example was later followed by Himmler and several other nazi leaders. On May 7 the Allied terms of unconditional surrender were signed by German officers at Rheims and confirmed the next day in Berlin Admiral Karl Doenitz acted as Hitler's successor as head of the reich for three weeks, but on May 23 he and some 300 other highest officers and civilian officials were taken into custody at Flensburg in Schleswig. This marked the final end of the third reich which Hitler had boasted would last 1,000 years.

Allied Military Government.-On June 5, 1945, the Allies announced that Germany west of the Oder would be ruled for an indefinite period in four military zones administered respectively by U.S., British, Russian and French authorities. Greater Berlin (341 sq.mi.) was to be jointly administered by a quadripartite board whose presiding officer was to rotate monthly between the four occupying powers. Unity of administration for all Germany in such matters as transportation, posts and telegraphs, tariffs and other economic matters was to be secured as far as possible by a Four-Power Control board sitting in Berlin. But as it could act only with the unanimous agreement of all four powers, its efficiency was very much hampered. Russia continually blocked proposals of the western democracies, and France was unwilling to see central German administrative agencies set up until the industrial Ruhr area was put under international control or in some way deprived of German control and the possibility of a revival of Germany's armaments. Germany thus remained badly handicapped both politically and economically, and each of the four Allied powers pursued different policies in their respective zones. In the autumn of 1946 the U.S. and British authorities, despairing of any immediate unity of administration in all four zones, took steps to unify the administration of the U.S. and British zones, leaving the way open for the Russians and French to adhere to their arrangements.

The U.S. zone (43,136 sq.mi.) comprised Bavaria and west central Germany, including parts of Wuertemberg, Baden, Hesse and Nassau, and also an enclave territory around Bremen within the British zone through which the U.S. could ship in supplies for its military government forces and officials. The U.S. zone had a well balanced economy with both industry and agriculture, but was burdened with a great number of "displaced persons" and German deportees from regions east of the Oder. Denazification was carried out more completely in the U.S. zone than elsewhere. Fraternization of U.S. troops with the German population was at first forbidden, but later permitted because the prohibition was difficult to enforce.

The U.S. zone took the earliest and most complete steps for organizing democratic self-government among the Germans. Elections of officials were held successively in villages, districts, and large towns, and finally delegates were elected to constitutional conventions in each of the three "Lands" or states created in the American zone as possible member units in a later federal German government (Bavaria, Wuertemberg-Baden and Greater Hesse). On Oct. 24, 1946, the constitutional convention of Wuertemberg-Baden adopted a constitution as more or less of a model for the other two states. It provided for a legislature (Landtag) of 100 members elected for 4 years. The premier was to be chosen by the legislature for four years, but could be forced to resign by a vote of no confidence, while the legislature itself could be dissolved by a plebiscite before its term was up. A detailed bill of rights protected freedom of speech, the press, religion, assembly and equality before the law.

The British zone (36,869 sq.mi) was made up mostly of Prussian territory, and stretched across north Germany from Luebeck and the Baltic sea to the Dutch and Belgian frontiers. It included the highly industrialized Rhine-Westphalian area, so that the British were naturally more inclined than the other Allies to aid German industrial recovery, in order to furnish employment and to produce

Occupation troops driving jeeps through the streets of Frankfurt, Germany, during the parade which marked the first anniversary of V-E day in May 1946

needed manufactures and exports with which to pay for food and raw materials from abroad.

The relatively small French zone (21,558 sq.mi.) included two triangular districts separated from each other: southern Baden and western Wuertemberg in the southwest; and the Saar and Rhineland in the west. The French aimed to link their zone politically and economically as closely to France as possible.

The Russian zone (41,339 sq.mi.) lay largely between the Oder and the Elbe rivers, and included all or part of Brandenburg, Mecklenburg, Pomerania and the industrial Saxon and Thuringian territories. The Russians at once carried off great amounts of industrial equipment from their zone, and began to divide up the great estates in order to create small farms. They ruled their zone by totalitarian methods. They brought back numerous German Communists who had been living as refugees in Moscow

during the war and placed them in all the best positions. They forced the Social Democrats to unite with the Communists to form the so-called Socialist Unity party. But these totalitarian methods so antagonized the people of Berlin that the Russian-backed Socialist Unity party was badly beaten in the Berlin elections for the city council held under quadripartite supervision on Oct. 20, 1946. The provisional returns showed the following vote: Social Democratic party, 947,440; Christian Democratic union, 442,837; Socialist Unity party, 389,783; Liberal Democratic party, 179,761. The women's vote was decisive, since from an electorate of 2,363,000, of whom 83% went to the polls, about 1,400,000 were women and only 900,000 were men. Gerow, Leonard T.

Gerow (1888-), U.S. army officer, was born July 13, 1888 in Petersburg, Va. He was graduated from Virginia Military institute, Lexington, Va., in 1911, and was commissioned a 2nd lieutenant in the U.S. army. He served in the Mexican campaign and went overseas with the U.S. expeditionary forces to France in 1918. Following the end of World War I, Gerow was stationed in Shanghai and the Philippines. He was chief of staff of the war plans division under Gen. George C. Marshall at the time of the Pearl Harbor attack, and was promoted to the rank of major general in Feb. 1942. He went to England in July 1943 as the commander of U.S. field forces; the following year he was named commander of the U.S. 5th corps. Gen. Gerow participated in the Normandy landings in the summer of 1944, the drive on Paris, the battle of Aachen and the Ardennes campaign in the winter of 1944-45. In Jan. 1945 he was promoted to the temporary rank of lieutenant general. The following March he was assigned to form a new army, the U.S. 15th, which was subsequently designated as the army of occupation for the U.S. zone of Germany. He left the command of the 15th army in July to become head of a board of U.S. officers charged with making a detailed study of the war.

Testifying before the congressional committee investigating the Pearl Harbor attack, Gerow accepted responsibility for the army's failure to strengthen the defenses at Pearl Harbor in spite of warning of a possible Japanese attack.

Ghavam-es-Saltaneh, Ahmad

Ghavam-es-Saltaneh (1872?—), Iranian statesman, was born of an artistocratic landowning family and inherited vast estates in Azerbaijan province. He held his first cabinet post in 1910 and was governor general of Korasan province in 1918. Ghavam was premier from June 1921 to Jan. 1922 and from June 1922 to Feb. 1923. Following his second tenure, he was banished from the country on a charge of plotting against the life of Riza Khan Pahlavi. Permitted to return in 1929, he re-entered public life and again held a number of important cabinet posts. He returned as premier in June 1942, but was forced to resign in Feb. 1943 because of the Tehran bread riots in which his home was pillaged and burned.

On Jan. 26, 1946, the Iranian parliament, by a one-vote margin, named Ghavam as premier for a fourth time. Ghavam thereupon entered direct negotiations with the U.S.S.R. to resolve the Azerbaijan dispute and visited Premier Joseph Stalin in Moscow (March 1946) to discuss the overdue withdrawal of Red army troops from Azerbaijan. On March 15, 1946, he notified the Big Three that he intended to appeal to the United Nations security council against continued presence of Red army troops on Iranian soil. Later, Ghavam announced (April 5, 1946), in a communiqué issued jointly with the soviet ambassador to Tehran, that the U.S.S.R. and Iran had reached complete agreement on all matters.

Ghormley, Robert Lee

Ghormley (1883–), U.S. naval officer, was born Oct. 15, 1883, in Portland, Ore. He was graduated from Annapolis in 1906 and was in command of U.S. forces during the Nicaraguan campaign of 1912. During World War I he was decorated for his work as assistant director of the overseas division of the naval overseas transportation division. He was appointed assistant chief of staff to the navy's commander in chief in 1931, and the following year headed the tactical section (fleet training division) in the office of the naval operations chief. Made a rear admiral in Oct. 1938 and a vice admiral in 1941, Ghormley was ordered to Auckland, N.Z., in April 1941 to set up a joint U.S.-New Zealand naval command and was appointed commander of Allied land, sea and air forces in a South Pacific zone. Adm. Ghormley directed the landing of marines on the Solomon Islands on Aug. 7, 1942, and the ensuing land-sea-air operations there until Oct. 24, when he was relieved by Vice-Adm. William F. Halsey. He was Hawaiian sea frontier commander from March 1943 to Nov. 1944, when he joined Adm. Stark's staff in London. On May 16, 1945 he was named commander of U.S. naval ports and bases in Germany. Adm. Ghormley announced his retirement April 19, 1946.

Gibraltar

A narrow peninsula situated at the western outlet of the Mediterranean, Gibraltar runs southwest from the southwest coast of Spain and consists of a long, high mountain known as "The Rock" and a flat sandy plain, raised only a few feet above the level of the sea, to the north. Area, 17% sq.mi. Language: mainly Spanish. Religion: mainly Roman Catholic. Civil pop. 1931, 17,613; 1938, 20,138.

Governors (with dates of assumption of office): General Sir Charles Harrington (Oct. 20, 1933); General Sir Edmund Ironside (Nov. 9, 1938); Lieutenant General Sir Clive Liddel (July 11, 1939); General Viscount Gort (May 14, 1941); Lieutenant General Sir Noel Mason MacFarlane (June 19, 1942); Lieutenant General Sir Ralph Eastwood (after Feb. 27, 1944.)

No event of special importance occurred at Gibraltan between 1937 and the outbreak of World War II. Nor was the colony greatly affected during the opening months of the struggle; but the spread of hostilities to the Mediterranean, consequent upon Italy's entry into the war in June 1940, created an entirely new situation. The British government found itself under the imperative necessity of placing the fortress in a state of adequate defense. The attitude of Spain, under the Franco regime, was equivocal from the first; and it was always doubtful how far the Spanish authorities could be relied upon to resist any plans that the Germans might have in contemplation (it became known after the war that they did in fact form such plans) for attacking Gibraltar through the Spanish territory.

In some respects Gibraltar was not well-prepared to resist an assault. It had suffered from overcrowding for many years, and the position had been aggravated by an influx of refugees during the Spanish civil war. It was essential, as a matter of military precaution, to remove "useless mouths" from what might, almost at any moment, become a beleaguered fortress. About 11,000 Gibraltarians were landed in England by the middle of Aug. 1940. Some 2,000 others, mainly persons able to make their own arrangements, proceeded to Madeira, while about 1,500 were sent direct to Jamaica. In all, the total number of persons evacuated amountéd to 16,700. The evacuees in England were concentrated in London. The process of repatriation began in March 1944 but had not gone far when the flying bomb attacks on London necessitated the removal of the evacuees to Northern Ireland. By the middle of Jan. 1946 the number of persons repatriated to Gibraltar was more than 12,000; the return of the remainder was contingent upon the progress made with local building schemes. As events turned out, the threatened attack on Gibraltar never developed; but, so long as hostilities continued in the Mediterranean, the colony remained in a state of acute military tension.

Gilbert Islands

A group of 16 Pacific islands which played a brief but memorable role in World War II, the Gilbert Islands were the scene of one of the hardest battles in the history of the U.S. marines. A British protectorate after 1892 and a crown colony after 1915, the Gilbert and Ellice Islands colony in 1938 was enlarged by the addition of the Phoenix Islands.

The islands in this part of the Pacific had until this time received little attention, but their strategic importance now began to be realized. Their position directly south of the Japanese mandated islands, and on the air route to Australia, led to contention between the United

States and Great Britain as to sovereignty over two of the Phoenix Islands—Canton and Enderbury. Agreement was reached in 1939, when these two islands were placed under Anglo-U.S. condominium and Canton became a station of Pan American Airways.

However, little was done to fortify any of the islands and the three most northerly Gilberts fell an easy prey to Japan on Dec. 9, 1941, two days after war began in the Pacific. The next day Tarawa was raided and looted, but not occupied until some months later. The Japanese did not invade the Ellice Islands. Allied forces took advantage of this neglect in March 1943 when they occupied Funafuti, principal Ellice atoll, and there organized for the historic attack upon the Gilberts on Nov. 20, 1943.

On the second day of the battle of Tarawa (see below) the British resident commissioner of the Gilbert and Ellice Islands colony, Lieut. Col. Vivian Fox-Strangways, came ashore. In a dual ceremony the U.S. flag was run up to signalize the victory of the U.S. navy, and the British flag to mark the resumption of British civil control. The islands were thenceforth used as a base for the further advance upon the Marshalls. (See also Pacific Islands, British.)

(W. PE.)

U.S. Operations in the Gilbert Islands.—The capture of the Gilbert Islands from the Japanese in Nov. 1943 was a necessary preliminary to the capture of the Marshalls. It cleared the area of Japanese and brought the islands back under British rule. U.S. long-range, land-based aircraft moved to positions from which they could conduct the photographic and other reconnaissance of the Marshalls needed for further amphibious operations. These planes could prepare for and support such operations by bombing raids on the Japanese bases.

Three atolls in the Gilberts—Makin, Tarawa and Apamama—were selected for U.S. capture and development. Of these, Makin was lightly fortified and held by only about 450 Japanese. It had no airfield and was 200 mi. south of Mili and Jaluit, the nearest Japanese bases in the Marshalls. Tarawa, 100 mi. south of Makin, was the centre of Japanese strength. Betio Island of Tarawa atoll was strongly fortified; it had an air strip and a garrison of

about 4,000 troops. Apamama, 60 mi. south of Tarawa, was undeveloped and was occupied by a token force of 25 Japanese, who killed themselves when the U.S. marines landed. On islands of all three atolls airfields could be built. Makin and Tarawa lagoons had fair anchorages, but Apamama lagoon had insufficient depth of water for large ships.

The 165th infantry of the U.S. 27th division, which had been training in the Hawaiian Islands, was selected to take Makin. The 2nd marine division, which was recuperating at Wellington, N.Z., after Guadalcanal, was designated to take Tarawa. Naval support, made up of aircraft carriers, battleships, cruisers, destroyers, transports and amphibious shipping of all kinds, required everything available in the U.S. Pacific fleet. U.S. army heavy bombers, operating from air fields on three islands in the Ellice group and from Canton and Baker Islands, belonged to the 7th air force.

Funafuti Atoll, in the Ellice group, with an excellent anchorage and an air strip, lay 700 mi. southeast of Tarawa and was the nearest U.S. advanced base. Canton Island, with excellent air facilities but no anchorage, was more than 900 mi. to the eastward of Tarawa, with its staging field on Baker Island advanced 300 mi. toward the Gilberts.

The landings on Makin and Tarawa were scheduled to take place on Nov. 20, 1943. Before daylight on that day there was a great assemblage of ships of many types off those atolls. The ships had started from various places thousands of miles apart—the Hawaiian Islands, Samoa, the Ellice Islands, New Zealand and the New Hebrides. The fast-carrier task force had arrived in the area two days earlier to cover the movement of the transports and to make preliminary air strikes and bombardments on the Japanese positions.

At Makin the U.S. landings encountered light opposition and the island was captured with small losses. At Tarawa, however, the Japanese opposition was very strong and effective. Betio Island, which had the air strip and which commanded the entrance to the lagoon and the anchorage, was a mass of interlocking defensive positions.

Aftermath of casualties and destruction following the savage battle for Tarawa in Nov. 1943

some of heavy concrete, some underground and many reinforced with coconut logs. Underwater obstructions and mines blocked the seaward beaches of the island. Guns, ranging in size from 8 in. down, were emplaced so as to command all approaches to the island.

The assault started at daylight with naval bombardment and bombing, followed after several hours by landings made through the lagoon over the fringing coral reef on the inside of the island. The first wave of troops embarked in amphibious tractors were able to advance over the reef in the face of heavy fire until they reached the beach. Succeeding waves, however, were embarked in boats which grounded on the reef some distance from shore. These troops had to disembark in the water and wade ashore, with resulting heavy casualties. The landings had been timed for high tide, but an unpredictable phenomenon, known locally as "dodging tides," occurred, which prevented the normal high water from covering the reef.

Betio Island was captured, and the other islands extending for 20 mi. around Tarawa atoll were cleared of Japanese, after 4 days of very bitter fighting. U.S. casualties ashore amounted to nearly 1,000 men killed on Tarawa, and about 70 killed on Makin. Further U.S. losses occurred when the escort carrier "Liscome Bay" was torpedoed by a Japanese submarine off Makin early one morning with the loss of about 700 men. Japanese killed during the operation were estimated at about 4,000. Valuable lessons were learned at Tarawa as to the best methods for assaulting and capturing heavily defended island positions with a resulting saving of many lives in later operations.

The capture of the Gilberts was an important first step in clearing the Japanese from the island strongholds with which they blocked the central Pacific approaches to Japan and north China—the Marshalls, Marianas, Carolines, Iwo Jima and Okinawa. It was the start of the northern prong of the two-pronged offensive which crushed Japan. (R. A. SE.)

Gilroy, Norman

Cardinal Gilroy (1896-), archbishop of Sydney, Australia, was born in that city on Jan. 22, 1896. At 18 he left Marist Brothers college, Kogaral, to take a position in the telegraphic department of the postmaster general's office. He enlisted in World War I and served as radio operator on a troopship. Entering a seminary immediately after his discharge from service, he was ordained priest in 1923 and went to the Urban College of Propaganda in Rome to complete his studies. He became secretary to the apostolic delegate to Australia in 1924 and to the bishop of Lismore in 1931. He served as chancellor of the diocese of Lismore from 1931 to 1935, when he was named bishop of Port Augusta. Elevated to the position of co-adjutor archbishop of Sydney with the right of succession in 1937, he was designated archbishop on March 8, 1940. He conducted a vigorous campaign against the legalization of the Communist party of Australia, a proposal which had been sponsored by the extreme section of the trade unions and other organizations. Created a cardinal by Pope Pius XII on Feb. 18, 1946, he was the first of Australian birth to attain this rank.

Giraud, Henri Honore

Giraud (1879—), French army officer, was born Jan. 18, 1879, in Paris and attended St. Cyr Military academy and the École Supérieure de Guerre. Early in World War I, he was wounded and captured by the Germans, but escaped in 1915 and returned to the front. Toward the end of the war he was chief of staff of a Moroccan division. He participated in the Riff campaign until the surrender of the Riff leader, Abd-el-Krim, in Jan. 1926.

After the German break-through at Sedan in May 1940, General Giraud took command of the Allied armies in northern France, but he and his staff were captured and interned in Koenigstein prison, Saxony. In April 1942, Giraud staged another daring prison break and escaped to Vichy via Switzerland. He soon fled Vichy and offered his services to the U.S. armies at the start of the North African campaign. In Nov. 1942 Giraud was named commander of all French armed forces in North Africa; after Admiral Jean Darlan's assassination the following month, he became high commissioner of French North Africa.

During 1943 Giraud and De Gaulle engaged in a struggle for power. On Feb. 6 Giraud assumed the title of French civil and military commander in chief in North Africa. He severed all ties with Vichy and pledged restoration of free republican rule in France after the war. By the summer of 1943, however, his popularity had ebbed, although he had the backing of the U.S. state department and Great Britain, the majority of Frenchmen supported De Gaulle. Giraud finally invited his rival to Algiers and on June 3, 1943, a new governing body for anti-Vichy France was created with de Gaulle and Giraud serving as co-presidents. Subsequently Giraud lost ground to De Gaulle. In Nov. 1943 he resigned as co-president of the French Committee of National Liberation, and in April 1944 his position as commander in chief was abolished and he was retired. He left Algiers in Oct. 1944. After the Allied victory, Giraud participated in local French politics and was elected to the French National assembly for Metz on June 2, 1946.

Glasgow

City, county, royal burgh and port of Lanarkshire, Scotland, Glasgow is situated on both banks of the Clyde. Pop. (est. 1940) 1,131,800 (1938 census, 1,127,825). By 1937, Glasgow was recovering from the effects of the serious depression of the early 1930s. The west of Scotland, which had concentrated largely on the heavy industries, had suffered more acutely than many other areas. Unem-

479

ployment, which had reached the figure of 131,820 in 1933, was reduced to 73,515 in 1937, and by 1939 fell further to 58,314. This improvement reflected to some extent the general recovery throughout the world but was also partly caused by the government's rearmament program.

In 1938, the empire exhibition was staged at Bellahouston park. The purpose was to display the products of Scotland and the British empire generally and also to demonstrate the cultural and artistic activities of the various countries taking part; 12,593,232 people visited the exhibition during its six months' existence. The later months were overshadowed by the threat of war, and during the following year the city became increasingly concerned in preparations to meet this danger.

During World War II the city suffered a number of air attacks, the most severe of which took place on the nights of March 13 and 14, 1941. Altogether, 848 persons were killed and 1,811 wounded during the various raids, and 21,962 buildings were destroyed or seriously damaged.

In the field of war production, the record of Glasgow and Clydeside was impressive. Nearly 200,000 people were engaged in the shipbuilding and aircraft industries, and many more were employed in the manufacture of tanks, guns, etc. During the greater part of the war the Clyde was the chief port in Great Britain, and vast quantities of material and large numbers of men passed through Glasgow, including contingents of the U.S. and Canadian armies. The most dramatic single incident of the period was the parachute descent and capture of Rudolf Hess on the outskirts of Glasgow on May 10, 1941.

With the war at an end, the industrial activity of the city slackened to some extent, and unemployment figures rose. Efforts to attract light industries and an appreciation by the government of the strategical advantages of the geographical situation of Glasgow would, it was hoped, ensure a prosperous future. (H. McN.)

Glass

Glass was more profoundly affected by World War II than by any other influences during the decade 1937–46. Not only were many factories damaged or destroyed in the European countries, but the character of production and research was necessarily geared to military requirements, and manufacturing was seriously handicapped everywhere by virtual stoppage of international trade and by shortages of fuel, labour, and materials. Cooperation among glass technologists of different countries, fostered by such events as the Glass congresses of 1933 and 1936, ceased perforce.

In England, the Glass delegacy, implemented by research at the Department of Glass Technology, University of Sheffield, maintained development and production at a high level despite handicaps. Great credit for progress in this period, as in two decades preceding, must be given to Prof. William E. S. Turner, head of the department at Sheffield, who as teacher, director of research, editor and consultant became the leading figure of the decade in glass technology.

Many English factories were damaged by bombing. The cessation of imports required the beneficiation of British sands to replace imported sands, and other materials were in short supply. Nevertheless, optical glass was made sufficient for military needs, window glass was produced to replace much that was broken by bombing, and numerous researches and technical developments were carried out. Among the latter may be mentioned further improve-

ment in the Pilkington process of continuous plate-glass manufacture, in which progress was made in the attempt to grind both sides of a plate simultaneously and polish in a similar manner.

In Germany and elsewhere in Europe, glass plants suffered heavy damage during the war. German production was governed almost exclusively by military needs. Substitutes had to be found for some of the ordinary fuels and raw materials.

Several important technological developments reached the production stage in the United States during this period. "Foam glass," a cellular product weighing less than ten lb. per cu.ft., was a new superior heat insulation for many purposes, and replaced cork in life rafts and buoys. Early work on this product was done by Bernard Long, in France. "Vycor," a high-silica glass invented by M. E. Nordberg and H. P. Hood of the Corning Glass Works, could not be broken by thermal shock, and formed superior laboratory apparatus. Lightweight bottles, made by improved techniques in numerous plants, economized cost and freight. Nonreflecting films, produced on lenses by several methods, increased speed and definition in photography.

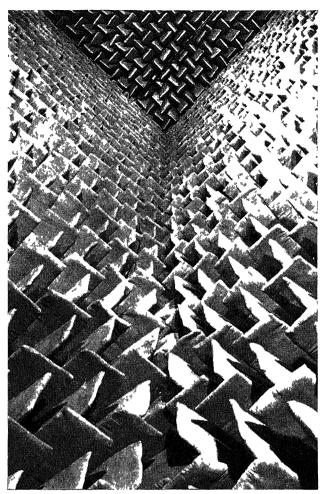

Advances were made in uses of glass fibres, which could be spun into threads for yarns and fabrics, replacing animal and vegetable fibres for some purposes. One promising material was a plastic re-enforced by glass fibres to produce a remarkably strong composite material.

In marked contrast with 1917, the beginning of World War II found the United States fully prepared to make optical glasses for all needs of the armed forces. Glasses for bulbs and tubes for radio and radar were ready as these techniques expanded.

The technique of toughening glass by prestraining or disannealing were improved and applied to cooking utensils, automobile glass, heavy plate glass doors, and bulletproof glass for military uses. Cups and dishes for army mess halls were so heat-treated as to have at least three times ordinary impact resistance. Safety glass for automobiles became standardized with superior plastics for the intermediate layer and polished plate glass ½ 2-in. thick for outside layers. "Multi-form glass" (Corning), made in tiny or intricate shapes by pressing powdered glass mixed with a binder and then heating the product to weld the particles, served for insulators and other small parts not otherwise possible to fabricate from glass. Precision gauges of glass surpassed metal gauges in accuracy and low cost.

The application of a more sound engineering principle to the design of bottles, whereby the sides met the bottoms in smooth curves instead of squarely, improved their resistance to impact and pressure as well as their appearance.

In tank-furnace construction, ports of greater width provided better flame coverage for the heated bath and batch. The suspended back wall (Simplex) was an innovation that allowed the batch to be fed in a continuous blanket across the tank. These steel-hung bricks were also applied as a suspended shadow wall, replacing the trouble-some jack arch dividing melting chamber and drawing chamber in flat glass tanks. Cast-mullite (Corhart) blocks to retain the molten glass were improved and continued to show superiority over clay blocks for some melting units. The still more refractory cast-alumina "Monofrax" (Carborundum Co.) blocks made their appearance. New fuel gases, represented by propane, were used as cheaper fuels became occasionally scarce. Air for combustion was fed to the furnaces by fans instead of by natural draft.

Twenty thousand fiberglas stalactites lining the walls of the "anechoic" (echo-free) chamber at the Harvard electro-acoustic laboratory where problems of reducing noise in aeroplane cabins and improving high altitude communication were solved with success during World War II

Research on glass in the United States expanded in scope and facilities. Corning Glass works, Owen-Illinois Glass Co., Libbey-Owens-Ford and Owens-Corning Fiberglas were among companies installing new and wellequipped laboratories. Glass Science, Inc., was established for research apart from industrial application. Refined methods for estimating density emerged as effective tests for control of composition. Investigations by X-ray of atomic arrangement in glasses established the fact of absence of crystalline structure and led to interesting ideas about the constitution of glass. Silica-free glasses of unusually high index of refraction were developed by George W. Morey. Glass compositions promoting faster production and better quality appeared in containers and flat glass. New optical glasses and optical systems aided in particular aerial photography.

The literature of glass expanded as never before. In 1938, Morey's Properties of Glass brought together all of the important facts about glass that had previously been established. Members of the Glass Division, American Ceramic society, used its Journal and Bulletin for reporting many researches; its Geramic Abstracts covered other papers from periodicals all over the world. The Journal of the Society of Glass Technology continued, in spite of the war, to hold its leading position in the publication of abstracts and original papers. The Glass Industry (New York) and Ceramic Industry (Chicago) reported news

of the industry, inventions and occasional researches, while the *National Glass Budget* (Pittsburgh) continued its faithful week-by-week recording of trade conditions. Several German journals continued publication well into the war period. However, Heinrich Maurach, the leading editor, was antinazi and was obliged to give up his work.

During the decade, production of glassware of all sorts in the United States reached high tonnage and record value. The scarcity of tin during the war created enormous demand for glass bottles and containers to replace tin cans for the preservation of food. At the same time, production of closed automobiles practically ceased, and new construction of dwellings and other civilian buildings was at a low ebb. Accordingly, the demand for polished plate glass declined. Comparative figures for the period show the changes in rates of production:

Type Polished Plate	1937	1911	1945
Glass, sq.ft. Bottles and Con-	208,000,000	190,400,000	102,000,000
tainers, Glass Window Glass, sq.it.	53,000,000 570,000,000	70,400,000 820,000,000	99,700,000 no data

The increase in window glass production between 1937-41 resulted from two main causes: the construction of barracks for troops, and the lack of imports from countries like Belgium.

Figures released by the U.S. bureau of census for 1942 show the melting capacity of various units:

	Pot Furnaces	Day Tanks	Continuous Tan!
Number Installed	202	282	610
Number of Pots	1,536		•
Tons of Product			
per year	80,000	35,000	5,000,000
Potential Annual			
Production, Tons	143,000	87,000	6,300,000

In 1941, the American glass industry consumed 1,000,000 tons of coal, 80,000,000 gal. of fuel oil, 80,000,000,000 cu.ft. of natural gas and other clean gases, and 1,000,000,000 kw.hr. of electrical energy.

The value of glassware of all sorts produced annually in the United States doubled during the decade, rising from \$280,000,000 to \$570,000,000. Prices rose comparatively little. The consumption of sand reached 3,500,000 tons by 1945, and of soda ash, 1,250,000 tons, or one-fourth the total made. Actual deficiency of soda ash for glassmaking resulted. The number of operating factories remained fairly constant, around 250 for the entire period. The industry became almost completely unionized. The high degree of mechanization was reflected in the fact that wages amounted to only one-fourth the value of the product.

By the consolidation of companies, four or five (of the United States) corporations came into control of the container industry. One corporation, through ownership of patents, controlled all practical methods of producing bottles by machinery. This condition formed the basis of an antimonopoly suit which was bitterly contested for about five years. The trial court decree ordered relinquishment of mutual stock holdings by the corporations involved, and directed open licensing, without royalty, of feeder, forming machine, lehr, and other patents. An appeal to the U.S. supreme court brought about certain modifications of the original decree, but the industry was left in a more competitive condition. (See also STANDARDS, NATIONAL BUREAU OF.)

482 Bassin) (1937); S. Waugh, Art of Glassmaking (1937), O. Voelkers, Glas und Fenster (Glass and Windows) (Berlin, 1939); G. W. Morey, Properties of Glass, (1938); S. R. Scholes (ed.), Handbook of the Glass Industry (1941); C. J. Phillips, Glass: the Miracle Maker (1941). (S. R. S.)

Glassford, William Alexander II

Glassford (1886—), U.S. naval officer, was born June 6, 1886, in San Francisco. He was graduated from the U.S. Naval academy in 1906, and during World War I served as a gunnery officer on a destroyer and later as an executive officer on a destroyer tender. He won the D.S.M. for bringing the destroyer "Shaw," of which he was commander, safely into port after a collision with a British vessel. During the period from 1924–35, he was assistant director of naval communications, staff member of the Naval War college, commander of the battle force and commander in chief of the U.S. fleet.

After Japan attacked Pearl Harbor, Glassford, who was commander of the Yangtze patrol, was placed at the head of the newly organized Southwest Pacific naval command in Feb. 1942. Later that month, he participated with the Dutch fleet in the battle of the Java sea. He was then given the post of commandant of the 6th naval district and Charleston navy yard. In May 1943 Adm. Glassford, who had negotiated the agreement with the French authorities opening Dakar to U.S. naval forces, was appointed Pres. Roosevelt's personal representative, with the rank of minister, to French West Africa. At the same time, he was promoted to the rank of vice-admiral. In Aug. 1944 he was sent to London with a naval mission to prepare plans for the demobilization of the German navy; he was also charged with the administration of U.S. naval affairs in liberated Europe.

Glennon, John Joseph

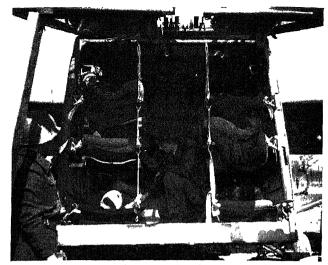

Cardinal Glennon (1862-1946) archbishop of St. Louis, was born at Kinnegad, County Meath, Ireland, on June 14, 1862. He was ordained at Kansas City, Mo., 1884, and served as vicar general of the diocese of Kansas City. Consecrated titular bishop of Pinara and coadjutor bishop of Kansas City June 29, 1896, he was transferred to St. Louis as coadjutor to the archbishop, April 27, 1903, and became archbishop of St. Louis Oct. 13, 1903.

World War I saw the intensification of Archbishop Glennon's already amazing activity. He had frequently expressed the hope that the United States might be spared the disasters of war, but once war was declared he threw himself unreservedly into the patriotic works that it required. He was one of the signers of the document of Catholic loyalty and patriotism sent to Pres. Wilson on April 19, 1917. During World War II, Archbishop Glennon constantly urged civilian defense, as a task for each man "joining with his neighbour to save his community." He stressed defense of U.S. rights and liberties, not only against threats from abroad but against abuse in the U.S.

Nominated to the Sacred College of Cardinals, according to an announcement of Dec. 23, 1945, he was created and proclaimed a cardinal at the consistory of Feb. 18, 1946. On his return from Rome he paid a visit to his native Ireland, where he was stricken and died on March 9, 1946, at Dublin, Eire.

Gliding

Gliding and soaring came of age during the decade 1937-46. Several of the European countries, notably Germany, Poland and Sweden, required experience in motor-

Evacuation of U.S. casualties from the Rhine front in the spring of 1945 was speeded by ambulance gliders fitted with triple tier bunks

less aircraft as a prerequisite to power plane flying or as parallel training. Japan and the U.S.S.R. introduced large-scale glider pilot training programs for their youth. Gliding clubs were formed in many countries throughout the world, including England, France, Germany, Poland, Sweden, Switzerland and the United States. Gliding and soaring contests became important national and international events. Soaring was to have been a part of the 1940 Olympic games scheduled to be held in Finland; in anticipation of this event, an international committee met in 1938 and 1939 and selected a German designed glider, the DFS Meise, as the official Olympic sailplane.

At the onset of war in Europe in Sept. 1939, the major glider records for both singleplace and multiplace gliders were as follows: distance—465 mi., established July 6, 1939, by O. Klepikova in the U.S.S.R.; altitude—22.434 ft. reached by E. Ziller in Germany; and duration—50 hr. and 26 min. attained by A. Bodecker and Z. Zander in Germany.

During World War II, gliding and soaring ceased as a sport completely in England, France and Poland, but continued in Sweden, Switzerland and the United States. In contrast, however, Germany encouraged gliding and soaring, and a new world duration record of 53 hr. and 52 min. was established by E. Jachtman on Sept. 23–24, 1944.

In 1941, gliders emerged as a military weapon with the invasion by Germany of Belgium and Crete by glider borne troops. With feverish activity, both England and the United States designed and built huge gliders. The U.S. army glider, CG-10, designed and built by Laister Kauffmann Aircraft corporation, was representative of the larger ones. The wing span was 105 ft. and it was capable of carrying 42 fully equipped soldiers. Military gliders were used by the United Nations in the invasion of Sicily, Burma, Normandy, Southern France and the Netherlands. In Germany, gliders were used not only for troop carriers but also as a means of investigating and testing aerodynamic problems. They were utilized in the developing of reaction-propelled military aircraft.

During this period, the Soaring Society of America was the only active glider organization outside Germany. A new national altitude record of 19,434 ft. was established July 18, 1943, by J. Shelly Charles. Pilot regulations were changed by the Civil Aeronautics administration, permitting glider flights to be credited toward a power plane

licence. Two technical conferences were conducted in 1944 and 1945 at the Polytechnic Institute of Brooklyn. "C," Silver "C" and Golden "C" awards were issued.

With the end of the war in Europe in 1945, the French resumed their gliding and soaring activities and during that summer and fall established two new French national records: distance to a fixed destination—229.9 mi.; distance with return—124.3 mi.

In England, gliding clubs resumed their flying activities, and the British Gliding association was reactivated March

Shaven "Apaches" of the U.S. 194th glider infantry regiment at a briefing prior to the airborne invasion of Germany in March 1945. Not a single aircraft transporting troops was lost in the operation

1, 1946. There was general agreement among the British gliding pilots that a national contest in 1946 was not advisable, and that British gliding activities should concentrate in 1946 on technical and research problems.

In Australia the Sydney Soaring club started operations and during Dec. 1945 reported soaring flights ranging from 50 to 200 mi. and altitudes from 4,000 to 11,600 ft. In Argentina, a new national distance record of 262.5 mi. was established on Jan. 6, 1946.

In the United States, the government weather bureau employed gliders in its 1946 research program investigating thunderstorms. The United States by this action became the only other country beside Germany to recognize the contributions of gliding and soaring to science. The Soaring Society of America organized the first postwar national contest, Aug. 3 to 18, 1946. At this contest poor weather prevailed which before 1937 would have meant virtually no flights. The distances flown ranged up to 187 mi., and altitudes were reached up to 14,400 ft. A new national distance-and-return record of 100 mi. was established. (See also AVIATION, MILITARY.)

Goebbels, Josef

Goebbels (1897-1945), German propagandist, was born Oct. 29, 1897, at Rheydt in the Rhineland. Goebbels, a cripple from birth, was educated at Heidelberg university and was an early convert to national socialism (1922), becoming district leader (Gauletter) of the party for Berlin in 1926. He founded the nazi party paper, Der Angriff (The Attack) in 1927. After Hitler's advent to power in 1933, Goebbels received the newly-created post of reich minister of propaganda and public enlightenment. He was phenomenally successful in indoctrinating the entire nation with Hitler's ideas. The German press, radio and every other possible outlet for public information were under his strict control. After the period of great German victories in World War II had ended, Goebbels employed the channels of public information to prop sagging German morale.

Goebbels was believed to have remained in the reich chancellery with Hitler during the paroxysmic "last stand" in Berlin in the spring of 1945. A soviet communique of May 3, 1945, quoting a deposition by Hans Fritsche, an assistant of Goebbels who was captured by the soviets, said that Goebbels had committed suicide.

Goering, Hermann Wilhelm

Goering (1893–1946), German reichsmarshal and political leader, was born at Rosenheim, Bavaria, on Jan. 12, 1893. During World War I he commanded the famed Richthofen squadron in the German air force after Richthofen's death. He was an early member of the nazi party and became air minister and minister of the interior in 1933 upon Hitler's accession to the chancellorship.

In Jan. 1940 Goering was appointed head of the eco-

nomic general staff, and in July Hitler conferred upon him the newly created title of marshal of the reich. In July 1944 he was also named mobilization director. Responsible for the building up of the air force, in control of Germany's economic life and manpower, designated first choice as successor to Hitler and personally one of the world's greatest industrialists and richest men, Goering was generally regarded as second man in Germany during World War II. Immediately before the German defeat, however, he was accused by Hitler of "disloyalty" and removed from all his posts.

Goering surrendered to the U.S. 7th army on May 9, 1945. Three days later he was indicted as a war criminal by the United Nations War Crimes commission; it was charged that he was one of the chief instigators of the nazi plan to build a greater Germany by ruthless aggression, and that he was implicated in the mass murders of Jews and foreign slave labourers. Goering remained an adamant nazi throughout the trial. Convicted and sentenced to death, he cheated the gallows by swallowing a vial of potassium cyanide in his cell at Nuernberg prison on Oct. 15, 1946, two hours before his scheduled hanging.

Gold

The decade 1937-46 witnessed sweeping changes in the role played by gold in the foreign exchanges, in its production and in its international movements.

Most of the leading commercial nations of the world had been compelled, under the impact of the depression of 1929-32, to abandon the rigid gold standard to which they had returned in the 1920s. In April 1932, however, Great Britain adopted a "flexible" gold standard, the central feature of which was an equalization fund, designed to stabilize the pound sterling and at the same time insulate the British economy against the monetary effects of exports and imports of gold. The United States adopted a variation of the British technique in 1934 after devaluating the dollar, and by the end of 1936 France, Belgium, Switzerland and the Netherlands had turned to this managed type of gold standard, with the axis nations electing to cling to the techniques of exchange controls and barter agreements. With the coming of World War II in 1939, however, the Tripartite agreement on which this newest experiment with the gold standard rested was declared inoperative for the dura-

Catherine the Great was once asked what she regarded as the most important three requirements for making war. She replied: "Gold, more gold and still more gold." The decade 1937-46, however, emphasized that modern war was too big to be financed by a "war chest," however large. Modern war was a war of mobilization and production, in which gold played a comparatively minor role and in which the mining of that metal was found to be a luxury in the light of wartime manpower shortages and of the greater strategic importance of other metals, such as copper, lead and zinc. There was no mystery, therefore, in the fact that gold production in those countries reporting figures monthly showed a decline from \$1,297,000,000 in 1940 to \$645,000,000 in 1945, or slightly more than 40%.

The most spectacular feature of the decade with respect to gold, however, was its wholesale migration to the United States from nearly every corner of the world, a movement which was interrupted only during the two years, 1944-45. That interruption was caused by the operation of lend-

lease, under which the United States treated most of its imports as ordinary exchange transactions and the bulk of its exports as contributions to the war effort. This created an anomalous situation in which, although physically the United States had the largest export balance in its history, its balance in terms of foreign exchange was actually negative. The unprecedented flow of gold to the United States began as early as 1934 following the reduction in the official valuation of the dollar in terms of gold to 59% of its former level, a figure at which, it was generally agreed, it was undervalued. By the beginning of 1937 this movement had already reached a total of \$3,990,000,000, but that was only a beginning.

Gold fled to the United States for a variety of reasons between 1934 and 1943. It moved there in payment for war materials by Japan, and later, by the British government, because European nationals were fearful for the safety of their possessions during the years when the war clouds were gathering over the continent, and because European governments, in the months when Adolf Hitler was carrying everything before him, were frantically seeking to place their gold reserves beyond the conqueror's grasp. The tide reached its crest in 1940, when imports of the metal by the United States reached \$4,745,000,000, a figure roughly equivalent to the nation's entire gold stock before the devaluation of the dollar. Before the movement spent itself, it had added \$18,700,000,000

Table I.—World Movement of Gold, 1937-46 (As shown in U.S. statistics) (000,000s omitted)

(E. H. Co.)

Production.—The totals for world production of gold could only be approximated during the decade 1937–46, because of the lack of data from the U.S.S.R. and Japan. Productions are shown in Table II for all countries with known outputs amounting to more than 250,000 oz. a year. The 15 countries listed accounted for more than three-quarters of the total output, while the unknown soviet and Japanese outputs made up about the same proportion of the remainder. Although gold production was regularly reported from 70 other sources, the outputs were small, both individually and in the aggregate.

Gold production was one of the few mineral industries which did not suffer a sharp decline during the depression years of the 1930s and so went into the period of World War II with a long record of increasing output, extending from the slump following World War I. The former record high of 1915 was surpassed in 1932, and in each successive year from then until a new world record was established in 1940. Although the decline in world output was moderate in 1941, it became so pronounced in the succeeding years that by 1945 the decline from the 1940 high amounted to 46%. Few countries escaped participation in the decline, for one reason or another. Areas in volved in active fighting naturally suffered the worst, but

few countries in the fighting zones were producers of importance. In other areas shortage of manpower, equipment and supplies were the major factors aftecting output. In some cases, as in the United States and Canada, production of gold was purposely restricted, in order that labour and materials might be diverted to the production of the base metals required in the war program. Even where there was no official restriction of gold output, labour drifted to other work where war demand had increased wages; worn-out equipment could not be replaced; and

needed supplies were diverted to more essential uses. Small producers in remote areas, where production methods were still more or less primitive, suffered relatively less than those whose operations had been more highly mechanized.

On the whole, war conditions put gold output back to somewhat less than the 1932 production, but there was considerable difference in the degree to which various producing countries were affected. As compared with the decline of 46% in world production from the peak year to 1945, operations in Korea and the Philippines were practically entirely stopped, as both were in fighting areas; in the United States, production dropped 81%, in Australia 61%, Chile 52%, Canada 50% and Mexico 49%, while the Gold Coast met the world average of 46%. India showed a decline of 49% after 1937, an acceleration of a trend which had been under way since World War I. Among those countries which were able to maintain opera-

Crated gold bullion arrived in great quantities at New York city from Europe in Aug. 1939, shortly before the outbreak of World

tions at a rate better than the world average, Peru declined 37%, Brazil 33%, Belgian Congo 32%, Southern Rhodesia 31% and Colombia 23%. The best record of all was made by South Africa, with a drop of only 15%; this small decline for the largest producer, which accounted for more than a third of the total output of the decade, was the largest factor in preventing a world decline of even greater proportions.

United States.—Gold production in the United States reached a peak in 1940 and suffered only a minor break in 1941, even though labour was being lost to defense industries. The real impact of the war on the industry was not lelt until 1942. Early in that year, gold mines were excluded from priority benefits. Losses of manpower became more pronounced and on Oct. 8, 1942, limitation order L-208 became effective; the mining of gold was banned except insofar as it accompanied the base metals needed for the war program. Lode mines producing less than 100 tons of ore monthly, or placer mines handling less than 100 cu.yd. of material monthly were also exempt

from the order. Enforcement of the order resulted in a 25% drop in 1942, followed by others of 61% in 1943, 26% in 1944 and 9% in 1945, all of which combined to give a decline of 81% from 1940. The purpose of the limitation was to free labour and equipment for the more vitally needed base metals. It was argued on the one hand that with gold demonetized, it was useless in financing the war program, and hence it was a waste of manpower to dig gold out of one hole in the ground, only to bury it in another. On the other hand, it was contended with equal vigour that the government continued to support gold mining in other countries by buying their output, and that the order singled out for drastic action only one of a large group of industries which could be regarded as equally nonessential. The order did result in hardship and losses in the industry; that it had been at least in some degree unjustified was recognized in 1946, when measures were taken to recompense the mines for financial losses.

The restriction order was rescinded, effective July 1, 1945, but recovery in output was delayed for several months while the mines were being put back into working condition, equipment was being rehabilitated or replaced, and the necessary labour force was being recruited. There was only a minor increase in output in the second half of 1945-55% of the year's total, against 45% in the first half. While the June 1945 output of 67,995 oz. had increased to 98,328 oz. in November, there was a recession of output to a low of 84,226 oz. in Feb. 1946, and it was not until May that the November rate was exceeded. The beginning of real improvement in output came with 113,-373 oz. in May 1946, advancing to 177,240 oz. in September, but declining to 152,956 oz. in October. The total for the 10 months—1,216,289 oz.—was at an annual rate of 1,460,000 oz.

Canada.—Gold production in Canada followed much the same pattern as in the United States, but to a lesser degree; output decreased only 50% from the high of 1941. There was some governmental limitation of activity, but nothing so drastic as in the United States, and official limitations probably led to not much if any more reduction than the natural causes—shortage of labour and rising costs. Improvement in output started at midyear of 1945, but was slower than in the United States; production in 1946 was 3,214,377 oz., 19% more than that of 1945.

South Africa.—Gold mining continued to fill such a large place in the general economy of South Africa that operations were maintained as well as existing conditions would permit. Even so, production suffered a decline of 15% from 1941 to 1945, largely because of shortages of labour and supplies and rising costs.

Golf

Golf, growing in U.S. popularity until it was pressing hard on the heels of baseball and football in the race for public favour, sustained a body blow when the United States entered World War II in 1941, calling a halt that lasted four years. No other major sport was hit so hard, what with gasoline rationing, restrictions in the use of rubber and steel for manufacturing balls and clubs and manpower shortages.

In the period from 1937 until Pearl Harbor the game was just beginning to regain the momentum it lost through the retirement of Bobby Jones from the golfing scene. Then came the war and the stoppage of all major championships save one for four years. But in 1946, with most if not all of the stars mustered out of service, the game rebounded to such an extent that the season deserved to be rated the greatest in history to that date.

Prior to Pearl Harbor.—The year 1937 saw brawny Ralph Guldahl, a Texan, set a new record of 281 in winning the U.S. open championship over the Oakland Hills course in Detroit, Mich., eclipsing the 282 mark made by Tony Manero at Baltusrol (N.J.) in 1936, and the American Ryder cup pro team registered its first triumph on British soil. The year also saw Johnny Goodman of Omaha, Neb., win the U.S. amateur at Portland, Ore., the first time the event had been staged in the Pacific northwest. Goodman thus became the fifth golfer to win both the amateur and open titles, others being Bobby Jones, Chick Evans, Francis Ouimet and Jerry Travers. Goodman beat Ray Billows of Poughkeepsie, N.Y., in the final. The U.S. women's crown went to Mrs. Estelle Lawson Page of Chapel Hill, N.C. Byron Nelson won the masters tourney at Augusta, Ga., by picking up 6 strokes on Guldahl in 2 holes, playing the par 3 No. 12 and the par 5 No. 13 in 2-3 as against Guldahl's 5-6. Nelson also annexed the \$12,000 Belmont, Mass., open, richest U.S. pro tourney up to that time. Honours in the pros' championship (the Professional Golfers' association) in 1937 went to Denny Shute, who defeated Harold (Jug) Mc-Spaden on the 37th green of the Pittsburgh Field club.

Bob Sweeny, U.S.-born Londoner, won the 1937 British amateur, while Henry Cotton gained top honours in the open for the second time. Jessie Anderson, daughter of a pro, attained the British women's title by defeating Doris Park, also a pro's daughter, in the first all-Scottish final in the history of the championship. Although a victory in the Canadian open was his only national success in a decade of brilliant golf, Harry Cooper won the Vardon trophy in 1937, emblematic of the year's superiority among the pros by maintaining an average of less than 72 strokes per round in 25 tournaments.

The chief legislative act of 1937 was the adoption of a rule by the U.S. Golf association limiting the number of clubs a player could carry in his bag to 14; the edict went into effect on Jan. 1, 1938.

Perhaps the most notable occurrence in golf in 1938 was the defeat sustained by the U.S. amateurs in the Walker cup match at St. Andrews, Scotland, marking the first British success in that event. The U.S. women's team, however, turned in a victory over the British in the Curtis cup match.

Guldahl repeated in the U.S. open and also won the

Western open for the third year in succession. Willie Furnesa, whose six brothers were well-known pros in the Metropolitan (N.Y.) district, emerged with the U.S. amateur crown by defeating B. Patrick Abbott of Hollywood, Calif., a former public links champion, 8 and 7, at the Oakmont Country club, Pittsburgh, while Patty Berg, 20-year-old University of Minnesota student, turned the tables on Mrs. Page in the finals of the U.S. women's championship at the Westmoreland club, Wilmette, Ill., the margin being 6 and 5.

In Great Britain Reginald Whitcombe, member of a distinguished golfing family, won the 1938 British open; Mrs. Andrew Holm gamed her second victory in the women's (she won in 1934 also); while Charley Yates of Atlanta, Ga., a protégé of Jones, captured the British amateur, fifth U.S. representative to accomplish the feat (others were Walter Travis, 1904; Jess Sweetser, 1926; Jones, 1930; and Lawson Little, 1934–35).

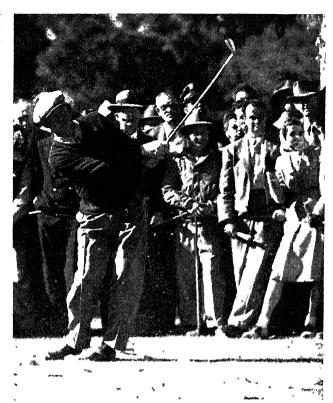

The year 1938 also marked the advent of Sammy Snead, destined to become one of the greatest professionals in the game's history. Although he failed to win any major honours during that year, Snead's prodigious drives and his phenomenal scoring gained him the "golfer of the year" crown when he earned approximately \$20,000 in prize money-an all-time record-on the pro circuit. His best showing came in the P.G.A. championship at Shawnee on Delaware, Pa., where he reached the finals, only to be overwhelmed by Paul Runyan by 8 and 7, the most onesided margin in the history of the tournament. Outdriven by tremendous margins, often to the extent that he had to use brassies and spoons for his second shots whereas Snead was able to get home with medium, even short, irons, Runyan gave one of the greatest exhibitions of wooden club play ever witnessed.

Henry Picard won the 1938 masters at Augusta, Ga., with a score of 285.

The outstanding figure in golf during 1939 was Marvin (Bud) Ward of Spokane, Wash., who, in addition to capturing the U.S. amateur, came within a stroke of tying in the open. In the amateur played at the North Shore club, Chicago, Ward beat Ray Billows who, for the second time in g years had to be content with runner-up honours as he lost, 7 and 5. In the 1939 open at the Philadelphia Country club, West Conshohocken, Pa., he finished only a stroke out of a tie despite his 55 on two of the par 3 holes in the final round. That was the championship in which Snead, with victory almost in his grasp, finished with an 8 on the par 5 home hole—an easy one for him—when a par would have given him the crown by one stroke. As it was the event ended with Nelson, C. Wood and Denny Shute deadlocked for the lead with scores of 284. Nelson won after a double play-off.

An attack of appendicitis prevented Miss Berg from defending her laurels in the U.S. women's of 1939, and honours in that event went to Betty Jameson, sturdy Texan from San Antonio. In the field at the Wee Burn club, Noroton, Conn., was Pam Barton, holder of the British women's title who had gained the U.S. championship at the Canoe Brook club, Summit, N.J., in 1936. Charlotte Glutting, one of the New Jersey stars, climinated the British star after an extra-hole match in the quarterfinal round. The event was given additional international flavour by the presence of Jean Crocker, South American champion, but she, too, lost in an extra-hole match; Betty Hicks, 18-year-old Californian, destined to win the title two years later, beating her. In the final, Miss Jameson defeated Dorothy Kirby of Atlanta, 3 and 2.

Henry Picard sank a seven-foot putt on the first green

Byron Nelson shooting from the edge of the eighth fairway at the open tournament in Los Angeles, Calif., during Jan. 1946. Nelson won the tournament with a total of 284 strokes

at the Pomonok club, Flushing, L.I., to beat Nelson in the extra-hole final of the P.G.A. in 1939, and Guldahl accounted for the masters with a total of 279, low score for the tourney, to Snead's 280.

In Europe, where the clouds of war were gathering, Alex Kyle won the British amateur, while a comparative unknown, Richard (Dick) Burton, captured the 1939 open crown, his 71 on his final round giving him a one-stroke edge on Johnny Bulla, U.S. invader who had finished the test on the St. Andrews course with a total of 282.

The Ryder cup match, scheduled for Ponte Vedra, Fla., late in 1939, had to be cancelled because of the war situation; the British P.G.A. was unable to send a team to compete.

With war at hand and Britain fighting for its very life in 1940, two other international competitions listed for that year, the Walker cup and Curtis cup matches, had to be abandoned, along with the three British championships. The United States had not yet been drawn into the conflict, so golf went on as usual in 1940, with Little winning the U.S. open, Richard (Dick) Chapman the U.S. amateur, and Miss Jameson repeating her 1939 triumph in the women's. Little, who had turned pro after winning both the U.S. and British amateurs in 1934 and 1935, gained his first victory as a member of the "play-for-pay" brigade by beating Gene Sarazen in a play-off after the latter's belated rush had gained him a tie with a score of 287. In the play-off Little beat Sarazen, who had been the open champion 18 years before, 70 to 73. Chapman's victory came at the Winged Foot club, Mamaroneck, N.Y., where he beat W. B. (Duff) McCullough, "week-end, business man" golfer from Philadelphia, 11 to 9, in the final. Miss Jameson's victim was Jane Cothran, South Carolina girl, the margin being 6 and 5.

Ben Hogan (right) receiving the Goodall Round Robin golf tournament trophy at Mamaroneck, N.Y., in June 1946

The P.G.A. crown went to Nelson in 1940 as a result of his one up margin over Snead at the Hershey club in Pennsylvania. The 1940 masters went to Jimmy Demaret, another product of Texas. One of the greatest scoring performances in history took place during 1940 when Wood won the Metropolitan (N.Y.) open with a score of 264 on the par 70 Forest Hill Field club course in New Jersey.

Perturbed by the amount of "backspin" the touring pros were getting, the U.S.G.A. adopted new specifications concerning the "scoring" of club faces, the new rules to become operative on Jan. 1, 1942.

Wood, persistent runner-up in major golf events, managed to shake his hoodoo in 1941 when he added the U.S. open crown to one he had gained earlier, the masters. Ward regained the amateur title he had previously won in 1939 by beating "Pat" Abbott in the 1941 final, the match being marked by considerable bad feeling and played before an ill-behaved gallery at the Omaha Field club. Mrs. Frank Newell, the former Miss Hicks who had figured so prominently in the championship at Wee Burn two years before, gained the 1941 U.S. women's title by defeating Helen Sigel of Philadelphia in the final at the Country club of Brookline, near Boston. Vic Ghezzi captured the 1941 P.G.A. championship after a 38-hole match with Nelson at Denver. Wood's triumph in the masters made up for his misfortunes in the first two that were held. In 1934 he had the tournament practically won, only to have Horton Smith come along and drop a 20-ft. putt on the next to last green and eke out a one-stroke victory. Then, in 1935, Sarazen, 3 strokes behind, playing the No. 15 hole in the last round, had holed out a 220-yd. spoon shot for a double-eagle 2, enabling him to finish in a tie with the Winged Foot pro, whom he then beat in a play-

A total of 2,816 players entered the 1941 U.S. public links championship, a record entry for any event up to

that time. Another record was set when purses amounting to more than \$200,000 were put up as prize money for the pros. Five new names were voted during the year into the hall of fame that had been created with Jones, Francis Ouimet and Sarazen as the first recipients of that honour. The names added were those of Evans, Travers, J. J. McDermott, Alex Smith and Willie Anderson.

War and Eclipse.-Champions crowned in 1941 were destined to hold their laurels for several years when golf, or at least championship golf, was halted by the Japanese attack on Pearl Harbor on Dec. 7 that year. It was only a few weeks afterward, at its annual meeting in 1942. that the U.S.G.A. called off all its championships with many other golf bodies following suit. The only major tournament held in 1942 was the P.G.A. championship, which Snead won by defeating Corp. Jimmy Turnesa, on leave from Fort Dix, N.J., after the latter had scored triumphs over Ben Hogan and Nelson in successive rounds. The only other competitions of note were the Hale America, a charity event that was a sort of unofficial U.S. open, at Chicago; the masters and the All-American. Golf's "Mighty Atom" Hogan, captured the Hale America with a score of 271, lowest total ever scored in a competition of such magnitude. Nelson won the masters for the second time (his other win was in 1937), by picking up 8 strokes on Hogan on the last 36 to gain a tie and win on the play-off. Here again he had to wage an uphill battle. Hogan had a 3-stroke lead for the first 5 holes, but Nelson made up the deficit on the next 11 despite the fact that "Beltin' Ben" travelled at a one-under-par clip over that distance. Nelson also repeated in the 1942 All-American. beating Clayton Heafner in a play-off after both had posted 280 totals. Hogan, however, gained the Vardon trophy for the third successive year in 1942 and also topped the pros in prize-winnings, his "take" being \$13,143.

Golf was cramped more than ever in 1943, with even the P.G.A. abandoned. The pros, though their ranks were greatly thinned, continued their touring activities, tying them in with the war effort by bond-selling endeavours, and later staging successful campaigns to raise funds to provide golfing facilities at veterans' hospitals throughout the country. The only event of consequence played in 1943 was the All-American at Tam O'Shanter, where Harold (Jug) McSpaden won by defeating William (Buck) White, Mississippi pro, in a play-off after a tie at 282.

As only one example of what golf did to justify itself during wartime, the Chicago District Golf association, sponsor of the Victory cup tournament, raised \$137,639.37 over a five-year period and turned it over to such war charities as the United Service Organizations, Red Cross and Army and Navy Relief.

Professional golf went on a "spree" in 1944, the P.G.A. not only reviving its championship, abandoned the year before, but arranging the biggest schedule from the standpoint of prize money in its entire history. Chief beneficiary was Nelson, whose winnings of \$46,766 in war bonds more than doubled the record of \$19,554 made by Snead in 1938. To Nelson went the added honour of being named the year's outstanding sports figure in the Associated Press's annual poll.

While most of the top-notch pros were in service—Snead, Hogan, Demaret, White, Victor Ghezzi, Lloyd Mangrum, Jimmy Thomson, Little, E. J. (Dutch) Harrison, Heafner, to mention only a few—Nelson and McSpaden, exempted on grounds of physical disability, had a harvest. Between them they won 12 of the 22 tournaments that were staged, Nelson accounting for 7 and McSpaden 4. They also teamed together to win a 4-ball event at Minne-

apolis, setting up a record by playing 7 rounds in 64 under par. Nelson's only major failure came in the P.G.A. championship in which he lost, one down, to Bob Hamilton, obscure Indiana pro whose only claim to fame was the winning of the North and South open at Pinehurst, N.G. The triumph that put Nelson on the way to his money-winning record was his victory in the All-American open, where first money was \$13,462.50 in war bonds or the equivalent of \$10,100, largest single cash prize ever offered.

There were no amateur tournaments of note in 1944, but Dorothy Germain, 20-year-old Philadelphian, won the women's western amateur title for the second year in succession and Lieut. Patty Berg and Mrs. Mildred (Babe Didrikson) Zaharias did well in professional competitions for women.

In 1945 the story of golf again was chiefly that of one man and one organization, the man, Nelson, the organization, the P.G.A. Competing in 31 of the 40-odd tournaments staged by the P.G.A., Nelson finished first in 19 of them. By the end of the year his prize-winnings had reached the total of \$60,600 in war bonds, breaking all previous marks.

His chief triumph came in the P.G.A. championship, which he won for his second time by beating Sam Byrd, one-time Yankee outfielder, 4 and 3, at the Morain Country club, Dayton, O. In addition he annexed the Canadian open, revived after a two-year blackout, with a score of 280, and also annexed the All-American open at Tam O'Shanter for the fourth time in its 5-year history with a score of 269, 19 under par. His all-time earnings in this tournament alone amounted to \$26,975 in actual cash, top money in 1945 being \$14,200 in war bonds.

In the course of the greatest winning streak ever attained by any player, Nelson won 11 straight tournaments before he was finally checked by Fred Haas, Jr., New Orleans amateur, at Memphis, Tenn. Subsequently two other amateurs, Lt. Cary Middlecoff and Frank Stranahan bested the pros in the Pinehurst's centennial event and in the Durham, N.C., open.

Nelson also established a new P.G.A. scoring record in the Scattle, Wash., open with a score of 259, his rounds being 62, 68, 69, 66, 21 under par, for a new world's record for a par 70 course.

Shortly before, Hogan, returning to competition after three years in the air force, won the Portland, Ore., open with a total of 261, his rounds being 65, 69, 63, 64. In a way this was a greater performance than that of Nelson's for it was accomplished on a par 72 course. Nelson's average for the year was 68.33, almost a stroke below the mark he set in 1944. Once again in 1945, Nelson was voted the No. 1 athlete in the Associated Press poll. This was the second year in succession he had received that honour, the second time any athlete had received that distinction. Only one other golfer had ever been named, Sarazen being chosen in 1932.

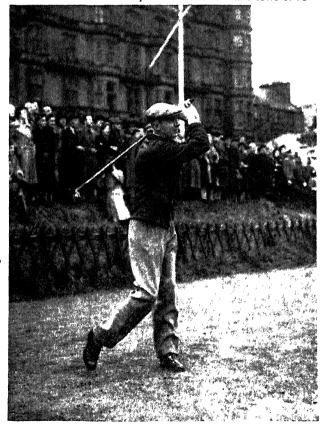

With the war over and golfers returned from far-flung battle fronts, it was almost inevitable that the game should enjoy one of its greatest years in 1946, when all the championships were resumed, after a five-year lapse for most of them. Enthusiasm for the game reached new heights, as shown by the turnouts for the P.G.A. sponsored events and particularly for the U.S. open, first of the U.S.G.A. championships to be played. New attendance records were set at the Canterbury club, Cleveland, where the open was played and where Mangrum, recently mustered-out G.I. with two Purple Hearts to his credit, won after beating Nelson and Ghezzi in a double play-off. With 12,000

on hand for the final day's play, almost double the previous high of 6,859 who watched Bobby Jones round out the third championship of his "Grand Slam" in 1930, the trio wound up in a tie as each turned in a total of 284 for the 72-hole journey, and with 6 or 8 others hard on their heels in the greatest championship finish in history. The three-day total attendance for the event was 27,200, and the gate receipts over that period were more than \$60,000. The best previous marks up to then were 16,365 and \$46,765, the figures at Interlachen (Minneapolis) in 1930.

After one more round the deadlock still was unbroken, all 3 having scored 72s, but another 72 on the second extra round gave Mangrum the title, Nelson and Ghezzi registering 73s. Two "breaks" decided the championship, one coming in the third round when Nelson's caddy accidentally stepped on his ball, costing him a one-stroke penalty; the other being Mangrum's holing of a 70-ft. putt in the final play-off round. Except for that he doubtless would have come in a poor third.

Although attendance at the National amateur at the Baltusrol club in New Jersey later in 1946 was on the slim side, the championship itself turned out to be one of the best, with more first-class golfers on hand than ever before. Remoteness of the club and an unfortunate decision by the U.S.G.A. in drawing the names for the match play accounted for the poor attendance. Many of the topnotchers, including the three favourites—Ward, holdover champion, Stranahan and Capt. Middlecoff—were elim-

Roger Wethered, elected captain of the Royal and Ancient Golf club in 1939 is shown "driving himself into office" in the traditional play from the first tee at St. Andrews, Scotland, in Sept. 1946, after a 7-year delay in "taking office." The play for the Autumn medal was won by Dr. J. C. Lawrie with a score of 78

Patty Berg teeing off during the women's competition at the Tam O'Shanter country club, Chicago, Ill., in July 1943. Miss Berg won the women's event with a score of 307 for 72 holes, over runner-up Betty Hicks (left), then a SPAR

inated early, Ward beating Stranahan in the second round and then being himself eliminated by "Babe" Lind of Denver in the next. Soon thereafter it was Middlecoff's turn to go out and so, by the time the semifinal was reached, the only name player left was Smiley Quick, exnavy serviceman from California, who had previously won the U.S. public links crown, and been runner-up in the Western and Trans-Mississippi amateurs.

The winner was Ted Bishop, elongated New Englander who at one time in his career had been a pro. He beat Quick after a 37-hole match that ended when the Californian missed a 2-ft. putt for a half on the extra hole. In the qualifying test Skee Riegel, an ex-flying instructor from Glendale, Calif., set a new record with a score of 136, clipping 3 strokes off the mark set by Tommy Sheehan at the North Shore club, Chicago, in 1939.

Mrs. Zaharias won the 1946 women's title at Tulsa by overwhelming Mrs. Clara Callender Sherman of California, 11 and 9, in the final. Mrs. Zaharias thus became the outstanding woman golfer of the year as a result of her other triumphs in the All-American and in the women's Trans-Mississippi, with Louise Suggs of Lithia Springs, Ga., a close second.

Hogan was the man of the year among the pros in 1946. Not only did he win the P.G.A. crown, but he also was the year's leading money-winner, his earnings (up to Dec. 9) being \$42,596. In the course of that time he accounted for 13 of the P.G.A.-sponsored tournaments.

The year 1946 was the most successful in the history of the P.G.A., with 45 tournaments on its schedule and prize money an all-time high, \$484,000. The Tam O'Shanter event led with \$45,000; Herman Barron, Metropolitan (N.Y.) pro won that event, collecting \$10,500 in prizes.

Sam Snead won the British open of 1946. Stranahan played in the British amateur and managed to go several rounds before he was eliminated, the title eventually going to James Bruen. The British women's went to a home player, Jean Hetherington.

Evidence of what was to come appeared in the masters tournament at Augusta when an unknown, Herman Keiser, turned up the winner, and in the U.S. public links championship, where the entry list showed 3.585 names, largest ever to sign up for a major golf championship.

Golikov, Filip Ivanovich

), soviet army officer, joined the Golikov (1900-Red army in 1918. He studied at the Frunze Military academy, was rapidly promoted and later was made deputy chief of the general staff. Regarded as a tank expert, he was decorated for his work in the Russo-Finnish campaign of 1939-40 which had provided him with an opportunity to test his theories on mechanized warfare. In July 1941 he left the soviet union to head a military mission to Great Britain. Following these conferences, he visited the U.S. to discuss lend-lease arrangements. At the end of 1941 he returned to the field of operations to lead one of the seven armies which turned back the nazi tide during the battle of Moscow in the winter of 1941-42. In 1943 Stalin promoted Golikov from army commander to commander of the Voronezh front in the Ukraine. He was responsible for the spectacular, although temporary, recapture of Kursk, Rostov and Kharkov in Feb. 1943.

Appointed director for the repatriation of soviet prisoners in the autumn of 1944, he accused the Allies of mistreating soviet prisoners who, attired in German uniforms, had been captured on the western front and confined in Allied concentration camps. He also charged that the Allies were preventing the repatriation of soviets in the U.S. and British zones of Germany.

Gort, John Standish S.P.V.

Viscount Gort (1886–1946), British army officer, was born in July, the son of the 5th viscount, and succeeded to the title in 1902. Educated at Harrow and Sandhurst, he joined the grenadier guards as a second lieutenant in 1905. In France at the start of World War I, he was wounded four times and received the Victoria cross.

After the close of World War I, he was assigned to teaching posts in the army staff college and the senior officers' school. Between 1932 and 1936, he served in India as director of military training.

On Dec. 2, 1937, he was named chief of the British imperial general staff.

On Sept. 3, 1939, Viscount Gort returned to France as commander in chief of the British expeditionary forces. The surrender of the Netherlands armies in May 1940, and the rapid retreat of the Belgians placed the British and French in an impossible position. Gort retreated to the Dunkirk region; after establishing bridgeheads protecting the withdrawal area, he succeeded in evacuating nearly 225,000 British and 112,000 French soldiers to England.

On July 19, 1940, Viscount Gort was named inspectorgeneral to the forces of the army's training service and in May 1941, he was made governor of Gibraltar. He was transferred in 1942 to Malta as commander in chief, and on Oct. 31, 1944, he became high commissioner and commander in chief for Palestine and Trans-Jordan. He resigned from that post on Nov. 2, 1945, and was made field marshal on Jan. 1, 1943. He died in London, March 31, 1946.

Gouin, Félix

Gouin (1884—), French statesman, was born Oct. 4, 1884, in Peypin, Bouches-du-Rhône department, France. After studying law in Aix, he was admitted to the bar in 1907. Following World War I, during which he served as a private in the army, Gouin was elected in 1924 to the chamber of deputies on the Socialist ticket and was reelected in 1928, 1932 and 1936. After the collapse of France in 1940, he stood with the 80 members of parliament headed by Edouard Herriot and Jules Jeanneney who refused to accord Marshal Pétain the dictatorial powers he had asked for. He was one of Léon Blum's lawyers at the Riom trials.

Félix Gouin, elected president of the provisional government of France on Jan. 23, 1946, is shown announcing the composition of his newly formed coalition cabinet to members of the press

In Aug. 1942, Gouin fled to England, joined Gen. de Gaulle and held a number of important posts in the Free French movement.

After the liberation of France, he was elected to the provisional assembly in Nov. 1944 and in Oct. 1945, he was elected president of the assembly, obtaining 512 out of 543 votes. Although a right-wing Socialist, he was acceptable to the Communists as a compromise candidate during the crisis caused by De Gaulle's resignation as president of the provisional government, Jan. 22, 1946, and the assembly elected him as the general's successor by a 407 to 55 vote.

Gouin's task of harmonizing the frequently disparate policies of the three major parties represented in the government—Mouvement Républicain Populaire (M.R.P.), Socialist and Communist—was made doubly difficult by mounting inflationary pressures, food and fuel shortages and insistent labour demands for wage increases to offset the inflationary spiral. On foreign policy, the M.R.P. and Socialists backed the western, the Communists the eastern, powers. All three parties, however, lauded Gouin's insistence on a prolonged Allied occupation of the Reich and internationalization of the Ruhr. After the election of the new constituent assembly, Gouin resigned, June 11, 1946 and was succeeded by Georges Bidault. Gouin was given the post of vice premier in the Bidault government formed June 24, 1946.

Gout

See ARTHRITIS.

Gouveia, Teodosio Clemente de

Cardinal Gouveia (1889—), archbishop of Lourenço Marques, Portuguese East Africa, was born at Sao Jorge, Madeira, on May 13, 1889. He was ordained to the priesthood in 1919, elevated to bishop of the titular see of Leuce in 1936 and named archbishop of Lourenço Marques in 1941. To secure funds for a new cathedral, the archbishop had all the historic plate in the episcopal residence sold.

Upon the occasion of the consecration of the cathedral in 1945, he acted as host to the patriarch of Lisbon and twelve apostolic delegates and presided over the impressive ceremonies.

Proclaimed a cardinal by Pope Pius XII on Feb. 18, 1946, he had the distinction of being the only cardinal from Africa.

Govorov, Leonid N.

Govorov (1896-), soviet army officer, was born in Leningrad and graduated from St. Petersburg Military academy in 1916. He began serving the soviets as an artilleryman in Siberia and the Crimea during the campaigns of 1919-20. During the Russo-Finnish war of 1989-40, he acted as commander of soviet artillery which broke the Finnish Mannerheim line. In 1941 he was promoted to the rank of lieutenant general and in 1942 to that of colonel general. After Germany invaded the U.S.S.R., Govorov was put in command of single operations around Leningrad in the winter of 1941-42; he was given full command of the Leningrad front in Jan. 1943 and led the offensive which finally liberated the city on Jan. 27, 1944. His army then turned southwest, invading part of Estonia, and on June 10 opened a surprise drive into Finland through the Karelian isthmus, a drive which culminated in the Russo-Finnish armistice of Sept. 4, 1944. Turning south again, it then attacked in northern Estonia south of the Gulf of Finland, sweeping across the country in a lightning offensive which resulted in the capture of the capital, Talinn, in less than a week and the conquest of the entire mainland in less than two weeks. Govorov was promoted to the rank of field marshal on June 18, 1944.

Gowrie, Alexander Gore, 1st Baron

Lord Gowrie (1872-), V.C., G.C.M.G., British soldier and imperial administrator, second son of the 8th Lord Ruthven, was born at Windsor on July 6, 1872, and was educated at Eton. Joining the Highland light infantry in 1891, he took part in the Sudanese campaign under Lord Kitchener in 1898, and won the Victoria cross at the age of 27. He served also as a special service officer in the Somali campaign of 1903-04, was military secretary to the viceroy of Ireland in 1905-06 and to the governor general of Australia in 1908. During World War I he fought with the Welsh guards in France and Gallipoli, receiving the D.S.O. in 1916 and a promotion to the rank of brigadier general in 1917. From 1920 to 1924 he was in command of the Welsh guards, and from 1924 to 1928 of the first infantry brigade at Aldershot. In the latter year he was appointed governor general of South Australia and was created K.C.M.G. He was transferred to the governorgeneralship of New South Wales in 1935. Created a baron in Dec. 1935, he assumed the office of governor general of the Australian commonwealth on Jan. 22, 1936. He occupied that position until July 1944, when he was succeeded by the duke of Gloucester.

active in 1940, but it was only after 1941 that output was reported. Because of interruption of imports, several new plants were financed by the government, but by the end of 1943 the foreign supply had improved to such an extent that the government plants were shut down. In the postwar period, there seemed to be no more prospect for the continuation of a domestic industry than there was in 1919, as costs were higher and grades were lower than for imported graphites. Crystalline graphites are used in the manufacture of refractories such as crucibles, retorts, sleeves, stoppers, and nozzles, as well as in lubricants, carbon brushes, and pencils; amorphous carbon is used in foundry facings, lubricants and paint. (G. A. Ro.)

Grau San Martín, Ramón

Grau San Martín (1887—), Cuban statesman, was born Sept. 13, 1887, in Piñar del Río, Cuba, the son of a wealthy tobacco merchant. He studied at the University of Havana, taking his degree of doctor of medicine in 1908, and continued medical studies at several European schools. Grau San Martín, who became titular professor of physiology at the University of Havana in 1921, resigned in 1927 in protest against the Gerardo Machado dictatorship. Two years later he was imprisoned by the police for revolutionary activities.

After Machado was ousted in the revolution led by Col. Fulgencio Batista y Zaldivar in 1933, Grau San Martín became president and held office for four months, resigning in Jan. 1934. As head of a Centrist political group, he announced in 1940 that he would run as opposition candidate to Batista for the presidency. He declared the Centrists were committed to a policy of economic and political co-operation with the United States and denounced the Batista followers as "Reds." He was defeated by Batista in the election of July 1940.

Grau San Martín again became a presidential candidate in 1944, this time successfully; his opponent was Carlos Saladrigas Zayas, a Cuban attorney who had Batista's support but lacked the dynamism and popularity of his mentor. Assuming the presidency on Oct. 10, 1944, Grau San Martín pledged democratic rule. The first two years of his tenure were marked by rumblings of revolutionary plottings against his regime. While his personal popularity remained high, he was attacked by Cuban conservatives.

He was also accused of being too lenient with the Cuban Communists. Grau San Martín, however, maintained that the influence of the Communist party in Cuba was negligible.

In 1945 and 1946, Grau San Martín's government put down two short-lived and seemingly localized revolts by groups of army men joined by anti-Grau civilians.

Graziani, Rodolfo, Marchese di Neghelli

Graziani (1882—), Italian soldier, was born Aug. 11, 1882, at Filettino. He served with the army in Eritrea from 1908–13 and in Libya prior to Italy's entry into World War I. In the campaigns against Austria he commanded an infantry brigade, and by Oct. 1918 he had advanced to the rank of colonel. After the war he was commander of a brigade in Macedonia and during his service in Tripolitania (1921–29) was promoted to general of a division.

In 1935 and 1936 he directed the southern attack against Haile Selassie's forces in Abyssinia. Second in military fame to Marshal Badoglio, he became known as Italy's greatest colonial soldier.

Upon Italy's entry into World War II on June 10, 1940, Graziani was confirmed as chief of the army staff. After the death of Italo Balbo the following month, he was also appointed governor general of Libya. As commander of

Italy's North African forces, he directed the Italian invasion of Egypt which began on Sept. 12, 1940. Although he was temporarily victorious at Sidi Barrani, his troops were soon routed by the British. As a result of this defeat, he resigned, in March 1941, as chief of staff and governor of Libya. After the deposition of Mussolini by Badoglio in July 1943 and the surrender in Sept. to the Allies, Graziani organized and led a new German-Italian force, for which service he received the German Iron cross in Oct. 1944. He was captured by the U.S. 15th army in April 1945 and was indicted for treason by the Italian authorities on the charge of having collaborated with Germany.

Great Britain and Northern Ireland, United Kingdom of

An independent kingdom in northwestern Europe, the United Kingdom comprises the main island of Great Britain, with numerous smaller islands off the English and Scottish coasts and the six northeastern counties of Ireland. It is a constitutional monarchy, with a king and a parliament of two houses, the house of lords consisting of about 670 hereditary peers, 24 spiritual peers, 15 Scottish representative peers, a number of Irish representative peers (in 1946, 8; vacancies were no longer filled) and a few life peers holding high judicial office; and the house of commons numbering 640 members, elected by universal suffrage. Area: 93,667 sq.mi. of which England (including Monmouthshire) covers 50,870 sq.mi.; pop. (census Aprıl 27, 1931), 46,212,308, of whom England had 37,794,003; (est. June 30, 1938, exclusive of army, navy and merchant seamen abroad) 47,676,000, of whom England had 39,050,-780; (est. June 30, 1946, members of the armed forces excluded) 47,175,000, of whom England had 38,866,000. Capital: London (pop. est. June 30, 1938): city and metropolitan police districts, 8,655,000; city and metropolitan boroughs only, 4,062,800. Chief towns (est. June 30, 1938): Glasgow (1,126,800); Birmingham (1,041,000); Liverpool (827,400); Manchester (732,900); Sheffield (520,000); Leeds (494,000); Edinburgh (469,700); Belfast (438,100); Bristol (415,500). According to the 1931 census, only 63,757 inhabitants of the United Kingdom were foreign-born. Religion: in England the Protestant Episcopal Church, established by law, and governed by two archbishops and 41 bishops, with (1936) 2,382,857 Easter communicants; the Presbyterian Church, established by law in Scotland (with 1,288,500 communicants); the largest Non-conformist bodies in the United Kingdom were the Methodists (828,950 members in 1937), the Congregationalists (467,490 members in 1937) and the Baptists (392,535 members in 1937); the Roman Catholics were estimated in 1937 at 3,386,000 and the Jews at 340,000. Languages: English is almost universally spoken, but in Wales 3% of the population (77,932 in 1931) speak Welsh only and 31% speak both languages; in Scotland 15% speak Gaelic only and 2.69% speak both languages; in the Isle of Man 528 speak English and Manx. Ruler: King George VI, succeeding to the crown on the abdication of his elder brother, King Edward VIII, on Dec. 19, 1936. Prime ministers: Stanley Baldwin (later Earl Bal win of Bewdley) (June 7, 1935-May 28, 1937); Arthur Neville Chamberlain (May 28, 1937-May 10, 1940); Winston Spencer Churchill (May 10, 1940-July 26, 1945); Clement Richard Attlee (after July 26, 1945).

At the Opening of the Decade.-The year 1937 opened for Great Britain in relative calm but with the danger of war more clearly before people's eyes than ever before. The years 1935-36 had been troubled and anxious. The failure of the League of Nations to impose effective sanctions upon Italy had been followed by Italy's swift conquest of Ethiopia. Hard on that had come Adolf Hitler's occupation of the Rhineland, a break not only of the treaty of Versailles but also of the "freely negotiated" treaty of Locarno (1925). The whole territory of the German reich was under Hitler's control and could be fortified. In Spain the civil war between the forces of Francisco Franco and the republican government had broken out and a victory for Franco, which seemed to become more probable, would be, in effect, a victory for Hitler and Benito Mussolini, who openly supported him. In the far east Japan's steady aggression on China became more and more menacing.

At home the British people in Jan. 1936 had mourned the death of their much respected King George V. His eldest son, who had succeeded amid general good will as Edward VIII, had abdicated in Dec. 1936 in deference to the advice of his ministers and the general judgment of his people, whose concern for the traditions of the throne forced them to disapprove their king's taking as his consort a woman twice divorced. But the accession of King Edward's brother, the duke of York, as George VI and of his wife as Queen Elizabeth with two princesses as heirs had steadied the national sentiment. The political situation was stable. The Conservative prime minister, Stanley Baldwin, retired from office on May 28, 1937, and was succeeded by his chancellor of the exchequer, Neville Chamberlain, who was known to be a capable and steady man of affairs. The house of commons elected in 1935 supported the Conservative ministry by a majority of two to one. The Labour party led by Clement Attlee, supported by 150 members, played the traditional role of opposition. The Liberal party proper, led by Sir Archibald Sinclair, also criticized the government, but a section of Liberals under Sir John Simon, the eminent lawyer who succeeded Chamberlain at the exchequer, held office in the Conservative coalition government, styled "national government." Anthony Eden, one of the younger Conservatives, was at the foreign office and was believed to represent the more active spirit of opposition to the European dictatorships.

The major problem at home was that of unemployment, which had been a chronic source of dissatisfaction since the year 1921. The different parties attributed its existence to different causes and prescribed different cures. The Conservatives in general believed that the protective duties which they succeeded in imposing in 1932 would go far to reduce this evil. The Labour party believed it to be an inevitable consequence of the capitalist system, curable only by socialism. The Liberals believed that free international trade was the solution, and some Liberals and many Conservatives held also that restrictive practices by trade unions and government interference in business had an adverse effect. Yet by previous standards the year 1937 was one of relative prosperity. Exports were £77,000,000 above those of the previous years and most important trades showed improvement.1 Although toward the end of 1937 there was a rise in unemployment, the average for the year, 1,484,000 registered unemployed persons, was only just over half of the 2,845,-

ooo of 1933. Unemployment in the years between the wars in Britain was particularly bad in certain areas. The government tried to improve conditions by scheduling certain districts as "special areas" (q.v.).

Beginning of Rearmament.-Yet one factor made for greater activity and re-employment in the heavy industries. Great Britain was rearming. Slowly, very reluctantly, the people and government had responded to the threat of Hitler's rapid and terrifying rearmament. From 1934 onward the sums voted by parliament for defense had begun to increase. In 1937, in addition to the usual sums voted out of taxation, there were added sums from a defense loan. The net sums to be spent on defense in the year 1937-38 (the financial year running from April 1 to March 31) were £105,000,000 on the navy, £82,000,000 on the army and the same amount on the air force, a total of £269,000,000. Great Britain after 1919 had never been an unarmed country. By the Washington treaty of 1922, naval parity with the United States had been established, as had a 5 to 3 superiority in capital ships over Japan. Both countries maintained an air force, reckoned for 1937 in books of reference at about 2,400 first-line aircraft, and rivalled only by France, Italy and Japan and possibly the mysterious growing force of Germany. Britain, like the United States, refused from policy, tradition and conscience to maintain large armies. A peacetime strength of just over 150,000 land forces was supposed to meet the need for security of each of these two great powers.

The expansion of British armed forces was slow and the speed of re-equipment depended on planning mass production, the fruits of which must be delayed. The danger against which the government was preparing, if mysterious in extent, was certainly terrible in nature. The public did not know accurately how great it was; some underestimated it, others took a wildly alarmist view. All were agreed on one thing; all wanted peace. From high tory to the extreme left wing there was agreement on this. But there was no agreement on the means by which peace was to be secured. The Conservatives, on the whole, believed that it might be preserved by agreement and negotiation. The radicals, regarding Hitler and Mussolini as irreconcilable enemies of democracy, felt they must be withstood, if necessary by force. But in the past, the radicals had in all sincerity denounced the notion of a "national war." They hoped that the dictators might be stayed by use of the collective security system of the League of Nations and by any other states which might join the League to enforce peace. The Conservatives had little confidence in this policy and while rearmament was still incomplete, felt bound to negotiate as best they might with what they hoped might not prove totally irreconcilable enemies. It was against this background of fear of war, tardy preparation for war and totally varying conceptions of how war might be avoided that British political history at this time must be viewed.

The year 1937 opened with attempts by the British government to find agreement with Germany and Italy on the banning of volunteers to fight in the Spanish war. The opposition was dissatisfied and accused the government of insufficient firmness. The most effective effort by France and Great Britain in the Spanish problem was the agreement made at Nyon, near Geneva, to take strong action against attacks on shipping by submarine or aircraft in the Mediterranean. This policy was completely successful and it gave comfort to those who believed in a firm front against the dictator states.

Throughout the next two years, however, until the final

¹Exchange rate of the £—annual average: 1937 \$4.9444; 1938 \$4 8887, 1939 \$4 435, 1940-44 \$4 035, 1945 \$4 034, 1946 \$4 034

victory of Franco in Feb. 1939, the Spanish question alarmed and embittered British politics. To the whole-hearted Socialist, it was agonizing to see his "comrades," the Spanish workers, defeated and oppressed while the so-called "democratic" governments of Britain and France looked on helplessly. Even to those who had their doubts about the merits of the republican cause it was extremely disquieting to find that the new government of Spain was the debtor and presumably the ally of the dictators of Italy and Germany.

Coronation and Imperial Conference.-The nation turned aside from foreign alarms and political struggles to celebrate the coronation of King George VI on May 12, 1937. Attended by eminent representatives of all nations, the coronation also brought the leaders of the self-governing dominions to London, and after the ceremonies were over an imperial conference was held. The prime ministers of Canada, Australia, New Zealand and South Africa conferred with the British minister on common problems of defense, trade and colonial affairs. On foreign affairs the assembled prime ministers issued a public declaration in favour of the preservation of peace: they affirmed that their respective armaments would never be used for aggression or for any purpose inconsistent with the covenant of the League and the pact of Paris (Kellogg-Briand pact). They declared themselves attached to the principles of parliamentary democracy but held that differing political views should be no obstacle to friendly relations between governments and countries and that it would be disastrous if the world were to split into opposing groups of nations.

The country at this time was relatively free from strikes and trade disputes, but even at the time of the coronation the people of London were irritated and inconvenienced by a strike of busmen which was called in spite of a full investigation by a general board of inquiry and against the advice of the transport workers' leader, Ernest Bevin. In parliament the government suffered an unexpected reverse over its financial policy. In his budget proposals for the year Chamberlain had put forward a tax called the national defense contribution. This was a tax on profits of industries to be levied on firms which showed an increase of profit by more than $f_{2,000}$ after the year 1936. The motive behind the tax was moral and political. The government defense program was stimulating industries in many ways and it was felt that those who were profiting by the new government expenditure and the national danger must pay an additional share of taxes. The tax was indeed a conservative concession to radical ideas and from the first aroused much criticism.

At the end of May, Chamberlain, now prime minister, faced strong opposition. Hugh Dalton, the chief Labour party financial expert, criticized the tax as an insufficient check to profiteering in armaments, while the government's own Conservative supporters objected to the tax as a clumsy and dangerous interference with business. Chamberlain retreated before this storm of criticism and agreed to a much simpler and more moderate tax. The incident showed how British governments in the house of commons could be made to revise their policy without actually being defeated on a division. In the same session, the house of commons gave proof of its initiative by passing a bill to amend the law of marriage sponsored by A. P. (later Sir) Herbert, an independent member representing Oxford university. This greatly simplified divorce procedure and added desertion and insanity to the grounds admissible at law.

Defense Policy.-One major decision was taken in 1937

Prime Minister Chamberlain returning from his conference with Hitler on the question of German demands in Czechoslovakia. The meeting took place on Sept. 15, 1938, at Berchtesgaden

on defense policy. The government decided that the aircraft borne in ships of the royal navy should no longer be a part of the royal air force but should be controlled administratively as well as operationally by the admiralty. This settled a long-standing dispute and permitted the further organization of the fleet air arm in aircraft carriers which proved so fruitful in World War II. War and preparation for war thus remained prominent in public interest. In September interest veered round to China, where the bombing of Nanking by the Japanese and other events in the far east caused great anxiety. A great protest meeting in the Albert hall in London was addressed by the archbishop of Canterbury and speakers of all three parties.

All these protests, however, brought attention back to the problem of power and armaments. On this, the Labour party was much puzzled and divided. As it desired to check aggression it could not refuse to admit the need for arming, yet the leaven of deep pacifist feeling in the party made it hold back. The trade unions, whose willing co-operation was so important in the defense program, discussed the question at their annual congress in Sept. 1937. A statement of policy was prepared by the National Council of Labour: the government should invite powers which had grievances to state them and through the League of Nations these grievances should be considered but at the same time the dissatisfied nation should be offered political security and economic opportunity. On the other hand, continued the statement, the government must, "through the League, confront the aggressors with an emphatic superiority of armed force." This

policy was criticized at the trades union congress, but on a card vote was supported by 3,544,000 to 224,000. In November the text of a general bill for air raid precautions was made public and the house of commons discussed earnestly the possibility of large-scale bombing and measures of administration and relief. In army affairs Leslie Hore-Belisha, the new secretary of state for war, was making sweeping changes in conditions of service and appointing younger generals to high command.

Austrian and Czech Crises.—The year 1938 opened with no change for the better in the foreign situation, but at home the country was relatively prosperous, and housing and other social reforms were being pursued steadily but not sufficiently to satisfy the Socialist opposition. In Feb. 1938 a change for the worse came over German policy with the dismissal of Gen. Werner von Blomberg from the post of defense minister and the replacement of Konstantin von Neurath as foreign minister by Joachim von Ribbentrop. About the same time Eden resigned from the foreign secretaryship, being in disagreement with Chamberlain on the general line to be followed by British policy against the dictators. In March Austria was occupied practically in a day and annexed by Hitler to the reich. The shock to Britain was severe but no action was or could be taken. Italy, which in the early days of nazi-

Winston Churchill leaving a ministerial conference called at 10 Downing street upon news of the fall of Paris in June 1940

ism had shown some intention of preserving Austrian integrity, was now openly hostile to Britain and firmly bound to Germany. France was in the midst of a political crisis. In Britain there had always been a strong feeling, especially in radical circles, that it had been an error and injustice to forbid, as the Allies had done in 1919, an Austro-German union.

But scarcely had the Austrian crisis been "solved" when another even graver threat arose in Czechoslovakia. Hitler began to threaten this state and to complain of the illtreatment of the 3,000,000 Germans in Bohemia and Moravia. Once again British opinion was in confusion. The strong criticism of the treaty of Versailles which dominated political ideas in Britain and the United States had favoured a view which was very convenient to Hitler. His seizure of Austria had been "wrongful aggression" but the Austro-German union was, so it was thought, not wrong in itself. The inclusion of millions of Germans in the Czechoslovak state was to many Englishmen a wrong which should be righted, but not by force. Whether the criticisms of the treaty of Versailles which by 1938 were generally accepted, were right or wrong is a matter for historical dispute. The prime political fact in 1938 was that they were believed. Opposition to Hitler had therefore to be based not on the wrongfulness of his demands but on his methods and on his record as a tyrant, an anti-Semite, an enemy of the peoples, a danger to world peace.

Both conservatives and radicals were to some extent morally disarmed in calling for opposition to German policy. And it followed also that as Germany had won so much sympathy in the decade after World War I, France had lost sympathy. Nonetheless, English statesmen and the public looked to France to join in withstanding naziism. At the end of April 1938 the French prime minister and minister of foreign affairs visited London for conferences with Chamberlain and his advisers. But there was little that their combined wisdom could do. The Rhineland had been occupied in 1936. Though it was not yet strongly fortified, the French had lost the bridgehead from which to defend central Europe and relieve the Czechs. Konrad Henlein, leader of the Sudeten Germans in Czechoslovakia, was pressing for even greater concessions from the Czech government. In the hope of a settlement the British government sent an eminent senior statesman, Lord Runciman (formerly the Liberal president of the board of trade, Walter Runciman) to Czechoslovakia to try to reconcile Germans and Czechs. But the German government only increased the pressure. From late July to mid-September, Runciman remained in Czechoslovakia, becoming less and less hopeful of any settlement short of an annexation of territory by Germany.

On Aug. 13, impressive manoeuvres of the German army took place and at Nuernberg in September, at the annual nazi rally, Hitler referred in terms of scorn and loathing to the Czech president, Dr. Eduard Beneš. War seemed very near if Hitler was to be opposed.

There followed the long and agonizing crisis during which the people of Britain almost incredulously prepared for war, for mobilization and air raids. Although the government had passed legislation for air raid precautions and was considering evacuation of children and pressing on with rearmament, these measures were in a rudimentary stage and the public was not fully trained to co-operate in them. On Sept. 7 the first sign of a weakening in British policy appeared in a leader in the London Times which suggested in veiled terms that a revision of the Czech frontiers would be the safest and fairest solution.

This article was believed, rightly or wrongly, to have been inspired by the government. On Sept. 12 Hitler promised to support the Sudeten Germans with arms and the Czech government courageously replied to this by proclaiming martial law in the threatened areas. Chamberlain now took a decision which was, generally speaking, hailed with admiration at the time and condemned later. He decided to fly to Germany and seek a personal interview with Hitler. It was later suggested that his motive was to "save naziism" or to "save German capitalism." This was a view held on the left. From Prof. Keith Feiling's Life of Chamberlain (1946) it would appear that he was concerned only with averting war. It was, after all, that bid of flamboyant gesture in favour of peace that many people had said Herbert Asquith or Lord Edward Grey or some other European statesmen should have made to avert war in 1914.

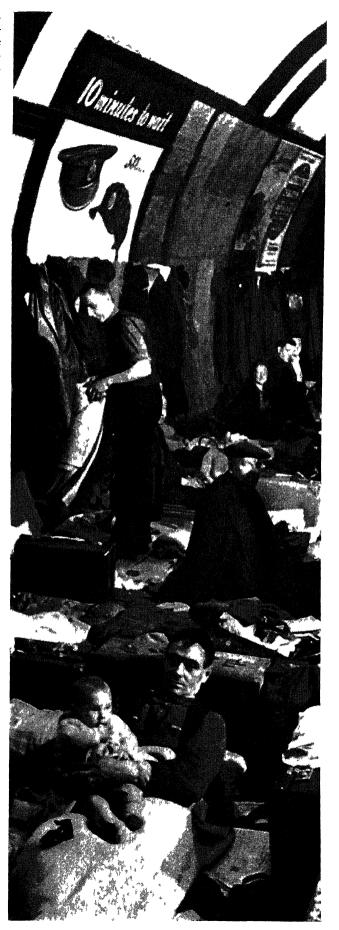

On Sept. 15, Chamberlain flew to Berchtesgaden in Bavaria. He returned and then secured the consent of the French and Czech governments to a proposal that the frontiers should be revised in Germany's favour. On Sept. 22 he flew to Germany again, Hitler this time coming to Godesberg on the Rhine to meet him. But now Hitler demanded that the new Czech frontiers should be fixed by Germany alone. War seemed only a matter of days and hours, and feverish preparations were made; air raid shelters were dug and old anti-aircraft guns were brought out. What was more serious was that on Sept. 28 the order was given to mobilize the navy. Also on Sept. 28 the house of commons met to receive a statement from the prime minister.

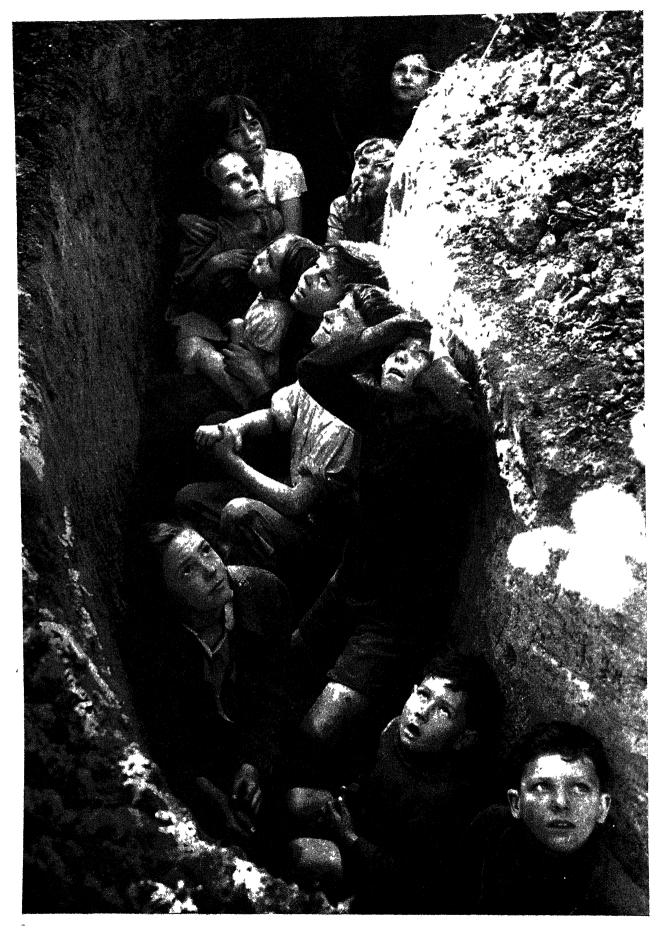

The nation looked for the news of impending war, but at the last moment Chamberlain announced that through the intervention of Mussolini it had been decided to hold a Four-Power conference at Munich immediately. This meant a respite, and when Chamberlain returned from the Munich conference with news of an agreement the relief of the public was unbounded. Peace had been saved.

The enthusiasm did not last, for it speedily appeared that the agreement had been a surrender in all matters of substance. Public opinion divided itself sharply. Chamberlain, who had been cheered whenever he appeared in the newsreels, was soon booed by large sections of the audience. Winston Churchill, who, never having been a member of any government since 1929, was in a position of freedom, denounced the surrender. Alfred Duff Cooper, first lord of the admiralty, resigned. Attlee, Sir Archibald Sinclair, the Liberal leader, and the left generally protested against the surrender, the betrayal of Czechoslovakia, the defeat of democracy. But there was great confusion in all parties. The left was the party of peace; it was this party which first of all in 1919 had led the hue and cry against the peace of Versailles, almost writing Hitler's speeches in advance. It had asserted that wars were made only by capitalists, imperialists and profiteers. Many said that a terrible error had been made in not inviting the U.S.S.R. to the conference, but it was well understood that Hitler would never have accepted such a proposal. Three by-elections took place shortly after in which Munich was the main issue. At Bridgewater in Somerset, Vernon Bartlett, a radical journalist, won the seat on an anti-Munich platform. But at Oxford the radical candidate, A. D. (later Lord) Lindsay, was unsuccessful. In West Perthshire the sitting member, the duchess of Atholl, a Conservative, resigned her seat to test opinion and stood as

One of the underground stations which served Londoners as air raid shelters and make-shift living quarters during World War II.

This shelter was in the West End

anti-Munich. But a government pro-Munich candidate was returned. In dividing on the question of Munich and of war or peace, the younger members of the public seemed to feel the shame more bitterly and to resign themselves to the necessity of eventual war; the older were the more pacific. The notion that "old men made wars for young men to die in" received no support from Britain in 1938–39.

Hitler lost no time in stating that he attributed his victory purely to fear and not to any good will. Coming to Saarbruecken, as far west as he could go in the reich, he made on Oct. 9 an extremely hostile speech against Britain, practically threatening that if Churchill, Eden or Duff Cooper were to enter the cabinet there would be war. The Italian problem was now relatively a minor matter but still of great importance. Italian broadcasts were inflaming Arab opinion against Britain in the middle east, for at that time it was the Arabs who were most belligerent in Palestine and against whom measures had to be taken by British armed forces. An agreement on political and economic matters between Britain and Turkey slightly improved British prospects in the Levant. An agreement made with the Irish government ended a dispute of five years standing over land annuity payments refused by Eire and recouped by Britain in the form of additional payments. In Nov. 1938 the Anglo-U.S. commercial treaty was completed and gave hope for larger British exports to the United States if peace should last. In Dec. 1938 the British people passed what was perhaps the uneasiest Christmas in their history.

Breakdown of Appeasement.-The uncertain peace with which 1939 opened depended on the threefold assumption that Hitler was satisfied with the Munich agreement; that he had a genuine fear of war; and that his statement that he had no further territorial demands to make in Europe was true. In March 1939 all three assumptions were shown to be groundless. On March 16 Hitler ordered his troops to march into the diminished and now defenseless territories of the Czechoslovak republic, and Prague was occupied and visited at once by Hitler. The former Czech territories were proclaimed a protectorate under the old names of Bohemia and Moravia. The Munich agreement was recognized by all to have completely failed as an attempt at appeasement. It could only be defended, if at all, as a necessary surrender to Germany's supposed military superiority at the time. The effect on British opinion was to bring parties together and to produce a united front. The prime minister, Chamberlain, was guarded in his first statement to parliament, but on March 17, speaking in Birmingham, he was clear enough. The whole nation listened to him on the radio while he asked, "Is this the end of an old adventure or the beginning of a new?" He struck a new note of hostility to nazi Germany when he observed, "Perhaps most sinister of all, we hear again of the appearance of the gestapo in Prague." This was to recognize the nature of the nazi state as a cruel tyranny and to stiffen British feelings of resistance. Greater unity at home was accompanied by closer and swifter action with France. A formal visit of the French president, Albert Lebrun, took place on March 21 and the solemn reception in Westminster hall of the president by the king and both houses of parliament emphasized the close ties between the two countries.

As the next victim of Hitler was obviously Poland, the British government on March 31 declared that in the event of a German attack it "would lend Poland all the support in its power," and the French government adhered to this

Curiosity overrode fear in the faces of these English children who took shelter in a ditch during a German air raid in 1940

guarantee. Fuller and more formal guarantees were given later both to Poland and to Rumania and financial credits were arranged. These signs of firmness were all the more necessary because on Good Friday, April 7, 1939, Mussolini occupied Albania with overwhelming force and showed himself as unsatisfied in his sphere as Hitler. The ends of British policy were now clear and had general support. What might still be in dispute was the means.

In April a bill was introduced into the house of commons to give the government and all local authorities stronger powers in matters of civil defense, which meant primarily precautions against air raids. By Aug. 1, 1,900,000 men and women had been enrolled in civil defense services and 1,000 steel air raid shelters had been delivered. On military preparation there was less unanimity, and when the government on April 26 announced its intention of imposing compulsory military service the left parties, Labour and Liberal, offered some opposition in parliament and still argued for voluntary recruitment. Later on in the summer the first recruits were called up. A ministry of supply was also created to direct and unify government purchases of war material.

It was recognized that the United States under President Roosevelt would be in sympathy with British resistance to aggression but would not go to the length of direct participation in a war. In May and June King George and Queen Elizabeth visited Canada and went on to Washington to be the guests of the president. But soviet policy was obscure. The only power with a land army comparable with that of France and Germany was an enigma. British opinion on the U.S.S.R. was very largely determined by people's socialist or antisocialist proclivities. The Socialists believed that the capital sin of Munich was the absence of the Russians from the conference. If only, they said, Great Britain had a real democratic people's government whom the soviet union could trust, then its support would be assured. Conservative opinion was inclined to doubt; the will and the power of the U.S.S.R. to intervene was questioned. By this time, so desperate was the situation that almost everyone was prepared to accept the soviet's support, except the small section of open pro-fascists led by Sir Oswald Mosley.

No sign of intervention came from Moscow. On May 3, 1939, Maxim Litvinov, the U.S.S.R.'s supposedly "pro-League of Nations" foreign minister, resigned his office and was replaced by Vyacheslav Molotov. Undeterred, the British government sent a special mission to Moscow under a diplomat, William Strang. In Aug. a combined French and British military and naval mission went to Moscow. They were there when the world received news on Aug. 21 that the soviet government would sign a pact with Ribbentrop, the German foreign minister. Just as the occupation of Prague united British opinion, the Moscow pact united it further, with the exception of avowed Communists who from this moment until the invasion of the soviet union by Hitler in June 1941 were averse to British participation in the war and proclaimed it to be another war of capitalist imperialism.

On hearing the news of the Moscow pact, Chamberlain at once returned from his holiday in Scotland. Parliament was convened and the prime minister declared that British policy with respect to Poland was unchanged by the conclusion of the pact. The house of commons supported him by 427 votes against 4. On the same day the Emergency Powers act was passed through all stages in both houses and received the royal assent that evening. It conferred unprecedented powers on the executive in the event of war.

The ruins of Coventry still obscured by smoke after the devastating night attack by German blitz-bombers in 1940

Nine days after announcement of the Moscow pact the expected invasion of Poland began. The public expected immediate war but the actual declaration did not come until midday on Sunday, Sept. 3. A last attempt to mediate by Mussolini had been permitted, and when it failed the British and French governments sent Hitler an ultimatum demanding a withdrawal from Poland of all German troops.

Early Phases of the War.—The first political step taken by Chamberlain was to broaden his government. He offered to include the opposition Liberal and Labour parties but failed to get their confidence and support. Two prominent Conservative leaders, Winston Churchill and Anthony Eden, accepted office, Churchill as first lord of the admiralty, the same post as he had held in 1914, while Eden went to the dominions office. For directing the war more effectively a war cabinet of nine members was set up; it included Churchill.

Throughout 1939 the civil authorities of Great Britain had been preparing a scheme for the evacuation of women and children from the large and vulnerable cities to areas supposed to be safer, where they would at any rate be dispersed. A million and a half people were thus evacuated in the days just previous to the outbreak of war and the whole scheme worked with astonishing smoothness. It was probably the greatest single population move in British history. Gas masks were supplied to the whole population, and the civil defense forces now numbered 2,500,000. To their surprise they had nothing to do. It had been expected that air raids on London and other cities would begin at once. For the first nine months of the war the large army of air wardens and others waited for bombs that never fell.

The government which led the British nation into the war had full support from the public for its action, but it had not general confidence. In the days just before and after the outbreak of war, Chamberlain recovered some of his prestige and authority but there was a widespread feeling that he was too old, too unadventurous and too civilian in his experience to be a real war leader. The strange and for the most part depressing course of events abroad weakened his prestige even when, as sometimes happened, he could not be in any way blamed for them.

In the first winter of war the British people were comfortable enough in their physical circumstances. Rationing was begun, first of meat, then fats and gasoline, but dict was still plentiful and good. The blackout at night was troublesome but people soon became used to it. The German submarine blockade was kept well within bounds. The most alarming event was the magnetic mines in estuaries and harbours. But this was overcome by the skill of the naval authorities. Protected by the convoy system, British trade continued to flow and there were large quantities of consumer goods still in store.

But if they were comfortable physically, the people of Britain were uneasy in their minds. A British army was in France under the supreme command of French Gen. Maurice Gamelin. Yet there was no fighting. A few German air raids on the northeast of Scotland had done little harm. Yet everyone felt that the real war was still to come. In December the Russians invaded Finland and the British and French governments joined with other states in the League of Nations in condemning this aggression. The unity of the left in England was threatened, but on the whole it was only a small number of Communists and crypto-Communists who sympathized with Russia. There was a general desire to help Finland, but as neutral Sweden refused to permit supplies to pass, nothing could

More serious were the events of the early spring of 1940. The sudden invasion of Denmark and Norway, including the occupation on April 9 of Oslo and parts as far north as Narvik, was a staggering blow to British confidence and seemed to reflect on the foresight of the government and the efficiency of the admiralty. Although the German destroyers in Narvik bay were sunk and the port eventually recaptured, a force landed farther south to recapture Trondhjem was unable to advance and had eventually to be withdrawn in the first week of May. On May 7 and 8 an angry house of commons debated the Norwegian situation and the government found itself attacked from all quarters; not only Attlee (Labour) and Sinclair (Liberal), the official opposition, but independent Conservatives such as Leopold Amery and Richard Law joined in. Churchill as first lord of the admiralty defended his chief and his colleagues, but on a division the government had a majority of only 80. This was less than half its usual majority. Chamberlain regarded the slump as a vote of no confidence and resigned on May 10.

Churchill Coalition.—If there had been any doubt as to who might succeed it was dispelled by the news on that day that German armies had invaded the Netherlands and Belgium and were taking the offensive with tremendous air support against the whole Franco-British army. Throughout the winter the public had been turning more and more to Churchill. He impressed people as a man who understood war, who had held high office through the preceding war and who had more than any other statesman warned the nation against strategic dangers and weakness both in rearmament and foreign policy. His broadcasts were the only speeches which really heartened the listeners, and people came to feel that this descendant of the great duke of Marlborough was the only man to surmount so terrible a crisis.

With the accession of Churchill the nation had at last a real national government. He included in his cabinet the principal Labour leaders, Attlee as deputy prime minister, Herbert Morrison as home secretary, Ernest Bevin, the former trade union leader, as minister of labour and national service. The Liberal Sir Archibald Sinclair was air minister, and a former Labour first lord of the admiralty, A. V. Alexander, took over the department from Churchill. Among prominent conservatives who remained in the government were Eden, who went to the war office, Lord Edward Halifax, who remained at the foreign office, Sir John Anderson, who was a member of the war cabinet, and Sir Kingsley Wood, chancellor of the exchequer. Chamberlain himself served in the new government in a nonadministrative office to encourage his friends to give it every support. So strong was the support given to the new government that there was no one in the house of commons who could be recognized as leader of the opposition. Enemies it had in the house, but these were isolated individuals, notably Aneurin Bevan, a Welsh Socialist who was always extremely outspoken against Churchill.

The nation watched with alarm the swift German conquest of the Low Countries and France. So swift was it that when on June 5 the last British troops had been evacuated from Dunkirk with the loss of all their equipment this was hailed as a great deliverance, since it had seemed probable that the army would be surrounded and captured. Until the final capitulation of the French government was signed on June 22, every effort was made to assist France, and on the political side Churchill made his famous offer of a union of the two countries. When at last the British people realized that they stood alone there was an even

greater rallying of national unity. In the brilliant summer weather of that year, so favourable to air raids and invasion, the efforts of the whole people were bent on supporting the government in every demand it made; in the factories there were tremendous feats of production. From this time onward to the end of the war it became difficult to distinguish between the civil and military history of the country. The whole able-bodied population became engaged in some kind of war effort; there was even conscription for factory work both of men and women. The forms of service more immediately connected with the war were the civil defense services, including a huge auxiliary firefighting service, the royal observer corps which traced the movements of all aircraft friendly or hostile, and the home guard which was formed for defense against invasion and grew rapidly to 1,500,000 men covering every parish in the land. There was no normal working day. After the usual hours of work men had to serve as wardens or to train as home guards or go to the observation posts to scan the sky. It might be thought that this would bring all ordinary educational or cultural life to an end, but this was not the case. The school education system was kept intact, although many schools had to be evacuated for fear of air raids or because of actual destruction. The universities, with depleted staffs, kept in operation. The armed services used the universities for training cadets specially selected from the schools. With increasing difficulties publishers kept up a supply of new books. Long evenings at home or waiting for duty encouraged reading and reflection. Unlike World War I it was a very political war. Plans for reconstruction were discussed, royal commissions and departmental committees worked at projects for social betterment and Sir

British women war workers engaged in the mass production of Sten sub-machine guns. Women became subject to the labour draft in 1943

505

William (later Lord) Beveridge produced his famous plans for fuller social insurance and for full employment. In all the services there were lectures and classes and the army had a large education department.

Parliament never relaxed its vigilance over government. Many matters had to be dealt with in secret sessions, the secrets of which were remarkably well kept. Some matters dealing with military plans and scientific secrets could never be mentioned at all. But debate remained lively and the institution of questions to ministers was as vigorously used as ever. For example, during the battle of Britain in Sept. 1940, questions were continued after the air raid warning had been given, the speaker only adjourning the sitting on receipt of the imminent danger warning but recalling the house for 20 minutes more of questions as soon as the "all clear" had sounded. The British Broadcasting corporation served the country well in spite of great technical difficulties and poured out a constant stream of propaganda in many languages. The need to learn the war news, the latest directions about food, security in air raids, clothes and gasoline rationing, etc., turned the whole nation into avid listeners to the radio. Talks on politics, culture, art, etc., had huge audiences.

Battle of Britain.—From the surrender of the French armies to the invasion of the U.S.S.R. by Germany in June 1941, the war history of the British people passed through two phases. The first was that of mere survival, from June to Oct. 1940. At any time during this period, an invasion was expected. The crisis was reached about the middle of September when the alarm was actually given and regular

soldiers and home guards took up action stations. The decisive air battle was fought at that time, ending in a defeat of the luftwaffe in spite of their numbers, skill and courage. The British fighter aircraft and pilots had proved to be superior.

The second phase was that of endurance, and began with the heavy air raids on London in Sept. 1940 and ended with the great raid of May 11, 1941, in which the house of commons building was burned out. The damage done in air raids was tremendous but the casualties were lighter than had been expected. It became evident that fire caused the greatest material damage.

The invasion of the U.S.S.R. (June 22, 1941) produced a change in the political atmosphere. The Communist party and its sympathizers who had until then been indifferent if not hostile to the war effort turned suddenly into its foremost advocates. It was now a people's war, a war of the workers, and the cry was raised that the British government must by every possible means "democratize" itself and demonstrate to the conquered peoples of Europe that Britain and the soviet union were the firmest of allies and united in favour of a socialist Europe freed from all reactionaries. The leaders of the Labour party had experienced too much trouble with the Communists to accept their propaganda, but there were large sections of British industrial workers who were greatly encouraged by the thought that now at last they fought side by side with their Russian comrades. As the German armies advanced swiftly and dangerously across the Russian plains the cry arose for more effective help until in 1942 and 1943 the slogan "a

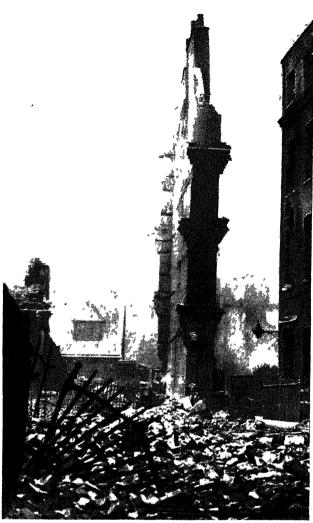

Night plowing on a farm in Kent. Fields were lighted by farmers' headlamps, introduced by the ministry of agriculture in 1943

second front now" was chalked up on walls and billboards. The government could do nothing to satisfy this demand for it was bound by strategic necessity, and all its resources were occupied in naval and air operations and in conquering the Italian East African empire and, later, in the desperate struggle in the western desert to defend Egypt and the Suez canal.

While one clearly defined and important section of the population looked to Moscow, the remainder of the population looked more to the United States. President Roosevelt's speeches were listened to with the deepest respect. The institution of lend-lease in March 1941 was recognized by Britain as a necessary step for the continuation of British military effort and the maintenance of civilian life. The security of Atlantic convoys was increased first by the exchange of 50 U.S. destroyers in 1940 for the lease of air bases and later by the actual participation of U.S. destroyers in convoy protection before a state of war existed between Germany and the U.S.A. When the attack on Pearl Harbor brought the U.S.A. into the war as a belligerent and Britain and the U.S.A. had both to face a dangerous and nearly successful Japanese attempt to dominate the Pacific and India, the mutual dependence of the two countries was made very clear. Moreover, U.S. statesmen and leaders in their public utterances never failed to speak the language of friendship while the chorus of admiration which poured out from Britain to the Russians in their sufferings and achievements produced but small response from Moscow. Nonetheless there was a double pull exercised on British opinion. Broadly speaking, those who thought in terms of social stability looked to Washington; those who thought in terms of social change or even revolution to Moscow; one was the great capitalist power, the other the great socialist power. The arrival of U.S. armies in Britain gave people a new feeling of friendship for the United States but the political consequences were difficult to discern.

Swing to the Left.-As the war continued it became clear that British opinion was moving to the left. Officially there was an electoral truce. When, on the death or resignation of a member of the house of commons, a by-election took place, the three main parties agreed not to contest each other's candidates. The party which held the seat before was expected to have the support of the other two for its nominee. At first, most by-elections were uncontested, but after the worst crisis of the war was over the independent mood of the electorate asserted itself. Assent to the electoral truce by Labour voters was at best formal. Their leaders loyally refrained from supporting an anticonservative candidate, but any candidate who presented a radical or leftist platform would win considerable support. Sometimes an independent would defeat the government conservative candidate. Where a Labour candidate had the right to stand in what had previously been a Labour seat no unofficial conservative ever appeared. A new party, founded by a former Liberal, Sir Richard Acland, called the Commonwealth party, secured some remarkable victories or near victories. It stood for very complete socialism, claiming to be superior to the Labour party because it was free from trade union bosses. The radical side, in fighting these elections and snatching seats from the Conservatives, could justifiably claim that the Conservatives had been given a huge majority in 1935 and that parliament was now out of date. Each year during the war it was prolonged by an act of parliament for a further year, this being possible under the flexible British constitution, but voices were raised in the house against this perpetuation of a house of commons so far removed from the circumstances of its first election.

A single wall of the former Sergeant's inn on London's Fleet street remained standing after one of the German air raids of 1941

And if the electoral truce broke down there was never in any sense a real political truce. The Labour party supporters refused to remain inactive and kept up a vigorous political life. In their view the only justification of the war was that it was a war for democracy; it could be won most quickly by a truly democratic government, and the peace to follow should see a democratic society in the sense in which the Socialists understood that term. Two examples may be given of the tendency of the circles of the left to criticize the government. The first was during the conquest of French North Africa when the U.S. authorities made an agreement with Adm. Jean Darlan and pursued what the radical London press called a reactionary pro-Vichy policy. The second belonged to a later period, when the British troops in liberated Greece were used to support the coalition government against the extreme radical elements of Greece (end of 1944). On this occasion, although an outstanding trade union leader, Sir Walter Citrine, had visited Athens and approved the action of the British military commanders, the Labour party in the house of commons showed extreme suspicion and on a division as many as 118 Labour members abstained from a vote of confidence which was carried mainly by the Conservative supporters of the government.

Economy of Total War.—The year 1942 was the most

critical period of the war after the survival from the invasion threat and the intensive bombing of 1940-41. The Japanese conquest of Malaya and Burma and Marshal Erwin Rommel's advance toward Alexandria roused the deepest apprehensions. But in the autumn there was a turning of the tide and the advance of the British army from El Alamein and the Russian advance from Stalingrad confirmed the British people in their belief in ultimate victory. During all this period to the very end of the war Churchill's ascendancy was absolute among the public, and when questioned or attacked in the house of commons he never failed to receive a vote of confidence. Even after the defeat in Africa he was supported by 476 votes to 25. There were no defections from the Churchill administration and fewer transfers of ministers from one office to another than in the years before the war.

The day-to-day life of the people of Britain was absorbed by two main concerns, security and production. Compulsory service in the home guard or in other defense service or in the national fire service maintained the force originally provided by voluntary enlistment. By the summer of 1942 the minister of production, Oliver Lyttelton, was able to state that British industrial production was at a far higher level than ever before in history. Two-thirds of the population between the ages of 14 and 65 were enrolled in whole-time service in industry, civil defense or the armed forces. Mechanical vehicles were being produced at the rate of 250,000 a year. In 18 months the production of aircraft calculated by weight increased two and a half times and the output of the shipyards by more than half. This work was accomplished with the aid of 5,500,000 women employed in factories. To make such war production possible the supply of civilian goods was reduced both in quality and quantity by government regulation. Clothes rationing had begun in the summer of 1941. Later simplified "utility" garments were manufactured which required less labour and material to produce. Books were published with narrow margins and on inferior paper, and the rationing of paper compelled publishers to limit severely issues of books even when in brisk demand. In July 1942 the small civilian "basic" ration of gasoline was brought to an end and only "essential users" could receive gasoline; they were bound, under penalties, to use their allocation only for the purposes and on the routes for which it was issued. Scores of thousands of cars were laid up until the end of the war. Business firms were often compelled by the government to concentrate only on certain kinds of production or even to close down in order that they might be taken over for war work. Manufacturers of foods and other commodities were "zoned" for distribution purposes and their products could be sold only in areas near the factory. Another method of saving transport was to "zone" retail distribution and dairies, laundries and other businesses arranged so that each firm would only serve a particular area. Competition began to disappear and the consumer lost his normal remedy of changing his dealer. Nonetheless, the public in general realized the sense and purpose of these measures and accepted them as a reasonable economy of effort.

The war presented a challenge to British agriculture greater than it had known since the end of the Napoleonic wars (1815). The Conservative government before World War II had encouraged production by subsidies for wheat and sugar beets. For war purposes the whole of agriculture became subject to government control. The ministry of agriculture in London and the departments of agriculture in Edinburgh for Scotland, and Belfast for Northern

Ireland prescribed the nature and areas of crops to be sown. In each county a war agricultural committee directed the farmers and gave technical advice and assistance. Food for direct human consumption was the chief aim of all these efforts. The area of land laid under the plow was increased; land which could not profitably be turned into arable in peacetime was plowed up, as a national necessity. As the health of the nation depended largely on milk production, every effort was made to maintain or increase the herds of dairy cows, to combat animal diseases and to improve the milk preservation in summer months. In 1942 milk consumption was as much as 15,000,000 gal. above the prewar average. The ministry of food by its rationing system ensured fair distribution. There was priority for nursing and expectant mothers, children and invalids; the average healthy adult had his milk supply seriously limited. The reports of the ministry of health throughout the war testified to the beneficial effects of "priority milk" on infants and school children. Summer time (one hour ahead of sun time) had been in operation in Britain from April to September after 1916, but in March 1941 a further measure was taken and for the period of midsummer the clock was advanced an extra hour. This was popular with the industrial population but added to the troubles of the farmers whose working hours depended on the sun. An increase in the arable acreage of 50% was achieved by British agriculture. Wheat acreage rose by 33%, oats by 60% and potato acreage by 100%. The sugar beet crop was sufficient to supply the civilian rations.

High-explosive and Rocket Bombs.—Direct attack on the British Isles ceased to be a serious danger to the national life, but day raids on the south coast and night raids inland continued to disturb the ordinary life of the people. In the summer of 1942 the Germans directed attacks on certain ancient cities, and these "Baedeker" raids did serious damage in Canterbury, York, Bath, Exeter and other places. Oxford, which had been prepared for attack, never received a raid, but some destruction was caused in Cambridge. Edinburgh was not subjected to any mass attack. In June 1944, however, just after the invasion of Normandy by Gen. Dwight Eisenhower's armies, a new and terrifying form of aerial attack was unloosed by the Germans. This took the form of the flying bombs styled by the Germans, the V-1 weapon. Kent, the south coast and the whole London area were within the range of these bombs, and the attacks could be continued by day as well as by night. In spite of the very prompt measures of defense by anti-aircraft fire, balloon and fighter aircraft, many flying bombs crossed the coast and roared on to their destination where, the propulsion failing, the bomb glided to earth and exploded. This new menace produced a further move of evacuation; many families who had returned from the safer areas once more left London and the southeast. Many older persons and children who had endured the night bombing were sent north and west by their relations. These attacks ended only with the occupation of the coast of France and Belgium by the Allied armies in the autumn of 1944. Just as this menace was disappearing there came another, which for many weeks was not mentioned by the authorities. This was the V-2 weapon, longrange rockets which approached at a speed faster than sound and were not therefore heard until they exploded. These, like the V-1 weapons, were directed mainly against London, whose inhabitants continued to suffer casualties and had to endure a further strain on their nerves and their vitality.

Last Phases of the War; Postwar Plans.-As the Allied

forces passed from defensive to offensive operations, important changes had to be made in the kind of munitions turned out in the factories, but this did not stop the rising volume of production. British economy was, however, seriously strained mainly as a consequence of gradually deteriorating coal production. The reduced numbers of workers in the coal mines were unable to maintain either the total volume of production or the output per worker. In 1943 output fell below the 1942 level and was further reduced by stoppages of work by the miners in certain areas. Coal-cutting machinery was in short supply, and in spite of attempts to provide better food for "heavy" workers, the men's physical condition was thought to be impaired. But the problem of coal mining was also a human and a political problem. The miners, living in their own little villages by the pits and feeling themselves to have suffered undeservedly from unemployment in prewar years, were the most difficult of all workers to deal with. The government by an "Essential Works Order" prohibited workers from leaving essential employment and this direction of labour had the support of the public as a wartime measure. It also had the effect of preventing an employer from dismissing an employee, and the managers alleged that it was ruining discipline. Additional bonuses for output and other in-

centives failed to arrest the fall in production. In Dec. 1943 the government decided to apply conscription of labour in the full sense of the word. A proportion of the men called up for military service were to be directed to the coal mines; they were to be chosen by ballot on enlistment. These conscripted miners became known as "the Bevin boys," so named after Ernest Bevin, then minister of labour. In 1944 the minimum wage for underground workers was raised from 83s. to 100s. but output further declined and occasional strikes continued. The problem of coal output continued into the time of peace and formed an increasingly serious danger to British prosperity.

As the prospects of victory brightened, the government began to lay down its plans for reconstruction and social betterment in times of peace. As a result of reports by committees of inquiry the government issued "white papers" containing statements of policy. These programs embodied a measure of agreement between the Conservative and Socialist wings of the coalition, but the Labour party could only accept them as an instalment of the socialism which they hoped to carry through after the war. They would not commit themselves to half-measures, however great the concessions might appear to be to the Conservative side. In the last resort, questions of principle were involved which only the electorate could decide. One great measure was put in the statute book. R. A. Butler, the minister of education, carried through an act extending and developing the school education, elementary, secondary and technical. This scheme was expected to take many years to fulfill. It provided for the raising of the minimum school-leaving age from 14 to 16 years as soon as the new buildings and the additional teachers of whom some 80,000 were required. could be found. The size of classes was to be reduced and women teachers were no longer required to resign on marriage. An amendment providing for equal pay for men and women teachers was carried against the government on the committee stage of the bill, but under strong pressure from the prime minister the house reversed this decision. A royal commission reported in 1946 on the implications of equal pay for men and women.

In the field of social security (q.v.) the government plan followed, but not completely, the scheme prepared

Trafalgar square, London, in May 1945, as the streets filled with celebrants rejoicing at victory in Europe

by Sir William Beveridge which was to cover all the contingencies of life from birth to death, by children's allowances; marriage, sickness and injury benefits; assistance in unemployment and widowhood and funeral grants to dependents. The estimated cost was £650,000,000 in the first year, as opposed to £441,000,000 spent on the then existing social insurance schemes, and it would rise by steps to £831,000,000 of which the state would pay £557,000,000, the remainder coming from individual contributions.

End of the Churchill Coalition.—By the spring of 1945 it became clear that with the advance of the Allied armies into Germany from east and west the nazi reich would soon collapse. The nation then expected to pass through an extended period during which the war in the Pacific would absorb most of its efforts; yet with peace in Europe some attention could be paid to reconstruction. The parliament elected in 1935 was by then ten years old; since the 17th century there had not been so long an interval between general elections. A general election was therefore expected. Churchill, however, made one attempt to maintain the coalition with a suggestion that the all-party government might be kept together until the end of the Japanese war and that the continuation of parliament until that period might be morally ratified (it required no legal ratification other than the usual Prolongation of Parliament bill) by a plebiscite of the whole electorate. Attlee and Sir Archibald Sinclair both refused to agree, and the Labour party conference which met at Blackpool in May 1945 rejected all further co-operation with Conservatism. Churchill then resigned his office, a step which involved the resignation of the whole ministry, and was commissioned by the king to form a new administration. He at once formed a cabinet, called a "caretaker government" consisting almost exclusively of Conservatives and that section of the Liberals, called "Liberal Nationals," who had co-operated with Conservatives before the war. Some eminent individual nonparty men, notably Sir John Anderson, the chancellor of the exchequer, also remained in office.

The wartime parliament had prepared carefully for the postwar elections. Arrangements had been made for voters absent on active service to vote by post or by proxy. In order to give time for the service vote to come in there was an interval of three weeks between polling day and the day on which the votes were counted. Absent voters' ballot papers were distributed and collected as far afield as Burma. The Conservative party presented 624 candidates for the 640 seats to be filled: the Labour party presented 604 and the Liberal party was able to put up only 307. There were only 21 Communist candidates. The election was felt by the public to be primarily a conflict between Conservatives and Labour, a conclusion fatal to the Liberals whose policies were not unpopular and generally respected.

The British system of election is by a simple plurality without any possibility of transferring the vote from one candidate in the event of his polling the lowest vote, to another. It was feared, therefore, that votes given to candidates other than Conservative and Labour would be wasted. There was a general feeling among the public that the nation would not reject Churchill, whose lead it had followed so loyally during the war. On the other hand Labour was expected to gain considerably. It fought with great confidence and nerve and the equalizing effects of war and the promises made by all of vast

social improvements turned people's eyes to Labour. The Conservatives had been in power with two very short intervals since the end of World War I and could not evade reproaches for "having lost the peace." On foreign policy there was not very wide disagreement between the main ideas of the two parties, but the Labour party claimed to be in a better position than the Conservatives to get on with the U.S.S.R. Labour stood for fully developed state ownership and control of industry, the first objective being the nationalization of the coal mines.

The result astonished all but a very few farseeing observers. With 392 seats, Labour commanded nearly two-thirds of the house while Churchill had only 213 supporters (the National Liberals included). There were 12 Liberals and only 2 Communists. The rest were independents or members of very small groups. The popular vote showed that 48% had voted Labour, 40% Conservative and "National Liberal," and 9% Liberal. The "swing" from Conservative to Labour, that is to say, the decrease in the Conservative vote compared with the preceding election (1935) and the increase in the Labour vote was 12%. Attlee, though, was in clear command of the house of commons. At seven in the evening of July 26, 1945, Churchill resigned and a few minutes later Attlee was asked by the king to form a new government.

Immediate Postwar Period.—The record speed with which the government changed hands was due to the fact that Attlee had to go to Potsdam at once and represent Great Britain in the discussions with President Truman and Marshall Stalin. No sooner was the new government installed in office than the use of the atomic bomb brought the Japanese war to an unexpected end. The plans of the government had to be suddenly adjusted to deal with peace in both hemispheres. As much as 55% of the country's labour force was engaged in war production; 5,350,000 men and women were in the armed forces, of which more than 2,000,000 were serving overseas. Demobilization was begun and based on length of service with priority for certain skilled workers and stu-

Prime Minister Clement Attlee and the archbishop of Canterbury (right) at Cambridge university, where each was awarded an honorary degree in June 1946. Preceding them were a herald and standard bearer

dents who had to go in for a long period of training. Large forces were still required for garrison duty and defense in many parts of the world. On Aug. 20, 1945, President Truman terminated the operation of the lend-lease agreements with a suddennness that came as a shock to British opinion. The war had resulted in the disposal by Britain of more than £2,000,000,000 of overseas investments and sterling. Balances due to other countries had accumulated to the amount of £4,000,000,000. On this single count the war had cost Britain more than £6,000,000,000. Negotiations were set afoot for a loan from the United States.

This was approved by parliament with some misgivings in Dec. 1945 and ratified by the U.S. congress in the summer of 1946. Britain was thus assisted in tiding over the period of postwar reconstruction and given a chance to restore its export industries.

The Socialist government proceeded without delay to operate its plans of nationalization. Acts of parliament provided for the transfer to the state, against payment of compensation, of the Bank of England, the coal mining industry, cable and wireless communications and civil aviation. These industries were now to be controlled by boards of management appointed by ministers of the crown. Sir Stafford Cripps, the Labour president of the board of trade, set up inquiries, under the name of working parties, into many other industries, such as cotton, pottery, boots and shoes, and furniture. At the end of 1946 legislation was introduced for the nationalization of all transport industries, i.e., railways, canals, long-distance road haulage and port facilities (docks). The Conservatives offered strong opposition to these measures, but the government with its majority of nearly two to one carried the program through smoothly. The building of houses had been the issue most canvassed at the general election and the new minister of health, Aneurin Bevan, decided to encourage municipal authorities rather than private enterprise to build the maximum number of houses. Prefabricated houses were to be used to meet the acute need. During 1946 the government's housing program moved slowly forward and was the object of much criticism. The lack of any new construction for six years, the destruction of more than 200,000 houses and the damaging of more than 4,300,000, made the satisfaction of the public demand for houses extremely remote. The cost of living threatened to rise on account of many wage increases but was kept down by government subsidies on essential foods. In Oct. 1945 it stood at slightly more than 30% above its prewar level. Austerity conditions still prevailed. A basic gasoline ration was restored in June 1945 and increased a year later. Clothing and other forms of rationing continued and in July 1946, John Strachey, the food minister, was compelled to introduce bread rationing. Hopes that this would be of short duration were dispelled by transport difficulties in the U.S.A. and elsewhere and by a calamitously wet summer which reduced the yield of the British harvest. The problem of fuel grew more acute in spite of a slight increase of coal production and the year 1946 closed with threats of industrial stoppages for lack of fuel and frequent cuts in electricity supplies. The first remissions in taxation were made by Dalton, the Labour chancellor, in April 1946 in the form of a cut of 1s. in the pound in income tax and more generous allowances for married men and small wage earners.

Labour's Foreign Policy.-Problems in the British em-

pire were acute and the Labour government, in fulfilment of its pledges to make India fully self-governing, authorized the viceroy, Lord Archibald Wavell, to bring together a government representing Moslems and Hindus. A special mission of cabinet ministers was sent to India to try to induce the rival Indian parties to co-operate, but with little success. The Hindu leader, Pandit Nehru, and the Moslem leader, Mohammed Ali Jinnah, came to London at the end of 1946 for a conference with the government, but the Moslems were not willing to trust to Hindu leadership. Dissension and civil war seemed possible. Already there had been widespread riots in various parts of India causing grievous loss of life.

At the end of World War II, the British people found that the Palestine problem was more acute than ever because of the large number of Jews who sought admission to that country. The British, as the mandatory power who had in the past to maintain a strong line against the Arabs, now found themselves denounced as national enemies by the Jews, and Jewish terrorists committed many outrages against the British troops.

The foreign policy of the government under Bevin had wide support, but in the same measure as the soviet government in its statements and policies became unfriendly British policy moved in close concert with the United States while making every effort to conciliate the U.S.S.R. A considerable volume of criticism descended on Bevin from a section of left-wing Socialists. In Oct. 1946 a group of Labour members of parliament challenged Bevin's policy in a debate in the commons but did not vote against the government. This disagreement was

serious, but the Labour movement on the whole supported the government and the opposition also approved Bevin's policy. The peace conference at Paris was long and contentious and the public viewed with alarm its protracted and acrimonious debates. When, however, the matters were transferred to meetings in New York city, there was an improvement as soviet policy seemed to relax. Bevin, before leaving the U.S.A. for his return to London, struck a note of optimism and declared that the "sun of peace would rise in 1947." (See also WORLD WAR II.)

Greece

A kingdom in the southern part of the Balkan peninsula. Area: 50,150 sq.mi. of which 41,328 are mainland; pop. (1928 census) 6,204,684; (1940 census) 7,344,860; (est. Dec. 31, 1946) 7,150,000. Chief cities (1940 census): Athens (cap. 481,225); Peiraeeus (205,404); Salonika or Thessalonike (226,147); Patras (79,570); Volo (54,919). Languages (1940 census): Greek 7,065,716; Turkish 133,-671; Albanian 25,100; Macedonian Slav 23,974; Koutsovlach (Rumanian) 23,845; Spanish* 22,725; Armenian 13,-075; Bulgarian 5,893; other 31,421. Religions (1940 census): Greek-Orthodox 7,090,192; Roman Catholic 29,136; Protestant 6,338; Mohammedan 134,722; Jewish* 67,591; other 17,441. King: George II (Sept. 27, 1922–Dec. 18, 1923, and from Nov. 25, 1935). Prime ministers: General John Metaxas (June 3, 1936–Jan. 29, 1941); Alexander Korizis (Jan 29, 1941-April 18, 1941); Admiral Alexander Sakellariou (April 20, 1941-April 21, 1941); Emmanuel Tsouderos (April 21, 1941-April 3, 1944); Sophocles Venizelos (April 14, 1944-April 25, 1944); George Papandreou (April 25, 1944-Jan. 2, 1945); General Nicholas Plastiras (Jan. 2, 1945-April 8, 1945); Admiral Petros Voulgaris (April 9, 1945-Nov. 1, 1945); Panayotis Kanellopoulos (Nov. 1, 1945-Nov. 21, 1945); Themistocles Sophoulis (Nov. 21, 1945-April 1, 1946); Panayotis Poulitsas (April 4, 1946-April 18, 1946); Constantin S. Tsaldaris (after April 18, 1946).

Experiment in Authoritarianism.—The year 1937 found the dictatorship, proclaimed by General John Metaxas (on Aug. 4, 1936), already in its second year. Some of the articles of the constitution of 1911 had been suspended, parliament dissolved and the leaders of the old political parties forbidden to take part in any form of public life. The dictatorship united all the political parties, whether of the right, centre or left, in opposition. No member of the Populist party, the principal royalist party, consented to join the government. Some of its leading members, notably John Theotokis, who, together with General George Kondyles, had been instrumental in bringing back the king in 1935, were placed under arrest. The various sections of the Liberal (Venizelist) party were also uncompromising in their opposition to the regime. Andreas Michalakopoulos and George Kafandaris, both of them former Liberal prime ministers, were exiled respectively to Paros and Zante.

In July 1938 there was an attempted uprising in Crete

British fleet in the port of Peiraeeus near Athens, shortly after the start of Allied operations in Greece, Oct. 1944. Athenians crowded the docks to welcome the new arrivals

led by Aristomenes Mitsotakis, a nephew of Eleutherios Venizelos, which, however, was suppressed without much difficulty.

The Metaxas dictatorship had all the features common to the authoritarian regimes of those days in the Balkans and elsewhere, namely suppression of political liberty, police rule, a controlled press, a government organized youth movement, etc. The objective critic, however, was bound to recognize certain material achievements of the regime. The most outstanding was undoubtedly the reorganization of the armed forces for which Metaxas, himself a distinguished staff officer, had all the qualifications.

The political dissensions of the republican period (1924–35), with the frequent military pronunciamientos by rival groups of army officers, had undermined discipline, destroyed the unity of the army and distracted the attention of the higher officers from professional to political issues.

An extensive system of fortifications, known as the "Metaxas line," was built along the whole length of the Graeco-Bulgarian frontier so as to protect eastern Macedonia and western Thrace against attack. The endurance of these fortifications, which had cost Greece the sum of 6,000,000,000 drachmae, was proved against the Germans in April 1941. Despite furious attacks by heavy armour and dive bombers the forts, manned by their heroic garrisons, held out successfully until the whole position was outflanked and taken in the rear by the German forces which had penetrated into Greece through Yugoslavia and reached Salonika via the Stroumnitsa and Vardar valleys. It is also doubtful whether Greece could have stood up with success to the Italian attack in 1940 had it not been for the thorough reorganization undergone by the Greek

^{*}Mainly Salonika Jews; most of these were deported and "liquidated" by the Germans in 1943-44.

armed forces during the previous five years, and this must be put down to Metaxas' credit.

The navy likewise was reorganized. Airfields, too, were enlarged and multiplied, the stores were gradually replenished, and a small but competent air force created from nothing. New planes and material were ordered.

Side by side with this intensive reorganization of the armed forces with which, given the then international situation, no one, whatever his political views, could well find fault, the years before World War II were a period of steady progress in all the fields of economic activity. In the sphere of social legislation, collective contracts fixing minimum rates of wages for manual and office workers were introduced in a large number of industries and other enterprises. The eight-hour day was generally adopted, compulsory holidays with full pay were widely applied, the organization of social insurance was developed. In general, it may be said that, during this period, Greece made considerable strides along the path of social reform. Against the above, must, of course, be set the restrictions imposed on the free functioning of the trade union movement by an authoritarian regime.

In foreign affairs, the policy of the Balkan Entente, begun under previous governments, was maintained. The bonds with Turkey, already drawn closer by the Graeco-Turkish agreement of Sept. 14, 1933, would, it was hoped, guarantee the security of Greece's northeastern territories in the event of a Bulgarian attack. After the Italian occupation of Albania in April 1939, which was immediately followed by the British guarantee to Greece, the latter, though continuing to maintain correct relations with the axis powers, found itself drawn closer and closer to Great Britain, though no formal alliance was concluded.

Economically, on the other hand, Greece, like the rest of the countries of southeastern Europe, was inevitably drawn into the German orbit through a system of barter, introduced by Hjalmar Schacht, which compelled countries exporting to Germany to take German goods in payment through the operation of blocked mark accounts. As Germany was Greece's principal customer for its main export commodity, tobacco, this could hardly be avoided, particularly as the British cigarette manufacturing interests were obdurate in their refusal to purchase Greek tobacco.

In 1940 the international situation, as affecting Greece, began rapidly to deteriorate. A violent press campaign, accusing Greece of fomenting trouble in Albania, was launched in Italy. It was obvious that Italy was bent on provoking Greece into taking action which might be used as a pretext for an attack. Thus on Aug. 15 the Greek light cruiser "Helle," while lying at anchor off Tinos during the celebration of the Festival of the Assumption, was sunk by a torpedo from an unknown submarine afterward proved by the fragments of the torpedo to have been Italian. Despite this knowledge, which was kept secret, the Greek government kept its head and repressed what might have been a premature outburst of public indignation.

Italy's Military Fiasco.—On Oct. 28, 1940, at 3 A.M., the Italian minister, Emanuele Grazzi, woke up the Greek premier and handed him an ultimatum demanding that Italian forces should be allowed to occupy strategic points on Greek territory for the duration of the conflict with Britain. Greece was accused of tolerating the use of its territorial waters and ports by the royal navy as well as of permitting the British intelligence service to operate in the Greek islands against Italy. The ultimatum was peremptorily rejected by Metaxas, who telephoned at once to the

Greek frontier posts on the Albanian border warning them of the impending Italian attack and instructing them to

A few hours later Italian troops, aided by Albanian irregulars, invaded Epirus. During the first few days they penetrated deep into Greek territory through the Pindus gorges, whence they were finally thrown back in disorder across the Albanian frontier through the heroism of the Greek troops, aided by the inhabitants of the mountain villages. While the left wing of the Greek army, under the command of General Alexander Papagos, advanced into northern Epirus and occupied Argyrokastro, the right wing, by a series of brilliant operations, advanced into Albanian territory from western Macedonia and occupied the important Italian base of Kartcha and shortly after took Pogradec, on the western shores of Lake Okhrid.

The Greeks had been united, as never before, in resisting the Italian aggression. All the leaders of the political opposition, without exception, declared themselves solidly in favour of the policy of the government. With the exception of the secretary general of the Greek Communist party, Nicholas Zachariades, no discordant voice was heard in favour of yielding or compromise. It was one of the greatest moments in Greek history.

In Jan. 1941 the entry of German troops into Bulgaria presaged the coming intervention of Italy's German ally in the Balkan conflict. The attitude of Prince Paul, regent of Yugoslavia, was vacillating, and this materially increased the perplexities of the Greek and British high commands who, before the German threat, were faced with the agonizing problem of whether to abandon eastern Macedonia and Salonika or to defend them. Metaxas had informed the British government that Greece would resist a German attack as it had resisted the Italian aggression. On Jan. 25, 1941, Metaxas died and his successor, Alexander Korizis, reaffirmed his predecessor's decision.

Submission to German Might.—On April 6, 1941, German forces attacked Greece from Bulgaria, while Yugoslavia was simultaneously assailed from three sides by German, Italian and Hungarian forces. Between March 7 and April 2 a British expeditionary force comprising British, Australian and New Zealand troops, under the command of General Sir Nigel Maitland (later Lord) Wilson, landed in Greece and was transported to positions in Macedonia on the Olympus-Vermion line, as previously arranged. But the forces were too uneven. The Germans were greatly superior in armour and air power. Further, the rapid collapse of the Yugoslav army left the way open for a German penetration into Greek Macedonia through the Vardar and Tcherna valleys. The Greek army on the Albanian front, whose rear was threatened by the German advance, capitulated on April 22.

As the Germans swept through central Greece toward Athens, it was decided that King George II, with the government, should withdraw to Crete which it was hoped would be held. Korizis, Metaxas' successor, committed suicide a few days before the Germans entered Athens. The king appointed as his successor Emmanuel Tsouderos, a former governor of the Bank of Greece, who belonged to the Liberal party. On April 27 the Germans occupied Athens.

Great hopes had been based on the possibility of holding Crete. But superiority in the air enabled the German high command, by an airborne operation, to seize the airfield at Malamé near Canea. The British and Greek forces were unable to hold the island and had to be evacuated to Egypt, together with the king and government, at the end of May.

In exile, the lawful Greek government, headed by the

king, who after a three months' stay in Cairo went to London in Sept. 1941, continued the struggle and the small Greek military, naval and air forces, reorganized and re-equipped with British help, fought bravely by the side of their British allies in the western desert, in the Mediterranean and later in Italy, at Rimini.

Special mention must be made of the contribution of the Greek merchant marine to the Allied cause. From the beginning of the struggle Greece had placed the whole of its merchant fleet at the disposal of the Allies. Most of the Greek ships were employed in the transport of food and supplies from the United States to the British Isles. Of the total Greek naval tonnage, that is, 434 ships totalling 1,361,332 tons, 75% were sunk, a crippling loss for the Greek economy. (See also World War II.)

The Occupation.—Inside Greece, the Germans set up a Greek government of their own choosing under General George Tsolakoglou, one of the corps commanders on the Albanian front, who, against orders, signed the capitulation of the Greek army in April 1941. Not a single one of the leading politicians who had remained behind took part in this quisling government, which was composed of second-rate men of no political standing.

After the occupation of Athens and the Peloponnesus, the Germans handed over the administration of southern Greece, Epirus and the islands (except Crete and the islands opposite the Turkish coast) to the Italians under General Carlo Geloso. They themselves remained in occupation of central and western Macedonia, with Salonika, Crete and the port of Peiraeeus. The Bulgars were allowed to occupy eastern Macedonia and Thrace as a reward for allowing the German army to pass through Bulgaria in order to attack Greece and Yugoslavia. Thus Greece was parcelled out into a number of watertight compartments under different military administrations, a fact which added greatly to the hardships of the occupation. There was no free movement of goods and persons between the various zones which were severally exploited by each occupying power for its own benefit. Further, the Italians, whose avowed intention it was to annex the Ionian islands (Corfu, Cephalonia, Zante), placed these islands under a separate administration and embarked on a policy of partial assimilation. The Cyclades also were separated from the jurisdiction of the Athens government and placed under the governor general of the Dodecanese, with headquarters at Rhodes.

The whole country was subject to a policy of ruthless exploitation. Immense quantities of foodstuffs and stocks of raw materials and manufactured articles were removed by the invaders and sent to Germany, Italy and Bulgaria or to Erwin Rommel's army in North Africa which was largely supplied from Greece. As the result of this policy there was wholesale famine and starvation during the first winter of the occupation (1941-42). With no food coming in from outside and with most of the local supplies drained off by the armies of occupation, there was very little left for the civil population. The mortality in Athens, the islands and the poorer parts of the country increased dangerously. This situation was only partially relieved when, as the result of strong appeals made by the Greek government in exile, the British government in the spring of 1942 agreed to relax the blockade and allow the import into Greece of wheat and a few other essential foodstuffs. These supplies were imported in Swedish ships and distributed under the control of the International Red Cross. This saved the Greek population from starva-

Resistance Movements.—Already in the first year of the

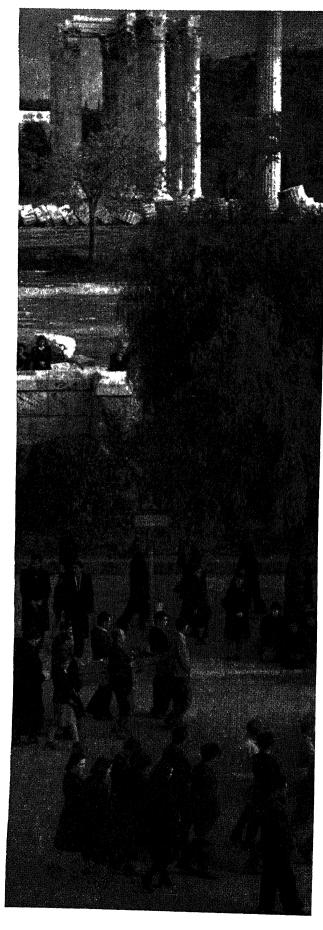

occupation a number of underground resistance movements had sprung up in various parts of the country. Espionage and sabotage were organized on a large scale by secret organizations mostly directed by Greek officers acting in liaison with the Greek government in Cairo and British headquarters in the middle east. Large numbers of British officers and men belonging to the British expeditionary force, who had found themselves cut off at the time of the evacuation, were hidden and helped to escape by the Greek population. There were numerous arrests and executions from this cause.

Early in 1942, bands of guerrillas began to be formed in the more mountainous regions of central Greece and the Peloponnesus. Some of these were purely patriotic and nonpolitical while others were organized by political parties. The most important patriotic organizations were E.D.E.S. (Ellenikos Dimokratikos Ethnikos Stratos, or Hellenic Democratic National army) under Gen. Napoleon Zervas, operating up in the northwest (Epirus), and E.K.K.A., (National Social Liberation army) under Colonel Dimitrios Psaros, operating in central Greece. On the other hand the Greek Communist party, in co-operation with certain other left-wing elements, organized their own bands, later grouped under a single military formation under Gen. Stephen Seraphis known as E.L.A.S. (Ellenikos Laikos Apeletherotikos Stratos, or Greek Popular Liberation army), which had ramifications all over the country.

In the early stages of this movement many persons, both among the peasantry and the bourgeois classes, joined E.A.M. (Ethnikon Apeletherotikon Metopon, or National Liberation Front), a left wing resistance group, under the impression that it was a purely patriotic organization. It was only later that the policy pursued by this organization, which aimed at monopolizing the resistance movement and eliminating all competitors by force, revealed its political objectives and the fact that it was dominated by the communists. The capture and murder of Colonel Psaros, leader of E.K.K.A., by the communist guerrilla leader Aris Voulouchiotis did a great deal to open the eyes of the public.

All the guerrilla bands, of whatever political complexion, received arms, equipment and financial assistance in gold from the British middle east command which also attached British liaison officers to the local guerrilla commands in various parts of Greece. During the earlier stages of this guerrilla warfare some important feats were performed, such as the blowing up of the Gorgopotamos bridge on the main railway from Athens to Salonika, thus disrupting the axis' communications. Later, however, the disadvantages of guerrilla bands operating independently and without responsible control became apparent. Desultory attacks on small axis contingents, of no great military value, resulted in severe reprisals, in the destruction of hundreds of villages, the killing of innumerable hostages and the massacre of whole populations. The feeling throughout the countryside which bore the brunt of these reprisals gradually turned against the bands. There were appeals to the German-controlled government in Athens for protection. This was the origin of the so-called security battalions organized by the Rhallis government (the third and last of the quisling governments) which in March 1943 succeeded the government of Professor Constantine Logothetopoulos, himself the successor of Gen. Tsolakoglou (in Dec. 1942).

House Divided.—The various rival resistance movements had been in a state of civil war since Oct. 1943.

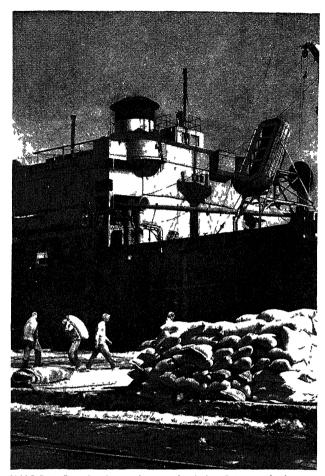

This state of things began to cause serious anxiety to both the Greek and the British governments. Appeals for unity were made over the radio by Emmanuel Tsouderos, prime minister of the Greek government, who returned to Cairo in March 1943. In the meantime, the extreme left, assisted by certain officers belonging to the republican centre, began to create disaffection in the ranks of the Free Greek forces in the middle east. This came to a head in the spring of 1944, when there were a number of lamentable mutinies among the Greek forces in the middle east and in the Greek fleet at Alexandria. These mutinies did immense harm to the national cause and were universally denounced within Greece itself.

After these events, the king accepted the resignation of Sophocles Venizelos (son of Eleutherios) who shortly before had succeeded Tsouderos as premier, and on April 25, 1944, entrusted George Papandreou, leader of the Social-Democratic party, who had but recently been brought out of Greece, with the formation of a government. On the latter's initiative, an all-party conference of members of all the Greek political parties and resistance groups was held in the Lebanon mountains (May 18-21, 1944). Its purpose was to attempt to solve the various political differences with a view to the formation of a broad-based government of national unity. Papandreou's program was accepted by all the parties, including, after considerable delay, the E.A.M. and the Communists. Eventually the new government of 25 members, which was finally constituted on Sept. 2, included seven representatives of the extreme left, the most important of whom were Alexander Svolos and Militiades Porphyrogenis. Shortly afterward the Greek government moved from Cairo to Caserta where, on Sept. 24, 1944, under the auspices of Sir Nigel Maitland Wilson, commander in chief of the Allied forces, an agreement was concluded (known as the Caserta agreement) under which the rival guerrilla organizations consented to place themselves under the authority of the Greek government and under the command of Maj. Gen. Ronald MacKenzie Scobie, designated to command the British forces about to liberate Greece

Liberation and Civil War.-At the time of the liberation of Greece (Sept. to Oct. 1944) the government had at its disposal only the few regular troops brought over from Italy and Africa, that is, the Mountain brigade and Sacred battalion, together with a small force of gendarmerie. As against these, there was a much larger E.L.A.S. guerrilla force, under E.A.M. control, in the Peloponnesus and central Greece, and General Zervas' small national force (E.D.E.S.) in Epirus. E.L.A.S. refused to comply with the terms of the Caserta agreement to place itself unreservedly under the orders of General Scobie. While the Germans were still in full retreat toward the north, E.L.A,S. bands began converging on Athens with a view to seizing power and establishing a communist-controlled government. On Dec. 2 the six E.A.M. ministers resigned from the government rather than sign a decree demobilizing the guerrilla forces. On Dec. 3 disorders broke out in Athens, and E.L.A.S. attacked the British and government forces. For a time the rebels were in nearly complete control of the capital and interior of the country. Great excesses were committed by their followers; it was only the timely intervention of the British troops commanded by General Scobie which, in the words of Winston Churchill, averted

Greek mourners following a funeral cortege of antigovernment demonstrators past the columns of the Temple of Zeus, Athens, in Dec. 1944

U.N.R.R.A. flour for Greece being unloaded at Peiraeeus harbour in 1945

a "horrible massacre" in Athens.

After Churchill's, Field Marshal Sir H. R. L. G. Alexander's and Anthony Eden's dramatic visit to Athens on Dec. 25, 1944, the British government intervened in a conciliatory spirit with a view to ending the bloodshed. As a first step in this policy of appearement and as a concession to the demands of the extreme left, the king, still in London, was persuaded to surrender his powers provisionally to Archbishop Damaskinos of Athens, who was appointed regent of Greece on Dec. 31. Papandreou resigned at the height of the troubles on Jan. 2, 1945, and was succeeded by a "strong man" in the person of General Nicholas Plastiras (the former leader of the revolutionary junta of 1922). A series of round-table conferences held between representatives of the government and the rebels ended in the conclusion of the Varkiza agreement (Feb. 12, 1945). This granted an amnesty for political offenses (but not for common law crimes) committed during the period of the troubles. It also provided for the disbanding of all E.L.A.S. troops and the surrender of their arms. Another stipulation was for a purge of the public services to be carried out after the holding of elections. The agreement laid down that, first, a plebiscite should be held on the question of the king's return and, later on, elections be held in the course of the same year. This order was later reversed under pressure from the left, who demanded immediate elections and the postponement of the plebiscite to a later date.

During the interval between the signature of the Varkiza agreement and the holding of the elections there was a succession of "service" governments presided over by

Admiral Petros Voulgaris, Panayoti Kanellopoulos and finally Themistocles Sophoulis, leader of the Liberal party, each holding office for only a few months (or weeks). It should be noted that all the above governments, appointed by the regent, were drawn from the republican centre, without any participation of the Populist party, which, although commanding a strong support throughout the country, remained out of office. As it became more and more evident that public opinion, under the influence of the excesses committed by the communists and their allies during the December troubles, was running strongly against the left, the extreme left, faced with the prospect of a resounding defeat at the polls, began to clamour for a postponement of the elections. This clamour influenced the attitude of the Sophoulis government, in power after Nov. 21, 1945, which not only committed itself to a postponement of the date of the plebiscite to 1948 but also seemed inclined to defer the elections to a later unspecified date. It was only under strong pressure from the Allied governments, and especially Great Britain, that the Sophoulis government was finally persuaded to hold the elections on March 31, 1946. In protest against the above decision the Communist and other parties of the left abstained.

Elections and Plebiscite.—The elections, as was foreseen, gave an overwhelming majority to the Populist party, that is, the principal royalist party, of conservative tendencies, which secured 206 out of 354 seats. The right centre parties (republican) led by Papandreou, Venizelos and Kanellopoulos, secured 68 seats, while the Liberals (republican) under Sophoulis secured only 48 seats. The remainder of the seats went to two small independent royalist groups led by General Zervas and Th. Turkovassilis. After the Populist victory at the polls, C. S. Tsaldaris was elected to the leadership of the Populist party and, in his capacity as head of the government and foreign minister, subsequently led the Greek delegation at the Paris peace conference.

The new chamber, the first to be elected since the suppression of parliamentary government by Metaxas on Aug. 4, 1936, had as its specific mandate to revise the constitution of 1911. At the same time the electors had made it quite clear that they desired an early proclamation of the plebiscite on the question of the king's return.

One of the first acts of the new assembly was to fix the date of the plebiscite for Sept. 1, 1946. This time the parties of the left did not abstain and, together with the Liberals, came out strongly in support of the republic. The plebiscite gave 70% in favour of the immediate return of the king and 30% against. The voting was: in favour of the king 1,170,470, against 523,086. Independent observers appointed by the British and the U.S. governments to supervise the elections and observe the plebiscite gave it as their opinion that both had been fairly conducted with a minimum of irregularities. On Sept. 28 King George II, who had been absent from his country since the German invasion in April 1941, made a triumphal entry into his capital.

* * *

No picture of Greece during the decade 1937–46 would be complete without some description of the devastation caused by World War II, a devastation which, owing to its extent, was bound to weigh heavily on the economic development of the country for at least a generation. The capital equipment of the country, laboriously built up

by the thrift and enterprise of two generations of Greeks, had been almost entirely destroyed. To take the railways and road system first, nearly all important bridges, tunnels and other major works were demolished by the axis; so

were the installations of the two principal ports, Peiraeeus and Salonika. The transport system was crippled by the destruction or removal of nearly all the railway and rolling stock, motor vehicles, coastal steamers and sailing boats. The losses in ocean-going merchant ships have already been mentioned. The Corinth canal, main artery of communications between Peiraeeus and western Greece, was blocked by the Germans at the moment of their retreat in Sept. 1944, by dumping into it a large number of locomotives and railway carriages and blowing in the sides. In the countryside some 1,400 villages were destroyed and more than 1,000,000 people rendered homeless. One of the heaviest losses to the country's economy was the devastation of forests over an area of nearly 2,000 sq.mi., representing one-quarter of the total forest area. Agriculture also suffered a heavy blow through the wholesale removal of agricultural machinery and the destruction of livestock which in most categories averaged 60%. To the above capital losses must be added the confiscation by the invader of an important stock of raw materials, foodstuffs, tobacco and manufactured articles, and the annihilation of all savings through the inflation of the currency which reached fantastic proportions under the occupation. The losses in human lives were also heavy in proportion to the population. Although no official figure was available by the end of 1946, they were estimated to be in the neighbourhood of 500,000.

Further, the health of the remaining population was undermined by undernourishment and privation resulting in an enormous increase of tuberculosis, malaria and other diseases. (C. S. T.)

Green, William

Green (1873-), U.S. labour leader, was born March 3, 1873, in Coshocton, O. He spent much of his youth as a miner, and at the age of 27 was a subdistrict president of the United Mine Workers of America. He was international secretary-treasurer of the U.M.W.A. from 1912 to 1924, and in the latter year was elected president of the American Federation of Labor. Under Green's administration, the A.F. of L. remained predominantly a crafts union. When the Committee for Industrial Organization (later known as the Congress of Industrial Organizations), a group of ten unions affiliated with the A.F. of L., opened its campaign to establish industrial unions, Green refused to sanction the operation. This led the C.I.O., under the guidance of John L. Lewis, to break away from the parent body in 1937. The A.F. of L. and the C.I.O. engaged in frequent jurisdictional disputes, and Green repeatedly denounced the Roosevelt administration, and particularly the National

Labor Relations board, as prejudiced in favour of the C.I.O. In Jan. 1942 Green and Philip Murray (who had succeeded Lewis as head of the C.I.O.) accepted Pres. Roosevelt's proposal that both unions agree to a labour truce for the duration of World War II.

Green generally declared himself against the principle of government intervention in labour-management affairs; he and the A.F. of L. opposed the wage-hour act in 1937 as well as the war-time legislation for the compulsory arbitration of industrial disputes. He was also opposed to communist activity in the trade unions; when the World Federation of Trade Unions conference was organized in 1945, Green declined to join primarily because of the inclusion of soviet trade union representatives. One old feud was officially terminated in Jan. 1946 when John L. Lewis, dissatisfied with C.I.O. policy, brought back his United Mine Workers into the A.F. of L.

Greenland

Greenland, the world's largest island (839,782 sq.mi., some 705,000 covered by glacier), is in the North Atlantic ocean, N.W. of Iceland. A Danish possession, it came under temporary United States protection in 1941. Capital, Godthaab. A population of about 18,000 (est. 1941) is scattered in small settlements on the west coast, and 1,000 on the east coast, about 600 in all being Danes, the rest native Greenlanders. Seats of the governors are Godhavn in the north and Godthaab in the south.

Climate and geographic isolation, plus sparseness of people and resources, made Greenland an unusually dependent colony. Denmark carefully regulated commerce and maintained a trade monoply, yet its rule was considerate and farsighted. Throughout World War II, local administration in the island remained in the hands of the Danish officials. However, communication with Denmark was entirely cut off, and new trade relations had to be established, chiefly with the U.S., to provide the necessities of life for the Greenland population.

Strategic Importance.—The significance of Greenland in the military situation during World War II was based primarily on two geographic factors: (1) The location there of the world's only cryolite mines, ore vital in the manufacture of aluminum, which in 1942 was taken from Greenland to Canada and the United States in quantity sufficient to pay for all the country's necessary imports; (2) The location on "Greenland's icy mountains" of the source of much of the weather conditions and weather reporting for the North Atlantic and much of Europe. By possession of meteorological stations there, the United Nations were enabled to plan their operations much more effectively than would otherwise be possible-and Germany was at the same time deprived of the opportunity of forecasting accurately the weather even over western Europe. A third factor of minor importance was that bases could be set up in Greenland from which to attack or to protect Atlantic shipping.

Hence Greenland could no longer live by itself. By 1940, Americans had begun to reread the Monroe Doctrine, had found that it laid a protective mantle over north as well as south, and the U.S. sent a consul to Godthaab.

In March 1941 the Germans extended their declared "war zone" to Greenland's three-mile line. A few days later, the U.S. consul reported a nazi bomber over Greenland, then another war plane. Reports reached Washington that the Germans were preparing in Norway an expedition to conquer Greenland.

Agreement with U.S.-Within two weeks (April 9, 1941)

Danish Minister Henrik de Kauffman signed the following agreement with U.S. Secretary of State Cordell Hull:

Art. 1. The U.S. recognizes the sovereignty of Denmark over Greenland; since there is danger that Greenland may become a point of aggression against the American continent, the U.S. accepts the responsibility to assist Greenland in the maintenance of her present status.

Art. 2. The U.S. may construct and maintain such landing fields, sea-plane facilities, radio and meteorological installations as may be necessary to accomplish the purposes of Art. 1.

Art. 3. Provisions of Art. 2 shall include the right to construct roads, deepen harbours, build fortifications, repair and storage facilities, housing.

Art. 4. The facilities so constructed will be available to all the American nations for purposes of defense of the western hemisphere.

Art. 5. The U.S. will have the right to lease necessary land and sea areas, but will give the fullest consideration consistent with military safety to the welfare of the native population of Greenland.

Art. 6. Denmark retains sovereignty over the defense areas, but during the term of the Agreement the U.S. shall have jurisdiction over such areas and over all military and civilian personnel therein except Danish citizens and native Greenlanders.

Art. 7. The U.S. may establish postal and commissary facilities, which on request of Greenland authorities may also serve the native population.

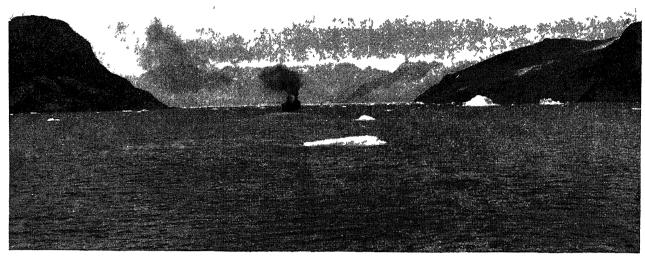

Art. 8. All materials brought in for the construction and use of the defense establishment shall be free of customs duties or other taxation; the personnel and their families shall be exempt from all forms of taxation or levies by the Danish authorities in Greenland.

Art. 9. The U.S. will respect all legitimate laws and customs of the native population and the Greenland administration.

Art. 10. The Agreement shall remain in force until it is agreed that the present dangers to the peace and security of the American continent have passed. At that time the modification or termination of the Agreement shall be the subject of consultation between the government of the U.S. and the government of Denmark. After consultation either party may give notice of termination, which shall take effect 12 months after such notice.

The agreement was entered into after consultation with the democratically elected councils of Greenland. Virtually, the United States had established a temporary protectorate over Greenland. The Germans protested and the nazi-controlled government of Denmark voided the agreement and recalled the minister. But De Kauffmann stayed on in Washington. He admitted that he had acted without orders, only "in the interests of the king of Denmark," and that the government knew nothing of the agreement until it was a fait accompli. He stated that he had come to the U.S. to represent his king and a free people, and that that was what he was continuing to do. The significant fact was that the United States and a "free Dane" official had made a far-reaching decision.

Minor War Operations.-One of the small but important actions of the war took place in 1943 off Greenland's east coast, where for the second time in two years a German weather station was demolished. When a U.S. army sledge patrol spotted this new nazi base on an island off the coast the Germans knew they would be attacked. The nazis captured two of the patrol, however, and killed the third man. Then they attacked a hunting and weather station to the north operated by Danes, most of whom escaped in the darkness. One, made prisoner, was forced to guide the German lieutenant on an exploring trip; he watched for an opportunity, overpowered the nazi, and after a 40-day sledge trip handed him over to army custody. Two U.S. coast guard cutters forced their way slowly through the ice toward the base, and planes bombed the installations as early as May. The bombings

First U.S. occupation forces entering a fjord in Greenland early in July 1941, three months after President Roosevelt announced American protectorate over the island in April 1941

destroyed all but one of the carefully built structures of the post, and sank the German supply ship. When the coast guard force arrived no Germans were left, though at other points the Americans took two prisoners. Presumably the rest of the force had been evacuated by plane.

Again in 1944 the value of Greenland as a weather reporting station was signalized. The persistent nazis had come back with increased forces, and with equipment for long occupation. In the late summer and early fall of 1944, Danish patrols discovered, and U.S. army combat groups destroyed, German shore installations and the U.S. coast guard attacked German ships and forces. Nearby, off Cape Sussi, a nazi trawler was discovered gutted by fire; here were indications that the garrison had been supplied by parachute. A month later the two U.S. ships engaged in this operation (the "Northland" and the "Storis") chased another trawler for 70 mi. through the ice and captured the crew after they had scuttled their vessel, and after a German plane (perhaps from Norway) had failed in its attack on the Americans. Sailors from the "Eastwind" destroyed a German radio-weather station on Little Koldewey Island, near the north pole. With the aid of a scout plane, the "Eastwind" and "Southwind" then found and brought to bay another German trawler, the "Externsteine," and this time captured her intact and brought the ship to Boston, Mass. In these various operations about 60 Germans were captured.

It was obvious that only eternal vigilance would keep the Germans away from the area which was regarded as the key to the weather of the North Atlantic and even of continental Europe.

The agreement of 1941 between Secretary of State Cordell Hull and Minister Henrik de Kauffman had of course been undertaken without Danish governmental sanction, and had been declared void by the Germans. Immediately upon liberation, therefore, the Danish cabinet and a few days later the Rigsdag (parliament) ratified the four-year old document by unanimous vote in both houses (May 16, 1945). Foreign Minister Christmas Moeller spoke of the treaty as "President Roosevelt's handshake with Denmark." In Oct. 1945 it was announced that the army air forces weather service would give four of its

Greenland stations to Denmark. The loyalty and interest of the Greenlanders was indicated by their gift of 40,000 Kr. (about \$10,000) to the British in 1942 to aid in the liberation of the Danish motherland. Already, in July 1945, the "Disko," first ship direct from Denmark since 1940, had arrived in the colony amid great rejoicing. Reconversion was proceeding.

In the summer of 1946 a small fleet of three U.S. navy and coast guard ships penetrated the Arctic ice floes into the far northern port of Thule, on Smith sound above Baffin bay—only 950 mi. from the north pole. It was a training and weather research expedition, composed of icebreakers and a seaplane tender, commanded by Capt. Richard H. Cruzen, who had been second in command with Admiral Byrd in the antarctic 1939—41.

				(G. A. Ro.)

Greenwood, Arthur

Greenwood (1881-), British politician, was born in Yorkshire, England. He attended University college in Leeds, subsequently becoming a lecturer in economics there. In 1917 David Lloyd George appointed Greenwood assistant secretary of the reconstruction committee and in the same year made him one of the secretaries at the ministry of reconstruction. He joined the Labour party in 1920 and was elected to parliament in 1922. In the Ramsay MacDonald government of 1929, Greenwood was minister of health and also a privy councillor. He lost his parliamentary seat in the general elections of 1931, but was returned during a by-election the following year. Upon formation of the wartime coalition cabinet in 1940, Winston Churchill appointed Greenwood minister without portfolio; he held this post until 1942. He returned to the government, July 27, 1945, as lord privy seal in the Clement Attlee cabinet. The following month, quieting fears that the new Labour government would dislocate British economy with too rapid socialization, Greenwood declared that in spite of its long-range plans for socialization the government would consult and enlist private enterprise for immediate critical necessities.

Grenada

See WEST INDIES, BRITISH.

Grew, Joseph Clark

Grew (1880-), U.S. diplomat, was born May 27, 1880, in Boston, Mass., son of a banker. He was graduated from Harvard university in 1902 and after a period of travel in the far east, entered the U.S. foreign service. He held a number of minor posts in Cairo, Mexico City, St. Petersburg (Leningrad) and Berlin. After World War I he was made envoy extraordinary to Denmark in 1920 and to Switzerland in 1921.

Grew represented the United States at the Conference on Near Eastern Affairs at Lausanne, Switzerland, 1922–23, and negotiated a treaty with Turkey in 1923. The following year, he was named undersecretary of state. His next appointment was that of ambassador to Turkey in 1927, a post he held until 1932, when his appointment as ambassador to Japan was announced by President Herbert Hoover.

Generally, Grew was friendly and conciliatory in his relations with the Japanese and took the stand that all questions between the Japanese and the United States could be settled amicably. Disturbed by Japanese encroachments in China and the far east, however, he warned the Tokyo government in 1939 of U.S. resentment over Japanese methods. As early as Jan. 1941 he cabled the state department that Japan had plans for a "surprise mass attack at Pearl Harbor in case of 'trouble' with the United States."

After this attack occurred in Dec. 1941, Grew and his staff were interned in Tokyo and returned to the United States on the exchange ship "Gripsholm" in the summer of 1942. He was reappointed undersecretary of state Dec. 20, 1944, amid controversy that arose over his attitude

that the emperor of Japan could be retained on the throne and have his uses. He resigned as undersecretary of state on Aug. 16, 1945.

Griffin, Bernard William

Cardinal Griffin (1899-), archbishop of Westminster, was born at Birmingham, England, on Feb. 21, 1899. Educated at Cotton and Ascott colleges, he interrupted his studies at the age of 19 to enlist in the royal air force. He returned to school after World War I, was ordained at 25, and continued his studies at the English and Beda college in Rome. Back in England, he became secretary to Archbishop McIntyre of Birmingham, and later to Archbishop Williams, whose auxiliary he became in 1938. He had been chancellor of the archdiocese from 1929 to 1938. At the age of 44 he was named Archbishop of Westminster, succeeding Cardinal Hinsley. His jurisdiction as ordinary of the see extended over much the same area as that of the bishop of London. As chief metropolitan, he occupied a position similar to that of the archbishop of Canterbury before the Reformationprimate of all England.

During World War II he urged a just and lasting peace. He was the first member of the foreign hierarchy to visit Germany upon the cessation of hostilities; he congratulated the German bishops on their splendid resistance to the Nazis. His outspoken criticism of Russian domination of the provisional Polish government provoked the protests of the Russian press. Archbishop Griffin was proclaimed cardinal by Pope Pius XII on Feb. 18, 1946.

Grindstones

See ABRASIVES.

Gromyko, Andrei A.

Gromyko (1909—), Russian diplomat, was born July 5, 1909, in the village of Stayre Gromyki in the Gomel region of Russia. After graduation from the Minsk Institute of Agricultural Economics in 1934, he became a member of the scientific staff of the Institute of Economics of the Academy of Science of the U.S.S.R. He remained in this academic post until May 1939, when he was appointed chief of the division of American countries in the People's Commissariat of Foreign Affairs. A few months later he resigned to become counsellor of the U.S.S.R. embassy in Washington. He served in this capacity under Ambassador Constantine Oumansky until 1941, then under Ambassador Maxim Litvinov.

When Litvinov was recalled from Washington in Aug. 1943 as an expression of soviet displeasure at the failure of the U.S. to open a second front in the European war, Gromyko succeeded him as Russian ambassador to the U.S. and also to Cuba. In Aug. 1944 Ambassador Gromyko headed the soviet delegation at the Dumbarton Oaks conference. He also attended the San Francisco conference (April-June 1945) that drew up the United Nations charter, and became chief of the Russian delegation after Vyacheslav M. Molotov, the soviet foreign commissar, returned to Moscow. As the chief soviet delegate to the United Nations organization, he attended the opening session of the general assembly in London on Jan. 10, 1946. He was also named Russian representative on the Far Eastern commission. One of the most significant and dramatic events in the opening session of United Nations Security council occurred when Gromyko walked out of the council session after rejection of the Russian

proposal for postponement of the Iranian question; he was absent from the council from March 27 to April 4, 1946. One week later he was relieved of his post as ambassador in order to devote all his time as the permanent soviet representative to the council.

Groves, Leslie Richard

Gen. Groves (1896—), U.S. army officer, was born Aug. 17, 1896, in Albany, N.Y. He studied at the University of Washington, Seattle (1913–14), the Massachusetts Institute of Technology, Cambridge (1914–16) and entered the U.S. Military academy at West Point, N.Y., graduating in 1918. Commissioned a second lieutenant in the engineers corps, he served with the A.E.F. in France for a three-month period in 1919. On returning to the United States, he studied at the Army Engineer school, Camp Humphreys, Va., in 1921.

After a number of assignments abroad he enrolled in the Command and General Staff school, graduating in 1936. He was also graduated from the Army War college in 1939. In Nov. 1940, he was raised to the temporary rank of a colonel and later became deputy chief of army construction.

Groves was promoted to the rank of brigadier general in 1942; the same year he was made head of a new war department division, called the Manhattan Engineer district. Until the first atomic bomb was dropped on Hiroshima, Aug. 6, 1945, the "district" operated under strictest secrecy; on that date it was disclosed that the Manhattan project, under Groves' supervision, had directed production of the atomic missile.

Groves, whose temporary rank was major general in 1945, was appointed assistant to the army chief of engineers, and on Dec. 29, 1945, the army and navy created a joint advisory board to work with Groves on the atomic board project. Ten days later (Jan. 7, 1946) Secretary of State James Byrnes named Groves to a newly created five-man committee whose task it was to study atomic controls and to "fully protect" U.S. atomic interests.

Groza, Petru

Groza (? —), Rumanian politician, was a Transylvanian landowner before he entered politics. After Rumania's liberation from the German armies in the late summer of 1944, Groza became vice-premier in Gen. Nikolai Radescu's cabinet. After Radescu had been forced out by soviet authorities Groza, head of the left-wing National Democratic front, became premier (March 6, 1945).

One of Groza's first actions was to ask Premier Joseph Stalin for the return of Transylvania to Rumania; Stalin promptly granted this request. On March 15, 1945, Groza emphasized that no Transylvanian population exchange with Hungary was envisaged because that would be a "fascist solution." In domestic affairs Groza pushed through enactment of agrarian reforms, which included expropriation of property of *Volksdeutsch* and war criminals. Church and crown property were exempted from the decree.

The political opposition, meanwhile, charged that Groza was ruling by terrorism, that freedom of the press was forbidden and that the opposition was not permitted to have a voice in the government. In order to correct this lack of political "balance," the three-power Moscow agreement signed by Ernest Bevin, James F. Byrnes and Vyacheslav Molotov in Dec. 1945 provided that the Rumanian govern-

ment was to be broadened by inclusion of opposition members. However, the U.S., Britain and Rumanian oppositionists later charged that Groza's government, far from relaxing its restrictive measures against other parties, was tightening its control through the agency of the National-Democratic front, allegedly under control of Rumanian communists. In the elections of Nov. 1946, the Groza government bloc won an overwhelming majority of seats in the one-chamber parliament. The opposition claimed that the elections were fraudulent.

Guam

The discovery of Guam by Magellan on March 6, 1521 and its cession to the United States at the end of the war with Spain by the Treaty of Paris on Dec. 12, 1898, were both significant events. Yet there was perhaps no period in the history of this small island of approximately 210 sq.mi. more eventful than the decade 1937–46.

Prior to World War II, relatively little was generally known about Guam. It was considered a lonely naval outpost and was thought of primarily in connection with the almost continuous congressional debate as to whether the island was to be "fortified." The misconceptions relating to the bill to "fortify" Guam were characteristic of the vague general impressions in relation to the island, as the controversial "fortification" bill was to authorize nothing more than the dredging of Apra harbour.

The effect of the Pacific war on Guam was immediate. The Japanese forces occupied the island on December 12, 1941 and administered it under military government until the U.S. forces began the reoccupation of the island on July 20, 1944.

Since Guam, despite its approximate 30-mi. length and average of 7-mi. width, was the most sizable land area in the north latitudes between Hawaii and the Philippine Islands, it was destined to be used as an advance base for further operations against Japan and the Japanese forces.

In the midst of almost complete destruction, Guam was immediately converted into a U.S. base of enormous proportions. Within a very short time after its liberation, numerous airfields had been constructed, harbours had been dredged out, whole towns and villages had been relocated, a completely new network of roads had been constructed and an almost unlimited amount of supplies had begun to flow into the island.

From the time of the liberation of Guam until the final surrender of Japan, the island was used as a major base of military operations. It was from Guam that the commander in chief of the Pacific fleet and Pacific Ocean areas mounted and directed operations in the later stages of the war in the Pacific.

The impact of the war profoundly affected the life of every one of the approximately 23,000 Guamanians living on the island. The devastation incident to hostilities completely demolished most of the towns and villages, and all forms of agriculture and business were for the most part destroyed.

In order to alleviate the conditions imposed by the war, congress, upon cessation of hostilities, enacted a bill to compensate the residents of Guam for deaths, personal injuries and private property damages incident to these hostilities. A city planning commission was set up to assist in

the rebuilding and re-establishment of the towns and villages in accordance with modern principles of construction, comfort, convenience and economic utility. In addition, an appropriation was made by congress for the rebuilding and restoring of public facilities in the various towns and villages destroyed during the war.

In addition to this physical change, the gradual modification in the culture and economy of Guam before World War II was given an immediate impetus by the Japanese occupation of the island and the subsequent reoccupation by large numbers of U.S. military personnel.

This modification was particularly notable in the economy of the island. Prior to the war, copra production was the principal industry of Guam. It accounted for the greater portion of the export trade. During the war, the coconut plantations were in great part destroyed. While efforts were made to recultivate and replant the coconut groves, agricultural recovery was not very rapid in the immediate postwar period. The labour supply was engaged in the reconstruction of destroyed homes and towns and in activities relating to the military establishments, where more remunerative employment could be secured.

Efforts were made to diversify the postwar economy of Guam by the inauguration of an experimental farm and the introduction of animal husbandry projects. A soap factory was established, and various wholesale and retail establishments were reopened. Yet the largest and the most remunerative employers on Guam were the military establishments.

Significant developments also took place in education. A program of vocational training was inaugurated in order to assist in adaptation of local inhabitants to the changed economy of the island. It was largely oriented around the subjects of gasoline motors, electricity and electrical appliances, plumbing and other mechanical trades necessary to life in a modern city and employment in military establishments

Opportunities for higher education were expanded. A new school for native medical practitioners offered a four-year course in general medicine. Similarly, a school of dentistry was established. Both schools were open to students from Guam and other islands in the Pacific, including the former Japanese-mandated Marianas, Marshall and Caroline Islands. Scholarships to educational institutions in the United States were also made available to a limited number of Guamanians.

Conditions imposed by the war thus contributed to accelerate greatly the gradual process of cultural assimilation, the totality of which was now almost inevitable. (See also Marianas Islands.)

Guatemala

The northernmost Central American republic, Guatemala is bounded by Mexico, British Honduras, the Caribbean sea, Honduras, El Salvador and the Pacific ocean. Area: 42,353 sq.mi., technically in doubt because of a boundary dispute nominally existing between Guatemala and British Honduras. Pop. (1943 official est.), 3,450,732; the pop. by the census of 1940 was 3,283,209; other official pop. ests. were: 1938, 3,044,490; 1941, 3,384,270. Racial distribution was estimated to be at least 60% Indian, approximately 30% mestizo and less than 5% white; Guatemala is the most heavily Indian of all the Central American republics. The population is most densely settled in the highland regions near the Pacific side; pop. density was estimated in 1943 to be 82.07 per sq.mi. The capital is Guatemala City (pop. est. Jan. 1, 1946, 185,896); other cities (with 1946 pop. ests.) include Zacapa (53,262), Escuintla (47,444), Quezaltenango (45,711), Jalapa (45,174), Cobán (44,165), Coatepeque (26,733), Puerto Barrios (26,-003), Antigua (22,839); these figures in some cases showed very large increases over the census figures of 1940 and in such instances were probably open to question.

The constitution of March 11, 1945, established a unitary government with an executive branch headed by a president chosen by popular election for a 6-year term and ineligible for 12 years thereafter, a council of ministers of state under partial responsibility to the legislative branch, a unicameral congress and a judiciary headed by a supreme court of justice, the members elected by the congress. The constitution included an extensive bill of rights and attempted by elaborate provisions to prevent any return of presidential domination or dictatorship. Presidents during the decade 1937-46 included Gen. Jorge Ubico (1931-July 1, 1944); Gen. Federico Ponce (July 4-Oct. 20, 1944); a revolutionary junta composed of Maj. Francisco Javier Arana, Capt. Jacobo Arbenz and Jorge Toriello (Oct. 20, 1944-March 15, 1945); Dr. Juan José Arévalo (after the latter date).

Ubico's "Continuismo."—Gen. Jorge Ubico, generally recognized as the strongest of the various Central American dictators of the 1930s, began a second six-year term as president of Guatemala on Feb. 15, 1937, his term having been extended in July 1935 to March 15, 1943. In compliance with his famous ley de probidad, which he wrote into the Guatemalan constitution as well as into statute and which required all office holders to file sworn statements of personal assets upon entering and leaving office, he took occasion to make public a statement of his own and his wife's personal fortunes and incomes. Guatemala and El Salvador signed a treaty on April 9, 1938, defining their mutual boundary, thus ending satisfactorily a controversy of long standing.

Conditions in Guatemala continued quiet in 1939, but with a significant growth of anti-foreign sentiment. In March the government placed severe restrictions on business activities conducted by foreigners and tightened immigration laws in order to reduce foreign control of commerce. All foreign political groups were ordered dissolved in May, and the government in October issued formal warnings to German radio officials to confine their broadcasts in Guatemala to the truth. The number of Germans in Guatemala was not large (estimated at 1,500 Germans

and 2,200 citizens of German descent), but their thorough group organization and aggressiveness caused increasing concern to the government.

Also in 1939, Guatemala revived a long-dormant boundary controversy with Great Britain over the border with British Honduras. The controversy dated back to a treaty between Guatemala and Great Britain in 1859 in which the former government agreed to recognize the existing boundaries of British Honduras in return for British assistance in constructing a road from Guatemala City to the Caribbean. Guatemala now claimed that Great Britain had failed to comply with that provision, thus invalidating the treaty, and that Guatemala was hence entitled to its former claim of some two-fifths of the territory of southern British Honduras.

Fear that began to crystallize in 1940 that Guatemala might be used as a centre for the dissemination of German propaganda throughout Central America resulted in the development of closer relations between Guatemala and the other American republics. The economically influential German minority in Guatemala controlled about 55% of the country's coffee plantations and 60% of the coffee acreage, as well as many business firms in Guatemala City and elsewhere. Two presidential decrees in 1939 barred the nazi party and nazi propaganda from Guatemala, and, as a further precaution, the cities were patrolled by armed soldiers and the rural areas by motorcycle police. The government forbade meetings by political parties. Great Britain in Jan. 1940 formally offered to submit to arbitration the question of the disputed British Honduran boundary, but no immediate steps were taken by either side. When the problem of the possible collective attitude of the New World republics toward an expected attempt on the part of Germany to gain control of French, Dutch and perhaps British possessions in Middle America was discussed at the second inter-American foreign ministers' conference at Havana, Cuba, in July 1940, Guatemala concurred in the proposal for "provisional administration" over such colonies but made an exception with regard to British Honduras because of her dispute over that territory.

A constitutional assembly at Guatemala City in Sept. 1941 was responsible for another example of continuismo by extending Pres. Ubico's term to March 15, 1949. The chief problems of 1941, however, were those related to the war and hemispheric defense. War preparedness measures included strict licensing of strategic mineral exports, establishment of a school of modern military tactics, deportation of the Guatemalan correspondent of the nazi Transocean news agency, expulsion of German consuls and withdrawal of Guatemalan consuls from Germany and, as a climax, declarations of war on Japan on Dec. 7 and on Germany and Italy on Dec. 11. The United States' blacklist of axis firms in Latin America resulted in a boycott of German business, especially of coffee producers. The government froze funds of the German-owned coffee plantations. The dispute with British Honduras remained technically alive, although Guatemala announced in 1941 that it would not press its claim for the duration of the

The policy of co-operation with the inter-American war effort continued during 1942. The government took over axis properties and levied a special tax on them for defense purposes. Coffee plantations owned by axis nationals were continued in operation, in order to maintain production at proper levels, but placed under the direction of the Central Bank of Guatemala. Pres. Ubico decreed the

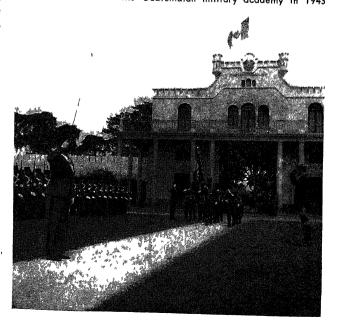

establishment of a civil guard, composed of men from 50 to 60 years of age, to combat subversive activities. One of Latin America's largest military airports was built in Guatemala, and United States patrol bombers operated from it. The government also ordered all importation of United States currency ended in order to prevent its use by axis agents. Shortages of consumer goods were serious, because of lack of shipping, although this was slightly remedied by completion of a bridge in Feb. 1942 over the Suchiate river, thus affording much better railway connections with Mexico. The government early in the year froze gasoline and tire stocks and began rationing them in July. Price ceilings on some imported articles were set, and rent controls were instituted in May.

Guatemalan conditions continued relatively quiet in 1943, with little change in policies. The chief effects of the war were felt in rising living costs, estimated at as much as 40% above 1941; the increase was explained by the augmented income from a profitable coffee year and the export of foodstuffs to the Canal Zone, as well as by the diminishing supply of consumer goods. Various regulatory controls remained in effect, such as the freezing of rents and certain imported items, gasoline rationing, prohibition of the export of cattle and some other products and a moratorium on car payments.

Fall of Ubico.-The year 1944 proved to be one of the most turbulent in later Guatemalan history. A successful general strike directed in May against the dictatorpresident of neighboring El Salvador, Gen. Maximiliano Hernández Martínez, produced a state of nervous anticipation in Guatemala. Pres. Ubico tried certain steps, such as expropriation of German-owned property on June 24, to try to stave off an explosion, but without notable success. Demands for reform presented by university students were met by a suspension of certain constitutional guarantees. This resulted almost spontaneously in a general strike, and conditions were highly critical late in June. Ubico on June 28 paid off two important items of the foreign debt, \$1,316,000 in dollar bonds and the sterling debt of £1,520,432. Despite a seeming betterment in the political crisis he suddenly withdrew from the presidency on July 1.

A military junta succeeded immediately to power and on July 4, 1944, Gen. Federico Ponce, one of the junta mem-

Cadets on review at the Guatemalan military academy in 1943

bers, was elected provisional president. Ponce on July 11 set presidential elections for mid-December. Some other reforms followed, but the impression gained ground that Ponce was another potential dictator and would perpetuate himself in power. The principal early candidates for the presidency were Adrián Recinos, recently resigned as ambassador to the United States, and Dr. Juan José Arévalo, for many years a voluntary exile in Argentina. The party organization and newspaper which had represented Ubico still continued in a favoured position and Ubico himself, who had remained in Guatemala City, was of continuing influence. The political pattern was basically a conflict between civilian and military elements.

Growing suspicion of Ponce led to a conspiracy in October between civilian elements and young army officers to overthrow the government. It came to a head in a bloody revolt on Oct. 20, 1944, led by a junta consisting of Maj. Francisco Arana, Capt. Jacobo Arbenz, and a civilian, Jorge Toriello. After several hours of vigorous fighting and dramatic negotiating, Ponce and his cabinet resigned, later going to Mexico. The junta took prompt and energetic steps to reform the government and from the beginning had widespread popular support; it received diplomatic recognition after a short trial period, To institute a more democratic government, successive elections were held for a new legislative assembly (Nov. 3-5), a president (Dec. 17-19), a constituent assembly to draft a new constitution (Dec. 28-30) and municipal officials (Jan. 7, 1945). The presidential elections attracted more attention than any of the others and proved to be a landslide for Dr. Arévalo, who won with 256,514 votes to 20,550 for his next closest opponent. By action in June and again on Aug. 14, the government expropriated various types of axis-owned property. Guatemala signed two agreements with the United States in September, one for completion of the Guatemalan section of the inter-American highway, the other for control of typhus and malaria. Work on a military highway through Guatemala and other Central American states, undertaken by U.S. army engineers, had been suspended the preceding year, and Guatemala was later given \$1,500,000 worth of equipment in lieu of the completion of a section of the roadway to the Mexican border. Guatemala modified its Chinese exclusion law in April 1944 by changing to a quota system. On May 3 it partially reopened the dispute over the British Honduran boundary by its announcement that it would expect the United States to use its good offices to bring about a settlement of the problem.

The constituent assembly opened its sessions Jan. 10, 1945, and in the short time of two months completed its work, in time for the inauguration of Dr. Arévalo on March 15. On Jan. 23 the revolutionary junta demanded that former Pres. Jorge Ubico return to the treasury a "bonus" of \$200,000 paid him by the national assembly in 1940; the demands against Ubico were later raised to a total of \$587,000. As the former president failed to take action within the 30 days granted him, the government took steps to confiscate his Guatemalan properties, The government on Feb. 11 arrested eight opposition leaders, including officials of Adrián Recinos' Democratic party, and at the same time it "invited" Recinos to leave the country; all of the persons were either charged with or suspected of conspiracy. Pres. Arévalo on his inauguration in March appointed three members of the former revolutionary cabinet to his own cabinet; Jorge Toriello, the forceful civilian member of the revolutionary junta, was subsequently named by Arévalo to the key post of finance minister. The government in April 1945, less than 30 days

after Arévalo's inauguration, suspended constitutional guarantees for one month, because of a "reactionary conspiracy," and developments later in 1945 indicated that authorities were assuming an increasingly severe attitude toward the political opposition. Further activities by opposition parties were banned on June 19 and in that month and July numerous persons were exiled. The government again suspended constitutional guarantees late in October, with the state of siege (martial law) lasting 60 days and with some 60 persons taken into custody.

On Feb. 21, 1945, the government expropriated a Pan American Airways subsidiary, Aerovías de Guatemala, and later reorganized it on a nationalized basis under the name of Aviateca. Other nationalistic and similar actions and legislation followed. On April 21 an economic emergency law was passed which penalized speculation in essential goods and authorized control of rents, prices, wages and imports. In May the government began preparation of a comprehensive labour code and also of laws promoting co-operatives. A law of May 22 revised regulations regarding agricultural labour. A labour congress met in August and the national labour organization, in accordance with action by the congress, joined the Confederation of Latin American Workers (C.T.A.L.).

Postwar Foreign Relations.-The most significant development of 1945 in the field of foreign affairs was probably the changed relation with Spain. Guatemala broke diplomatic relations with the Francisco Franco regime on Jan. 23 and was thus the first American government to take this action (Mexico had never established relations with Franco). The Guatemalan government on Sept. 10 extended diplomatic recognition to the Spanish "government-in-exile" established at Mexico City. On Feb. 28, the Guatemalan delegation at the inter-American conference at Mexico City proposed that "undemocratic" regimes should not be recognized. An exchange of notes at Washington, D.C., on April 19 established diplomatic relations between Guatemala and the soviet union. The boundary controversy with British Honduras resulted in further diplomatic correspondence during 1945. Guatemala approved the United Nations charter on Oct. 12 and the Bretton Woods monetary agreement on Dec. 28. Relations with El Salvador, which had been very strained during the tenure of the revolutionary junta in Guatemala and a harsh dictatorship in El Salvador, were improved after recognition by Guatemala of a new government in El Salvador in April. A Guatemalan railway embargo on transportation to El Salvador, imposed late in 1944, was lifted early the following year and during the summer of 1945 the presidents of the two countries met on the common border to discuss steps looking to the union of the two republics as a forerunner to Central American union. Guatemala signed an agreement with the United States on May 22 providing for a military mission to be sent to Guatemala; several technical advisers were sent from Washington in August to aid in solution of problems of price control, finance, and reform of statistical methods. The United States revealed in October that Guatemala had received, under the terms of a lend-lease agreement of Nov. 16, 1942, goods valued at \$21,089,000, an amount exceeded among the American republics only by Brazil. The Guatemalan government on Dec. 14 gave a printing plant, formerly owned by the German legation at Guatemala City, to the University of San Carlos.

Pres. Arévalo was seriously injured in an automobile accident on Dec. 16, 1945, but was able to resume his duties

after a few weeks. Policy differences between him and Finance Minister Jorge Toriello led to removal of the latter on Jan. 11, 1946. A congressional investigation of the nationalized Aviateca air line later in 1946 revealed Enrique Toriello, brother of the ousted finance minister, to be the chief stockholder as well as president, and showed that most of the rest of the stock in the profitable airline was held by Maj. Arana, former membér of the revolutionary junta. A contest for control appeared to be shaping up, complicated by the distribution by Toriello and Arana of a portion of their stock among a number of army officers in order to win their support. The Salvadorian supreme court on Jan. 27 refused a Guatemalan request for the extradition of José González Campos, finance minister

under Ubico. Dr. José Gustavo Guerrero, Salvadorian statesman and president of the Permanent Court of International Justice, was host to Pres. Arévalo and the other four Central American presidents at a unique meeting at his home in Santa Ana, El Salvador, on Sept. 12, 1946, in which agreement was reached for the establishment of a commission to study methods of bringing about a union of the five Central American republics; previous discussions had taken place largely between Guatemalan and Salvadorian officials only.

The Guatemalan government on Dec. 11, 1945 established the Bank of Guatemala to serve as a partial fiscal agent for the government. On Feb. 18, 1946, the office of price control, created July 1, 1945 to attempt to combat inflation, was abolished. The congress, late in July 1946, passed a law requiring that 85% of the pay rolls of Guatemalan firms must go to nationals; this modified a decree of Feb. 25, 1945 which had set the figure at 75%.

Guderian, Heinz

Guderian (1886—), German army officer, was schooled in a military academy and entered the army in 1906. During World War I he rose to the rank of captain. He was attached to the ministry of war in 1919, and became a major in 1927, and a lieutenant colonel in 1931. In 1933 Guderian assumed command of the Black Drivers' unit, Germany's first regular tank corps, and in 1935 he was given command of all German tank troops.

He was promoted to the rank of major general the following year. His textbook, Look Out, Tanks, summarizing the basic principles of tank warfare, was published in 1939. Guderian led German occupation troops into Austria in 1938 and gained fame with his drive into Poland in 1939. In July 1944, following an attempt on Hitler's life, he was appointed chief of the army general staff, replacing Col. Gen. Alfred Jodl. From Oct. 1944 to March 1945 he was commander in chief of the nazi armies in the east and unsuccessfully attempted to halt the Russian advance.

Guerrilla Warfare

Few could foresee the part that guerrilla warfare and guerrilla tactics applied to ordinary warfare were to play in World War II. Yet, in the event, irregular forces, and regular forces using the methods of irregulars, scored success after success in almost every theatre of war. The reason for this lay in the presence, to a greater or lesser degree in most theatres, of the conditions essential to the successful conduct of guerrilla warfare, namely, an enemy strategically on the offensive but tactically often forced by circumstances on to the defensive. The German conquests in Europe and the Japanese conquests in southeast Asia were in many cases too rapid and on too vast a scale to make possible the complete occupation and proper policing of the territories conquered. In some places, only the key points and lines of communication connecting them could be firmly held, and the intervening areas had to be left to the care of isolated patrols or garrisoned by local "quisling" troops of doubtful quality. Meanwhile, the enemy's fighting troops were once again rushed into the line to play their part in fresh fighting and fresh conquests.

Thus the first essentials of guerrilla warfare were present, namely, a potential field of operations and abundant targets in the shape of the enemy's numerous garrisons, installations and long-drawn-out lines of communication.

The remaining aids to resistance, namely, a friendly population, natural cover and, above all, sources of supply, internal or external, occurred in varying degrees in the various countries concerned, and, according to the opportunities offered, the operations varied in scale from isolated acts of sabotage in some countries to full-scale campaigns in others.

Perhaps, too, there was a deeper and more fundamental reason for the recurrence of the guerrilla motive in this war. Just as World War I was essentially a war of position, so World War II was essentially a war of movement—movement on land, in the air and on the sea. The essential characteristic of the guerrilla being his mobility, it was only natural that he should have taken his place as a weapon beside the mosquito plane, the motor torpedo boat, the light tank and the paratrooper.

In a sense the Germans themselves may be said to have given a lead to the other belligerents in methods of irregular warfare, which later were turned against them to good effect. The "fifth columns" of nazi or fascist sympathizers, armed or trained in gangster tactics, who in so many countries emerged at the critical moment and took the loyal defenders in the rear, were, in the first place, a German invention. Parachute troops, too, which were first employed operationally by the Germans, had much of the guerrilla about them. Like guerrillas, they relied on a high degree of dash and initiative, on surprise and on their extreme mobility; for supplies they depended on what they could carry with them and on what they could seize from the enemy. If they were to live at all, they had to live on the enemy and on the country in which they were operating.

But all irregular warfare is not guerrilla warfare. The

Russian guerrillas, tracked down in a wheat field by German troops in the summer of 1941, and promptly executed. The disabled tank at the right is Russian true guerrilla is not a regular soldier, fighting far from his home, but a native of the country in which he is fighting, who has spontaneously taken up arms against the foreign invader or oppressor. The word "guerrilla," which literally means "little war," is Spanish in origin, and there could be no better example of guerrilla warfare than that which was waged so mercilessly and so successfully by the people of Spain against the troops of Napoleon, an example which was to be followed by their descendants more than a century later when they took to the hills in a despairing attempt to rid their country of General Francisco Franco and of his German and Italian allies.

African Operations.-In the different countries overrun by Germany, Italy and Japan circumstances favoured guerrilla warfare to a varying extent. As it happened, the first country to be overrun by the fascist dictators, Ethiopia, was the first to be liberated, and, in the liberation, Ethiopian guerrillas, glad of an opportunity to revenge themselves on their Italian oppressors, played a not inconsiderable part. In Libya, too, the Italians paid dearly for the atrocities which they had committed against the native population. The Arabs did not, it is true, take any very active part in the actual hostilities against the Italians. All organized resistance to Italian rule in Libva had long since been brutally crushed. But their hatred of the Italians was such that, despite savage reprisals, they were still ready to do everything in their power to help British forces operating behind the Italian lines.

Here it was that the author had his first experience of guerrilla warfare in 1942, during the operations of the Special Air Service regiment and Long-Range Desert group in Cyrenaica. The opportunities for such operations were immense. In the first place the British had the desert.

This provided an ideal background, a medium as essential to this kind of operations as the sea to naval operations, or the air to the operations of the royal air force. The Special Air Service regiment, as its name indicated, was originally formed and trained as a parachute unit, and indeed, at a later stage in the war, carried out many successful parachute operations. But it very soon became clear that in desert warfare there was no need for parachutes in order to reach a target behind the enemy lines. At that time the axis front line was in the neighbourhood of Sollum, on the frontier of Egypt and Libya, whence it was to advance during the months that followed as far as El Alamein. But throughout the Libyan campaign, the fighting necessarily followed the line of sea and land communications up and down the length of the coastal belt, and, properly speaking, the axis lines did not extend very far to the south, where they relied on natural obstacles such as the sand and the Qattara depression to protect their right flank. In order, therefore, to reach a destination behind the axis lines, all that was necessary for a small mobile raiding party was to penetrate sufficiently far south and then to make its way westward, unhindered and unobserved, to its destination. What is more, the whole journey could be made by motor vehicle, which, as a means of transport, possessed numerous obvious advantages over the parachute, and, notably, made the return journey less of an uncertainty. Thus, the desert furnished the lines of approach and withdrawal. It also gave cover, cover so good as to provide a temporary base.

Five hundred miles behind the axis lines, on the southern fringe of the coastal belt and dominating the town of Bengasi, with its harbour and system of operational aerodromes, lay the Gebel Akdar, a range of hills, partly pasture and partly desert. The broken and scrubcovered surface of the hills provided excellent cover for small forces. Moreover, the Gebel was inhabited by a branch of the fanatically anti-Italian tribe of the Senussi, who were willing to provide the British with guides, local intelligence and occasional food. For other supplies the British relied in the main on what they carried with them and on prearranged dumps. Apart from the Gebel, almost any stretch of the desert (which is geographically much more varied than is generally realized) provided some cover which could be supplemented by the skilful use of camouflage, a most necessary art under such conditions.

Such was the scene of operations. There was no lack of suitable objectives. All the way from Bengasi to the Egyptian frontier, the whole length of the axis's extended and inadequately guarded lines of communication, airfields, gasoline and ammunition dumps, motor transport parks and installations of all kinds offered the most tempting targets to suitably equipped raiding parties, operating either on foot or in specially armoured jeeps. The raiders made their attacks at night, either blowing up their targets with charges of high explosive or shooting them up with automatic weapons and then withdrawing under cover of darkness to hiding places in the neighbouring desert, whence they could make further sorties against fresh targets. These tactics, developed by Colonel David Stirling and Colonel Paddy Mayne of the S.A.S. regiment, and supported by the superb navigation and unrivalled knowledge of the western desert furnished by the Long-Range Desert group, produced remarkable results (including the destruction on the ground of several hundred axis aircraft), which were out of all proportion to the manpower and resources expended. Moreover,

these raids served to divert from the front considerable numbers of aircraft and armoured vehicles as well as infantry, which would otherwise have been employed in the main battle. Whether or not these units could properly be described as guerrilla formations, their operations, relying as they did for success on surprise and mobility, on striking power and the intelligent use of background, provided a perfect illustration of guerrilla principles applied to desert warfare.

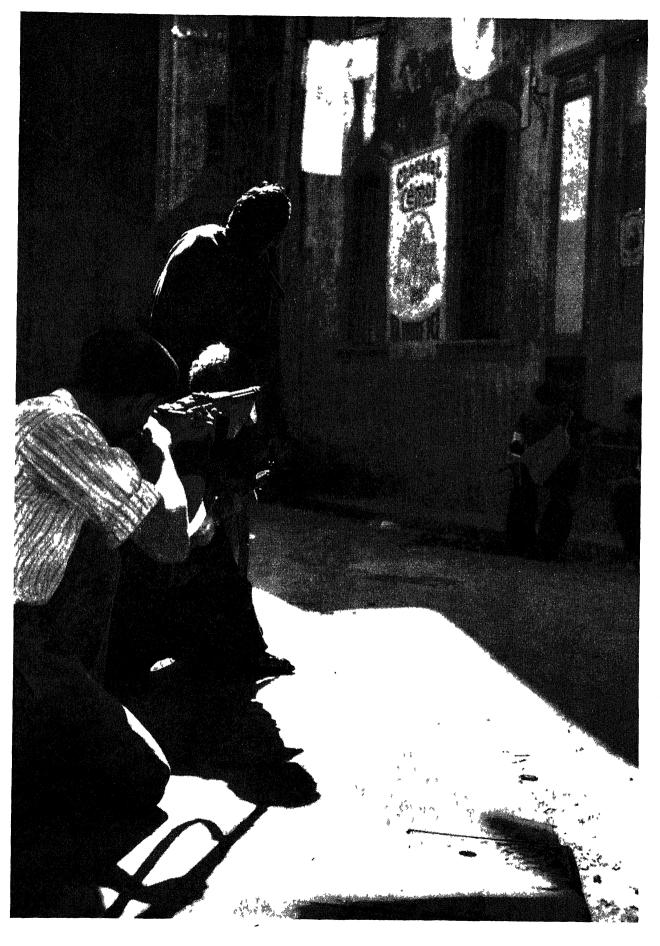

Asia.—After the desert campaign had been brought to a victorious conclusion, other British troops were employed in a not dissimilar role, though in greater strength, in southeast Asia. In April 1943 General Orde Wingate, who had already gained a reputation as a leader of irregulars in Ethiopia, led his first Burma expedition across the River Chindwin, on a journey of 1,000 mi. behind the Japanese lines. The Burmese jungle provided better cover than the desert, and, like it, was either uninhabited or else inhabited by a reasonably friendly native population. Meanwhile farther north, across the frontier, the Chinese were continuing the guerrilla activities which for more than ten years had constituted such an important part of their struggle against the Japanese. Once again, this was not a war of pitched battles, but a prolonged series of skirmishes and incidents of which the cumulative effect told in the long run.

In other theatres of war, and even where, properly speaking, no theatre of war existed, there were other guerrillas. Nor, during the decade under review, was it only in wartime that guerrillas made their mark. In Palestine, the Arabs before the war, and after the war the Jews, conducted well-planned and skilfully executed irregular operations against the British forces of occupation, while on the North-West Frontier of India the tribes carried on their centuries-old skirmishing against the British Raj. In each case the results showed how vulnerable modern armoured forces could be to guerrillas making intelligent use of tactics, enjoying the support at any rate of some sections of the population and operating in country suited to such operations.

Yugoslav Partisans.—But it was in a part of the world which had long been by tradition a scene of guerrilla warfare that guerrillas achieved during World War II one of the outstanding feats of arms in modern times. The peasant-warriors of Yugoslavia in common with other Balkan races had as their history a splendid record of resistance to the Turks and Austrians. This record they crowned by their resistance to the German and Italian forces of occupation during World War II.

When the Germans, with the Italians at their heels, invaded and occupied Yugoslavia in the spring of 1941, they made short work of the royal Yugoslav army, which, besides being hopelessly outnumbered, was badly equipped, badly led and, there was every reason to suppose, riddled with treason and corruption. But it was not until they had occupied Yugoslavia, divided it up into puppet states and installed "quisling" governments, that the troubles of the Germans and Italians really began.

When in 1943 the author was dropped by parachute into Yugoslavia as commander of the British military mission to the partisan forces operating there, those forces were already well established and had many notable successes against the Germans and Italians to their credit. They were also engaged in hostilities with the Chetniks of General Draja Mikhailovitch, who, after starting as a resist-

ance leader in 1941, had, partly from fear of axis reprisals and partly from hatred of the communist partisans, drifted into an equivocal position. The Yugoslav partisans, or army of national liberation, as they were later called, furnished an exceptional example of the results which could be achieved by guerrilla warfare at its best. They first entered the field in the summer of 1941. At first they consisted of small scattered groups of determined men and women under communist leadership, who had taken to the woods and mountains, practically without arms and supplies. Led by Josip Broz, known as Tito, a Croat metal worker and a leading communist, the movement developed rapidly. For arms and supplies the partisans relied on what they captured from the axis or were given by the local population. By daring attacks on German and Italian convoys or outposts, they provided themselves with material of war, which enabled them steadily to increase the scale of their operations. Their numbers increased with their successes. As their victories became known, their ranks were joined by Yugoslavs from all over the country, of all ages and from every walk of life. Of widely differing views and beliefs, they were united, as Yugoslavs had never before united, by the belief that the partisan movement under Tito's leadership offered the best chance of striking a blow for the liberation of their country, and all were filled with unquenchable enthusiasm for the fierce struggle in which they were engaged and for the new and better Yugoslavia which they saw as their ultimate aim and reward.

By the end of 1943 their total numbers were estimated as being in the neighbourhood of 150,000. This force, divided up into formations of varying strength, was distributed over the whole of Yugoslavia, being based for the most part in the wooded and mountainous areas in which that country abounds. Each partisan formation had its own headquarters, and these subordinate head-quarters were directly or indirectly responsible to Tito's general headquarters, which thus exercised effective administration and operational control over the entire force. Communications, where possible, were by wireless, use being made of captured axis sets, or, where these were lacking, by couriers, travelling precariously from one unit or formation to another through the intervening axis lines.

The war thus waged by the partisans was a strange one. There was no fixed front. Fighting, as they were, with small arms only and limited stocks of ammunition against a well-armed, well-equipped, well-supplied and motorized enemy, supported by plenty of armour, artillery and aircraft, it was necessary for the partisans to avoid pitched battles in which they would inevitably have been overwhelmed. If they were to succeed, it was essential that they should so far as possible retain the initiative themselves, and not allow it to pass into the hands of their opponents. Their aim was to attack the enemy where he presented the richest target, where he was weakest and, above all, where he least expected it. It was equally important, that, having attained their purpose, they should not linger but should fade once again into the background of hills and woods, where pursuit could not reach them. This necessitated a high degree of mobility. Their human resources, like their material resources, were precious. Any engagement in which enemy losses did not outnumber their own losses by at least five to one, the partisans reckoned a defeat. At all costs they had to deny the enemy a target at which he could strike back. As their numbers and the scale of their activities increased, this became harder. They had to resist the temptation to follow up and consolidate their successes. All gains had to be regarded as temporary. Villages and small towns captured by sudden attacks had to be abandoned again when the axis counterattacked in force. For the partisans to allow themselves to be forced into the role of a beleaguered garrison would have been a fatal mistake, as individual commanders were to learn on occasion by bitter experience. So "inhabited places," to borrow the phrase of the soviet war communiqués, changed hands time after time with their inhabitants, and each time became more battered and lost more inhabitants in the process.

The part played by the civil population, insofar as any distinction could be drawn between combatants and noncombatants, had a most important bearing on the struggle as a whole. The partisans relied on them to a very great extent for supplies, for shelter and for information. In all guerrilla warfare the attitude of the civilian population is of vital importance to the guerrillas. Throughout the country the partisans had organized a shadow administration, which, in the areas which they temporarily held, came to the surface and took charge of civil affairs, but which also led a precarious underground existence in the towns and villages garrisoned by the axis. Once, the author was guided through the axis lines at night by the head of the partisan underground organization in a neighbouring German-occupied village, who, after the Germans had been driven out, was to take over as mayor.

The population suffered atrociously for the support which they gave the partisans. In addition to famine and want, by which the ravaged country was swept, the Germans, the Italians, the Bulgarians and the various local quislings inflicted savage reprisals on the people of the country in revenge for the damage done by the partisans. Thousands of hostages, men, women and children, were massacred, and thousands of villages were pillaged and burned to the ground. Unlike the Chetniks of General Mikhailovitch, whose inactivity and reputed tendency to make terms with the Germans could largely be attributed to their anxiety to avoid such reprisals, neither the partisans nor their civilian supporters allowed anything to deter them from resistance to the axis. They reckoned that, in a total war of this kind where no quarter was given and none expected, everyone was in the firing line and all good patriots had to take their chance along with the combatants. And, in fact, the invaders, by their barbarity, defeated their own object, for such were the hatred and bitterness that it engendered, that the violence and intensity of the national resistance were redoubled.

Thus, long before the Allies, the Germans and Italians came to realize that the partisans constituted a military factor of first-rate importance against which a modern army was in many respects powerless. In the course of three years the axis launched against the partisans no fewer than seven full-scale offensives, each employing upwards of ten divisions with supporting arms. Once or twice larger forces of partisans came near to being surrounded and wiped out. Axis aircraft, against which they had no protection whatever, played an important part in discovering their positions and pinning them down, while suitable land forces were brought up to deal with them. But each time they succeeded in extricating themselves and reappearing elsewhere to attack the axis where least expected. Furthermore, during each of their offensives, the extensive troop movements involved exposed the invaders more than ever to the attacks and ambushes of the partisans. Thus these offensives failed in their

′

Guerrillas in the Italian underground movement provided effective resistance to nazis and neo-fascists during World War II. These partisans were active in the struggle to free Milan and in the capture of Mussolini

object, and the partisans, though tired, hungry and poorly equipped, continued their resistance undismayed.

The author's instructions, when he entered Yugoslavia, were to afford all possible assistance to the partisans who, by their operations, were containing a force of some 15 German divisions which could otherwise have been employed against the Allied armies on another front. His task presented many unusual problems. Despite the strength of the partisan forces, the Germans, though incessantly harassed by the partisans operating from their bases in the forests and mountains, continued in effective occupation of Yugoslavia. They garrisoned the principal towns and held, sometimes with considerable difficulty, the main lines of communication linking them. In these circumstances, all supplies to Marshal Tito's forces had to come by air and, what is more, had to be dropped by parachute. The author arranged for British officers under his command to be dropped to all the principal partisan formations. These were linked by wireless both to British headquarters and to the base in Italy. Their principal task was to organize the dropping of supplies to the partisan formations to which they were attached according to a central plan agreed by Tito and the author. It was not an easy task. Lack of aircraft, lack of suitable air-fields in Italy, bad weather and, last but not least, lack of parachutes were all limiting factors. Moreover, the partisans were constantly on the move, and the greatest precision and punctuality were necessary on the part of the pilots concerned if the supplies were to reach the right destination. A few hours' delay or an error of a few thousand yards might mean that the supplies intended for the partisans would be received with open arms by the Germans. The supply work done by R.A.F. and U.S.A.A.F. pilots in this connection was beyond praise. Flying conditions over the Dalmatian mountains in winter were appalling, yet night after night the pilots found their way through snow and cloud to the bonfires lighted on remote hillsides.

Later, Allied aircraft were able to use landing strips, improvised under the very nose of the axis, and, in addition to landing supplies, evacuated many thousands of partisan sick and wounded who, had they fallen into German hands, would have been relentlessly massacred. This restored their mobility to the partisan forces concerned and helped them to extricate themselves from many a dangerous situation. In this matter of the wounded, inevitably a bitter problem in guerrilla warfare, excellent

work was done by medical officers belonging to the British mission who in different parts of the country improvised hospitals, distributed medical supplies, and performed operations in the woods, in barns or in cow-houses. Often too, the partisans, themselves masters of irregular warfare, were glad of the experience of British officers gained in the western desert and on other fronts in handling new and unfamiliar weapons.

An extremely important Allied contribution to the Yugoslav war of national liberation was tactical and strategical air support. When the author's mission first arrived in Yugoslavia, before the establishment of suitably placed Allied air bases in Italy, it was a certainty that any aircraft signalled by the look-out was a hostile one, and the partisans, lacking all means of defense, were at the mercy of the German air force. Soon the tables were turned. The specially formed Balkan air force and U.S. 15th air force drove the Germans from the sky, and the British were able to call upon a considerable force of Allied fighters and bombers to support partisan operations. One of the principal tasks of the author's mission was the co-ordination of Allied air operations with partisan land operations, and on innumerable occasions impressive forces of Allied fighters or bombers came to the help of a hard-pressed band of partisans, or opened the way for a vigorous partisan attack, in response to a signal flashed by radio only a few hours before.

A good illustration of the potentialities of co-operation between guerrillas and a modern air force was provided during the final phase of the war in Yugoslavia. In the spring of 1944 the Germans launched their seventh fullscale offensive against the partisans, culminating in a parachute and glider attack on Tito's headquarters. But, like the six other offensives which had preceded it, this final effort petered out, without achieving its object. As they had done so often before, the partisans, on being attacked, retired into the mountain fastnesses, denying the axis any fixed target at which to strike and at the same time counterattacking where the axis least expected it and was weakest. On this occasion, too, the partisans had the benefit of lavish Allied air support, a most important asset. The failure of the seventh offensive was the beginning of the end as far as the Germans were concerned.

By now the effects of the Normandy landings and of the soviet victories in the east were beginning to make themselves felt in the Balkans, and there were at last indications that the Germans had decided to withdraw the forces of occupation from Greece and Yugoslavia.

The resulting military situation clearly offered unrivalled opportunities for both guerrilla operations and for Allied air attack against an enemy whose morale was already low and who was withdrawing over far-flung lines of communication through hostile and largely devastated country; and the ensuing period was one of close operational liaison between the partisans and the Allies. After a visit to the supreme Allied commander in chief and a series of conferences between Tito, his commanders and the author, a plan was drawn up for a series of carefully concerted and sustained attacks by partisan land forces and Allied aircraft on axis road and rail communications throughout Yugoslavia, to be made during the first week of Sept. 1944, which was given the appropriate code name of "Ratweek." During this period, more than 2,000 sorties were flown by Allied aircraft against German communications while the partisans did sterling work on the

ground. Bridges were blown up, locomotives destroyed and convoys strafed from the air or ambushed by the partisans, while British naval forces and partisan armed schooners swept the Dalmatian coast. As a result of these joint operations the Germans' communications were thrown into a state of utter confusion just as their withdrawal from the Balkans was beginning. The advantage thus gained was exploited to the full in the ensuing partisan offensive which culminated in the battle for Belgrade, in which the partisans were joined by soviet forces under Marshal Fedor Tolbukhin, who had crossed the Danube into Yugoslavia a short time before. With the fall of Belgrade, the final liberation of Yugoslavia was already in sight.

The Yugoslav partisans had their counterpart in occupied countries all over Europe, but nowhere did such a combination of geographical and strategical advantages, effective Allied support, natural warlike qualities and brilliant leadership make possible resistance on the same scale. In the other Balkan countries resistance was sapped by lack of unity and determination. In France and Italy it became a military factor of first-class importance only once the Allies had landed. In most other European countries it was limited by circumstances to isolated acts of sabotage or terrorist activities, although in the soviet union large bands of partisans operated behind the German lines, and, in Poland, the battle of Warsaw, which ended so tragically, was one of the epics of irregular warfare.

(F. Mac.)

The Philippines.—The unheralded actions of guerrilla organizations in the Philippine Islands in maintaining the morale of the country, obtaining valuable intelligence, and combating the Japanese physically were of great value during World War II. Though occasionally some hint of these activities appeared in print, wartime security considerations for the most part would not permit release of information on this interesting phase of the world conflict.

Long before the war, officers of the U.S. army had expressed grave doubt as to the defensibility of the Philippines in event of attack. The long supply lines from the United States would, it was thought, present an almost insurmountable obstacle to a successful defense in the first stages of a war. They foresaw that guerrilla action could play an important part both in delaying the initial conquest by an invader and in rendering assistance when liberating forces could be organized.

The U.S. commander in the islands, Gen. Douglas MacArthur, had spent many years there and had plans thought out years before the war began. Guerrilla warfare came natural to the Filipinos who, for the most part, were determined to fight the Japs in all possible ways. Guerrilla action varied from one Moro swinging his bolo at a Jap neck to engagements involving hundreds of troops.

However, organization of the guerrillas was not left to chance. Before he left Bataan, Gen. MacArthur dispatched several small groups of officers—many of them intimately familiar with the islands—to disperse themselves, evade the Japs, and organize guerrilla bands. Each group, the largest of which contained no more than 15 men, included specialists in engineering, communications and other technical subjects. Though these units were organized and departed hurriedly, all knew their principal mission—to obtain and send back intelligence. The secondary mission was to hamper Japanese control of the country as much as possible, and to prepare to offer active assistance against the Japs when the reinvasion, even

then being planned, began.

The officers assigned to guerrilla duty escaped across Manila bay from Bataan a short time before its capture, and with others who had been cut off earlier in the campaign, wormed their way to the eastern and northeastern parts of Luzon. There they remained in groups for a while, but as the Japanese consolidated their conquest and established garrisons in the towns and villages, the Americans were forced to separate for added security. At first, pending perfection of local contacts, the greatest problem was to evade the Japs. But as comparatively few officers were available, they had to be spread thinly in any case, to extend the organization of guerrilla bands.

As outlying areas were subjugated, further contributions were made to the irregular forces. For the moment the Filipino soldiers simply put on civilian clothes, hid their weapons, and went home. When active bands began to be organized later, many of these caches were recovered. In some cases, fairly large scale operations had to be undertaken to regain such supplies. Most of the guerrillas eventually obtained U.S. calibre .30 Enfield rifles, though many used captured Japanese weapons.

After bands had been organized throughout the islands, intercommunication became one of the major problems. Small receiving sets from native homes were about the only radio equipment available. Replacement batteries and tubes were scarce. The guerrillas salvaged or stole storage batteries which they charged by use of ingeniously contrived generator units. The fuel for driving generators as well as for vehicles was obtained by distilling alcohol from tuba, the fermented juice of the palm tree. With these simple sets, about all that was picked up was an occasional bit of news from outside. Even this was of great value in keeping up spirits and providing a source of propaganda. Maintenance and repair of the radio equipment was a major feat of improvisation.

Messengers were relied upon for communication among units, though on some of the islands extensive telegraph lines were in operation. These were made from fence wire, straightened, spliced, and strung on broken pop bottles for insulators. Because of its central location and its being the largest source of Jap information, Manila logically became the message centre. Word brought in by representatives of various bands was passed around orally until eventually it seeped back to the other groups, often months later.

There were many false rumours. As most of the natives expected the liberation campaign to start at once, there were numerous spurts of anti-Japanese activities. Then, when no U.S. troops appeared, weapons were put away again and everyone went back to work. Suspicion of all strangers was a great factor in the difficulty of communications. It was perilous to be an outsider, and many were killed solely on suspicion. While this had its disadvantages in circulating information, it worked both ways to some extent; there were few instances in which the Japs knew of guerrilla plans or dispositions with any certainty.

The main effort during 1942 was directed toward perfecting organization, obtaining information on the Jap intentions and troops, and making plans for future actions. A few combat operations were undertaken, some to test guerrilla tactics and some for training, others based on false rumours of reinvasion.

Late in 1942 the first radio contact was established between the guerrillas and Gen. MacArthur's headquarters in Australia. MacArthur re-emphasized the prime importance of intelligence and completion of the communications network as a necessary adjunct thereto. Soon there-

after, limited supply by submarine began, first to Negros Island, then to Mindanao and other southern islands. With the availability of standard radio equipment communications improved greatly, and really co-ordinated action became possible for the first time without elaborate long-range planning. Not so important but still most useful were shipments of medicines, explosives, arms and ammunition and clothing.

Information began to flow southward as soon as the bands to the north knew that contact with MacArthur had been made. Requests for detailed information began to come in, and requests went out for certain vital supplies, with instructions as to how and where they might be delivered. Propaganda material was greatly desired. Such items as match booklets and chocolate bars bearing the inscription "I shall return—MacArthur" were very popular. Requests for them came from all over the islands.

By the spring of 1943 the number and effectiveness of the guerrillas had grown at such a pace that MacArthur felt it necessary to hold them back. He did not want the Japs provoked into organizing a major effort to break up the units.

Contact by submarine finally linked all the larger islands by April 1944, and after that date all the principal guerrilla elements were in regular radio communication with G.H.Q. Well before the reinvasion began, plans were made and actions co-ordinated, though to keep the Japs guessing, no definite date or places were mentioned until just before action began.

During the first phases of the landing operations, the guerrillas confined most of their efforts to obtaining intelligence and identifying "spot" targets for attack by U.S. planes. The combat troops were held in readiness till the final word came from MacArthur.

Luzon.—Scattered isolated elements of the U.S.A.F.F.E. (United States Army Forces in the Far East) in northern Luzon had formed bands and started guerrilla activities long before Bataan fell. By Jan. 1942, small groups each led by either an American or a Filipino were operating north of Pangasinan.

In Feb. 1942 Gen. MacArthur sent Lieut. Col. Thorpe, 26th cavalry, Philippine scouts, through the Japanese lines from Bataan to organize and co-ordinate native resistance. The small party arrived in the vicinity of Mount Pinatubo, back of the Jap lines, late in March. Early the next month another party set out from Bataan by boat to establish radio contact with Col. Thorpe and conduct intelligence operations. When Bataan fell, other officers joined up and plans were made for organizing the Luzon Guerrilla army forces. Luzon was divided into four guerrilla areas, as follows: northern Luzon, consisting of all provinces north of Nueva Ecija, Tayabas, and Pangasinan; west central Luzon, containing the province of Zambales; southern Luzon, which included the provinces south of Manila; and east central Luzon, which comprised all of Manila and its suburbs, plus the provinces of Pangasinan, Nueva Ecija, Tarlac, Pampanga, Bulucan and Bataan.

For recruiting, each province in the four main areas was organized as a military district with a commander appointed either by the area commander or by Col. Thorpe. The district commander organized his staff along the lines of divisional staff sections and selected regimental commanders who continued similar organization and appointment down to the selection of platoon leaders. The platoon leaders then continued the process down to the squad level. The privates were recruited by the squad leaders. Thus the squad members knew only

their leader, who knew only the platoon sergeant and lieutenant, and so on.

With the exception of those on active duty with intel-

With the exception of those on active duty with intelligence sections at the various levels, all guerrillas remained in their homes, keeping their normal occupations. For security every guerrilla took an assumed name. Unit commanders checked loyalty, determination and courage of the members by various means. Military offenders were tried and sentenced by district courts-martial patterned after those of the U.S. army.

On Luzon, between 50 and 100 U.S. officers took part in guerrilla activities. In 1944 a typical guerrilla group of 5,000 Filipinos contained only three Americans. One of the U.S. officers who escaped from Bataan, Col. Russell W. Volckmann, hacked his way through the jungle with a small party containing only one other American. He went into hiding north of the Olongapo road, then, after spending two months recuperating, made his way to northern Luzon and joined guerrilla forces there.

In June 1943 Col. Volckmann took command of about 8,000 guerrillas in that area. These forces had been harassing the Japs by ambushing trucks, destroying bridges and dumps, and raiding for arms and ammunition. Then, under orders from headquarters in Australia, they laid low and established an extensive intelligence network.

Four days before the Lingayen landing they renewed their efforts, destroying bridges, roads and communications, attacking airfields, supply dumps and convoys, and generally creating havoc in the Jap rear. Taking the offensive, they drove the Japs out of San Fernando and La Union, and continuing south, met the 33rd U.S. division driving north at Bawang. They soon grew to 20,000. Several operations and heavy fighting carried them in an eastward swing across two mountain ranges, bringing them to the Yamashita pocket, where they joined the 32nd and 6th divisions in that final operation.

The five regiments involved were recruited from Ilocanos, Igorots, Lowlanders and other Filipino tribes. They suffered 25% casualties, losing about 5,000 killed and wounded while killing an estimated 50,000 Japs and capturing 32,000. In accomplishing this, they destroyed the Japanese 79th independent brigade (Gen. Araki) and the 19th division (Gen. Osaki). The east central Luzon group had 28,000 men of whom 21,500 were attached for combat operations as follows: 6th army, 1st corps, 8,000; 1th corps, 5,000; 14th corps, 6,000, and signal base depot, 2,500.

Before the reinvasion of Luzon, the primary mission was intelligence. Combat units were organized secretly; the regiments were inactive initially. An officer training school was organized near Manila and was staffed by graduates of the Philippine Military academy. The curriculum included minor tactics and the techniques of infantry combat, intelligence, counterintelligence and sabotage. Supplies were obtained mainly by voluntary subscriptions, supplemented by raids on Jap stores and convoys for arms and ammunition.

The intelligence unit of E.C.L.G.A. (East Central Luzon Guerrilla Area), centrally controlled and organized, was typical. District, regimental and battalion intelligence officers operated in their respective territories. Information of operational importance was checked, collated and evaluated by the district G-2. Such information included enemy identifications, land, sea and air movements, data needed for strategic planning, and counterintelligence. From the intelligence net came vital data on order of

battle, installations, concentrations, airfields, depots, lines of communication, factories, movements and the like. Information reached the area G-2 within 24 hours, and the important items were transmitted to Gen. MacArthur's headquarters by radio. Such materials as sketches, enemy documents and reports were dispatched by courier who went by sailboat to Mindanao or Panay. There Col. Wendell W. Fertig and Lt. Col. Peralta, respectively, received the reports and forwarded them by submarine. After Oct. 1944 an advance detachment of MacArthur's headquarters, commanded by Lt. Comm. George Rowe, U.S.N.R., maintained contact with area G-2. This detachment had landed by submarine on Mindoro in July 1944. To it were sent intelligence materials that required physical transmission, also U.S. pilots recovered by the guerrillas after being shot down over the islands.

Headquarters, E.C.L.G.A., was established on Mt. Balagbag, where it commanded a view over Manila bay. Radio was installed, and movements of vessels in the bay were reported regularly. Numerous Jap attempts to capture the headquarters failed, but finally their efforts became too confining, and the station and records were moved to the Leprosorium in Novaliches. The lepers had gone from the institution, but the Japs avoided it.

One of the largest intelligence nets operated inside Manila. Members worked in airfields, communications centres, railway facilities, depots, factories and government offices. They made daily reports on their missions, prepared maps and sketches of defenses, studied enemy tactics and methods, and when opportunity was presented, liquidated Jap counterintelligence agents or sabotaged installations. Some agents worked with the Japanese military police, thus obtaining information invaluable in giving timely warnings of planned raids on guerrilla headquarters or in aiding the escape of prisoners.

After the first bombing of Manila, in Sept. 1944, the guerrillas on the spot contributed to accurate bombing and destruction of military objectives in that area. This they did by spotting air defenses, dispersion areas, billets and other installations of the Japanese.

Sabotage was directed and co-ordinated, though it was handicapped greatly by lack of suitable materials. Bridges were burned, telephone lines damaged, patrols ambushed and supply dumps raided. Anchored tankers and supply ships were set afire, and piers burned.

Action was taken against Filipinos who collaborated with the Japanese.

During the invasion of Luzon by U.S. forces, a plan was made to liberate prisoners held in a Jap concentration camp near Pangatian. Aided by Filipino guerrillas covering both flanks and establishing road blocks, the 6th Ranger infantry battalion conducted a successful raid and freed the prisoners.

Manila, May 20, 1945: American 43rd division troops and Filipino guerrillas drew tighter a mountain trap on thousands of Japanese in the Sierra Madre east of Manila Saturday after capturing Ipo dam, source of one-third of the city's water supply. The Nipponese force is believed to be the largest ever completely circled in the campaign to liberate the Philippines. Officers reported the trap was closed Thursday when the doughboys and Filipinos secured the vital dam intact.

The above brief communiqué concerned another joint operation of U.S. and Filipino guerrilla troops. The battle was essentially a division show. The terrain involved was the rugged, brush and bamboo-covered foothill area of the Sierra Madre range on Luzon. The objective was definite—the vital Ipo dam, held by the Japs.

The enemy was a well-organized force of about 4,500 with ample artillery support. They had retreated into the position early in the campaign, taking with them quantities of ammunition, food and medicines. Their time had been well spent in making elaborate defensive works consisting of caves, trenches and holes.

The attacking forces consisted of the 43rd division, plus the "Phil-American Yay Regiment" of guerrillas. While the division attacked from the southwest, the guerrillas were to swing around to the north under cover of darkness and come in from that direction. This manoeuvre was made on foot trails over the mountains, and was smooth and undiscovered. Communication with the guerrillas was solved by use of radio equipment serviced by air-dropping of batteries and other supplies. The only Americans with the Filipinos were forward observers from the division artillery. After the attack started, its progress was delayed three days by heavy rains, but the tempo increased with clearing weather, the final phase coming ten days after the jump-off. While the guerillas pushed through to the north end of the dam, the 103rd regimental combat team on the right seized the south end. The objective was taken intact, the final thrust having been so swift that there was not time to fire the demolition charges already placed. The Japs lost 2,757 counted dead and 108 prisoners, plus large quantities of matériel, while the attackers suffered 172 dead and 676 wounded.

Leyte.—Col. Morgan, an American formerly in the Philippine constabulary, was instrumental in organizing the guerrillas on the southern coast of Leyte. During the summer of 1942, the Japs had not bothered much with this island, most of their forces having rolled on south. Later in the year, after a few encouraging "incidents," guerrilla bands began to spring up all over Leyte. At first they had poor leadership, and some used the war as an excuse to raid villages for food, clothing and arms. Col. Morgan unified the guerrillas into military departments with co-ordinated control.

Col. Ruperto Kangleon, a Filipino army veteran with many years of service, had escaped to Leyte and finally headed the resistance forces there. His units made contact with Col. Fertig in Mindanao, and through him obtained radio equipment from Australia via submarine and sailboat. Ammunition supply was one of the major problems. Using fired cartridge cases, scrap metal and powder from Jap mines, the guerrillas made their own ammunition, crude but effective. They even improvised cannon. Gasoline, too, was very scarce, but alcohol proved a usable substitute.

Kangleon organized a local government of his own. Critical materials were requisitioned from the people with payment made on the basis of postwar funds. Paper money was printed as temporary currency. Jute sacking provided material with which the troops were uniformed after a fashion, and drills and exercises gave the men experience in military action.

As in the other islands, the guerrillas were too weak to risk major encounters but kept pecking away at the Jap when suitable opportunities were presented. The Japs occupied the coastal towns but never succeeded in driving the guerrillas out of their hills.

Prior to the U.S. invasion, the Leyte units performed very useful service in plotting Jap mine fields among the neighbouring islands. When the initial landing in the Philippines came at Leyte, the guerrillas had only a few days' notice. This was for security reasons, as everyone had been expecting an attack far to the south, probably aimed at Davao, in Mindanao. After the first surprise of the

Leyte landing, MacArthur kept up a constant flow of warning orders to guerrilla units, assigning missions to be accomplished in connection with certain operations.

Cebu.—The Cebu area command was headed by Col. James M. Cushing. He organized a tattered but well-trained guerrilla force, armed with a mixture of Jap and U.S. weapons, plus some homemade ones.

In Feb. 1945 the Cebu units engaged in a typical joint operation. A support party of the 13th air force was landed on a temporary flying strip to work with planes which had been assigned to assist in fighting the Japs. The guerrillas moved and guarded the radio equipment and personnel. Then, by direct observation from hill tops and by marking of guerrilla lines with panels, accurate air support was made possible. With this help, the guerrillas chased the Japs from the towns of northern Cebu. Later, units of the U.S. 8th army captured Cebu City, with guerrilla co-operation.

Mindanao.—Early in 1942 formal fighting between the Japs and Filipino troops on Mindanao ceased. The local troops, ill-armed, finally split into fragments of an army. On May 27, 1942, Brig. Gen. Guy O. Fort, commander on the island, capitulated on orders from Lieut. Gen. Jonathan Wainwright. Guerrilla activities did not cease, however, with his surrender. Soon there were thousands on the rosters. The guerrillas organized a civil government, collected taxes, held court, printed money, even ran a welfare and relief fund. In fact, they did about everything except reopen the schools.

News from outside was hard to get. The air was full of Japanese propaganda, and they printed it on leaflets and in the papers. Finally some U.S. reports began to come through, and with the first U.S. successes in the Solomons, everyone took heart.

At first, the Japs were rough on guerrillas. They burned whole villages in retaliation for one sniper's shot. Captured U.S. and Filipino guerrillas were brutally treated. Such tactics slowed the guerrillas, but eventually the drain on Japanese resources became too great and they tried to placate the natives instead of coercing them. The guerrillas were constantly being sought by the Japanese, but in the wooded hills they were not easily taken. Often, after initial rough experiences, the Japanese simply avoided certain areas.

Though initially the Japs had carried the fight to the irregulars, later their attacks grew rare; unless they had received large reinforcements they merely conducted routine patrols. Finally they actually agreed with the Moros that they would patrol only occasionally if the Moros would promise not to fire on them. In the next stage, the guerrillas began to attack Japanese camps and garrisons.

In 1943 there were several thousand organized troops on Mindanao under Col. Fertig, and communication had been established with similar groups on Panay, Misamis and Negros Islands. On the latter, radio equipment had been improvised and contact was made with MacArthur's headquarters in Australia. In March 1943, a U.S. submarine arrived with ammunition, medicines and other items requested by radio. This was the first of many such visits. MacArthur sent instructions not to push the Japs too hard so as to bring on a crushing counter blow, as he desired the guerrilla's main strength saved for the contemplated reinvasion. Meanwhile he wanted maximum intelligence.

One of the largest Japanese anti-guerrilla drives on Mindanao took place in June 1943. They used about 2,000 troops, carrying them on seven transports, with a light cruiser and 11 aeroplanes for escort. Their main obcoast, scattering the guerrilla bands, but the expedition was for the most part unsuccessful.

Though the combat efforts of the Philippine guerrillas were not inconsiderable, their most important over-all contribution to the cause of liberation was military intelligence. This helped MacArthur greatly, both in planning and carrying out the reinvasion and in earlier operations

jective was to capture the leaders of the Filipino forces.

They made surprise landings at many points along the

elsewhere. They identified Japanese troop units en route either to or from other theatres and passed on this information to MacArthur's headquarters in Australia.

By their unified resistance to the Japanese and their fine co-operation with United States forces in the liberation of their homeland, the citizens of the Philippine Islands justified every confidence that had been placed in them. Guerrilla action during the Jap occupation increased the pride of the inhabitants in their race and nation. Under great stresses they proved their coming of age and their worthiness of independence. (B. R. L.)

Conclusions.-What lessons of guerrilla warfare could be drawn from World War II? In the first place, the principles of guerrilla warfare which had held good since classical times were confirmed. Guerrillas still had to be mobile and elusive, in order that they might strike at the enemy where he was weakest and least expected it, and at the same time deny the enemy any target at which to strike back. Thus, however vast regular armies became and however elaborate their equipment, guerrillas still had to operate in small bands, and could not burden themselves with arms or equipment that would impede their mobility. In World War II, more than ever, a guerrilla could never risk a pitched battle; he had always to retain the initiative himself, and never allow himself to be forced on to the defensive, for, how should lightlyarmed foot soldiers stand up to tanks, artillery and aircraft? For this same reason the element of surprise and therefore the necessity for good intelligence were also more important than ever. If guerrillas were to get the best of armour, artillery and aircraft, it was essential that they should attack before they were themselves attacked., The intelligent Yugoslav child of 12, who accounted for a German Tiger tank and its crew by slipping a hand grenade unobtrusively into the open turret, would have fared less well in any other type of encounter with a tank.

On the other hand, the very fact of the vulnerability of modern weapons, equipment and military installations to sabotage and surprise attacks multiplied the targets open to guerrillas and increased the importance of their role in modern warfare. More than ever was the choice of targets important. Well-timed attacks by guerrillas or other irregular forces on well-chosen targets could, by destroying vital links in the strategical chain or by diverting and containing essential forces, throw out a whole plan of campaign.

Economy of resources was of paramount importance. The guerrilla could not content himself with an eye for an eye and a tooth for a tooth. He had to aim at achieving a maximum of result with a minimum of expenditure of human and other material. His war was what Lawrence of Arabia termed a "war of detachment."

The geographical factor likewise was important; a suitable field of operations was an absolute necessity to guerrillas. Of such fields, the 1940s provided a variety of illustrations. The western desert, the Ethiopian highlands and scrub, the Burmese jungle, the Philippine hills, the

mountains and forests of the Balkans, the vast Russian expanses, the hills and valleys of Palestine all harboured irregulars of one kind or another. Even the tenements and back streets of great cities proved their value as a background for guerrilla operations. Furthermore, in World War II, the rapidly shifting front of a war of movement greatly increased the opportunities of infiltration, and even regular units and formations on occasion found themselves operating behind the enemy lines to the surprise of all concerned. Nor had the part always played in guerrilla warfare by the civilian population decreased in importance.

What new elements had been introduced into guerrilla warfare since Lawrence first equipped guerrillas with machine guns and modern high explosives? Both of these weapons had since been perfected and developed, and had now become the stock-in-trade of the latter-day guerrilla, but the two innovations which revolutionized modern guerrilla warfare, the aeroplane and radio, were still in their infancy in World War I, although Lawrence seems to have foreseen the uses to which they could be put. These uses were double edged. Both aircraft and wireless could be used in pursuit of guerrillas as well as in support of them, and it was a matter for discussion in which role they were more effective. Certainly aircraft could be used with deadly effect in seeking out and pinning down guerrillas in hiding places which would otherwise be inaccessible. In fact, in many respects they constituted the most effective weapon against them. Well-placed agents, too, equipped with radio transmitters, could be very effective.

But on the whole the guerrilla probably did not lose by the introduction of these modern conveniences. The small portable radio transmitting and receiving set provided him with the ideal means of communication with his comrades in the field and also with his main forces or allies and his base or sources of supply, from all of which he had hitherto been cut off save for occasional messages by courier or other equally precarious means of communication. The possibilities thus offered of concerting and co-ordinating the operations between irregular and regular forces were clearly immense. Finally, aircraft could be a great asset to irregulars of all kinds, both as a source of supplies and reinforcements and employed operationally in tactical or strategical support of guerrilla operations. There could be no better illustration of both these uses of aircraft than the air support given by the Allies to the Yugoslav partisans. (See also TACTICS OF WORLD WAR II; WORLD WAR II.)

Guevara, Juan Gualberto

Cardinal Guevara (1882—), archbishop of Lima and primate of Peru, was born in Arequipa, Peru, on July 12, 1882. He was educated at the Colegio San Vicente de Paul, the Seminary of San Jeronimo and the University of San Agustin at Arequipa, and the Latin-American Pian college and the Gregorian university at Rome. He was ordained to tne priesthood in 1906 and later returned to Arequipa, where he was vice-rector of the seminary and

attended the university. In 1920 he returned to Rome to continue his studies.

Before being consecrated bishop of Trujillo in 1940, Archbishop Guevara served as apostolic administrator of Huaras. In 1943 the see of Trujillo was raised to metropolitan rank and its ordinary became an archbishop. Following the death of Archbishop Pascual Farfan in Sept. 1945, he was transferred to the primatial see of Lima. Archbishop Guevara was proclaimed cardinal by Pope Pius XII at consistory on Feb. 18, 1946.

Gustavus V

King Gustavus of Sweden (1858-), was born at Drottningholm on June 16, 1858, the son of King Oscar II and Queen Sophia Wilhelmina; he ascended the throne in 1907.

As King Gustavus advanced in years and prestige, the Swedish people feted him with magnificent celebrations. On his 80th birthday in 1938, cities and villages throughout the land were decked with flags in a general testimonial of love and respect for him, and an assertion of the national unity which he had laboured to develop. On into 1946 and the ripe age of 88 he continued to play tennis regularly, though he had to forego his customary trips to the Riviera during the war years, and in 1946 a slight heart attack brought at least a temporary cessation from his favourite sport. "Mr. G." was the royal personification of Swedish vigour and common sense.

In the fall of 1939 it was King Gustavus who gathered in Stockholm the heads of the northern states, including the president of Finland, in a gesture of Scandinavian solidarity and neutrality—a gesture not, however, strong enough to prevent the soviet attack on Finland. In World War I he had been the leader in Scandinavian neutrality; in World War II his country was soon left as the one neutral in the north. The King was unquestionably one of the chief influences holding the Swedish ship of state rigorously to her course of neutrality. He knew how to maintain a policy that was firm enough to preserve self-respect and independence, and flexible enough in wartime exigencies to preserve peace. In the constitutional democracy which Sweden had become, it was difficult to see clearly what part the monarch played, but his knowledge and

King Gustavus on the beach at Saeroe, Sweden, in the summer of

his skill, and the universal respect in which he was held, gave him a particularly strong influence in the country's foreign policy.

In 1946 young Prince Carl Johan, grandson of the King, married a commoner and according to custom was deprived of his titles, and took the family name of Bernadotte. A nephew, Count Folke Bernadotte, who had earlier married a commoner, played a significant role in the last days of the nazi reich, acting as go-between with the Allied command. The family was versatile and large, and the succession to the crown was assured for many years to come. (F. D. S.)

Gymnastics

National American Athletic union honours from 1937 to 1946 were principally divided three ways in each of the various gymnastic classes. George Wheeler of Pittsburgh, Pa., Arthur Pitt and Frank Cumiskey, both of Union City, N.J., shared the men's championship. The women's all-around championship was dominated by the Philadelphia, Pa., trio of Pearl Perkins Nightingale, Helm McKee and Clara Schroth. The Swiss Gym society of

Union City dominated the men's team competition, followed by Penn State college and the University of Illinois.

In the men's all-around test, Wheeler held the championship from 1937 to 1941. Pitt, a member of the strong Swiss Gymnastic society, captured the all-around crown from 1942 to 1944, and his teammate, Cumiskey, took charge in 1945 and 1946. Cumiskey, a 33-year-old postal clerk, lost the 1944 championship to Pitt by two-tenths of a point. He defeated Pitt the following year by 46.1 points.

Mrs. Nightingale, as Pearl Perkins, won the first of her three championships in 1937, and repeated as Mrs. Nightingale in 1941 and 1943. Miss McKee brought Philadelphia the titles in 1938 and 1944, while Margaret Weissmann of the New York, N.Y., Turner Verein spoiled Philadelphia's ten-year dominance with her all-around victory in 1939. Miss Schroth, representing the Philadelphia Turners, won the women's championships in 1945 and 1946.

Union City, N.J., gymnasts won six of the ten men's championships from 1937 to 1946. Under the title of the Swiss Turner Verein, the Union City team won from 1937 to 1939, and repeated in 1942 and 1944–46 as the Swiss Gymnastic society. The University of Illinois broke the Union City team dominance in 1940 and tied the Bohemian Gymnastic Union Sokol of New York in 1941. Penn State college annexed the team title in 1943 and 1945.

	National A.A.U. Gymnastic Champions, 1937 to 1946												
Year	Men	Women	Men's Team										
1937	George Wheeler	Pearl Perkins	Swiss Turner Verein, N.J.										
1938	George Wheeler	Helm McKee	Swiss Turner Verein, N.J.										
1939	George Wheeler	Margaret Weissmann	Swiss Turner Verein, N.J.										
1940	George Wheeler	No contest	University of Illinois										
1941	George Wheeler	Pearl Nightingale	Univ of Illinois and Bohemian Sokol, N.Y.										
1942	Arthur Pitt	No contest	Swiss Gym society, Union City, N.J.										
1943	Arthur Pitt	Pearl Nightingale	Penn State college										
1944	Arthur Pitt	Helm McKee	Swiss Gym society										
1945	Frank Cumiskey	Clara Schroth	Penn State college										
1946	Frank Cumiskey	Clara Schroth	Swiss Gym society										

Gymnastics, because of its emphasis on physical fitness, attracted increased attention during World War II. Of interest was the large number of young people in the U.S. national championships, especially among women. Margaret Dutcher of Ridgewood, N.J., and Leonora Owens of Philadelphia won their second national titles as 16-year-olds in 1946. Miss Dutcher's championship was in clubs and Miss Owen's in tumbling. (M. P. W.)

Gynaecology and Obstetrics

Sulfanilamide was first discussed in connection with diseases of women and obstetrics in the early 1940s; its derivatives sulfadiazene and sulfathiazole later displaced it because of the ill side-effects of the original and a certain degree of bactericidal selectivity in these derivatives. Subsequently, the effectiveness of penicillin for combating infections was noted. This new preparation was more potent in wider application, with definitely less incidental ill-effects on the patient than chemotherapy by sulfaderivatives. Sulfathiazole was demonstrated by army and navy medical officers, working under controlled conditions on large series of patients, as being quickly effective in almost all of the infections susceptible to sulfa-

therapy and especially so in both gonorrhoea and syphilis.

Penicillin was at first presumed to be without untoward reactions on the patient. In 1945 the innocuousness of its use during pregnancy was questioned by H. M. Leavitt, who found that either the penicillin or the mould from which it was developed might cause bleeding from both the nonpregnant and the pregnant uterus. This matter was still unsettled in 1946, and might result in curtailment of the use of penicillin during pregnancy.

Moreover, neither sulfa preparations nor penicillin are potent against certain organisms, notably gram-negative bacilli, such as typhoid and tubercle bacilli, and are relatively ineffective in infections in which colon bacilli predominate. Pyelitis, during pregnancy or otherwise, of colon bacillus origin, may be entirely unaffected by even intensive treatment with either or both of these preparations.

Streptomycin, given by intravenous or intramuscular injection, was shown by W. F. Elias and J. Durso to be excreted in high concentration in the urine. At high concentration, most resistant bacteria are quickly killed, so that streptomycin gave promise of becoming the treatment of choice for urinary infections.

The use of penicillin prophylactically in potentially infected obstetric and gynaecologic cases became widely accepted. It, alone or with sulfonamide preparations, was considered especially valuable in caesarean section on infected women.

The net result of these outstanding improvements in the treatment of puerperal infection together with general betterment of technique was a reduction in maternal mortality in the United States over a ten year period to a low rate of 2.3 deaths per 1,000 live deliveries. Their effect on infected gynaecologic and other surgical operative cases was a similar improvement in death rates.

Advances in the technique of blood transfusion and the general familiarity with the use of plasma were lessons learned from World War II. Blood and plasma banks became widely established, and commercial distribution of plasma also contributed generously to the availability of this life-saving medium. At the beginning of the decade 1937–46, a blood transfusion was often a "last resort" measure, and the use of plasma infusions was virtually unknown. Both were commonplace by the end of the decade.

Human serum albumen, made by fractionation from the most osmotically active portion of plasma (a military development) was another type of blood substitute. Its extremely rapid action in shock makes it a highly valuable obstetric weapon. In the production of serum albumen a by-product was found and named fibrin-foam. It is a sticky, spongy or foamy mass made by whipping liquid fibrinogen, and clotting it by adding thrombin. It is a haemostatic agent which found some use in both obstetrics and gynaecology.

Pregnancy.—Routine Wassermann reactions early in pregnancy advanced from the status of an advisable procedure to one legally required in many communities.

A recognition of the cause, prevention and treatment of erythroblastosis foetalis as being the result of certain incompatabilities between maternal and paternal bloods was initiated chiefly by C. T. Javert, L. F. Richdorf, W. S. Kearney, P. Levine and others in 1941 and 1942. Briefly, this condition may develop when the Rh factors of the mother's blood are minus and the father's positive with the infant inheriting the Rh + factor in predominance.

The transmission of Rh agglutinogen from foetal into maternal circulation, resulting in isoimmunization of the mother with formation of antibodies and their transmission through the placenta into the foetal circulation, are the responsible factors in the red cell haemolysis and other foetal symptoms known as erythroblastosis.

The result of this knowledge was to place the routine testing of mothers' blood for Rh factor on the same basis as that formerly occupied by blood testing for signs of syphilis, namely, an elective procedure widely followed in the better clinics. It was to be hoped that it would soon be legally required.

Advances in the treatment of the condition, with greater prevention of infant deaths from erythroblastosis, resulted from the elucidation of its mystery. These studies also resulted in priceless information regarding certain hitherto inexplicable sudden deaths among parturient women requiring transfusions whose husbands or others with positive Rh blood factor had been used as donors for these isoimmunized women.

Roentgen-ray pelvimetry during pregnancy became highly developed and widely applied, particularly as an important diagnostic and prognostic measure in women with pelves of doubtful size. Many papers appeared on this subject in which H. Thoms was a pioneer.

Anaemias peculiar to pregnancy became more commonly discovered and treated earlier because of the growing tendency to perform routine blood counts as a necessary part of antenatal care.

Vitamin deficiencies during pregnancy were studied apace, with general medical observations on this subject. They were found to be more common to the pregnant than the nonpregnant state, and certain of them are highly important. Increase in Vitamin D intake is essential to pregnancy as an aid to calcium metabolism and bone growth; deficiencies in Vitamin B were accredited as an aetiologic responsibility in toxaemias of pregnancy. Comparatively little new was accomplished during the decade on the cause or treatment of abortions, habitual or otherwise, or in the cause and treatment of pregnancy toxaemias.

During 1945 the sensational fact was established that an attack of rubella (German measles) early in pregnancy will result in congenital deafness or congenital eye defects including blindness, or both, in the infant in more than 50% of all instances. Congenital cardiac disease is another complication of this disease. After the third month, the disease in the mother is much less likely to be followed by congenital defects in the infant. According to some authorities, several of whom promptly studied and confirmed the original findings, if rubella occurs during the first two months of pregnancy, 100% of the infants will have such serious congenital defects that therapeutic abortion is advised.

The diagnosis of placenta previa by roentgen-ray pictures using "soft tissue" technique to disclose the outline and location of the placenta was a notable advance over earlier dependence upon risky digital examinations.

Labour.—Caudal analgesia for relief of pain during labour and delivery attracted wide attention and reception. At first it was overendorsed; professional opinion, however, settled down to the concept of the originators, R. A. Hingson and W. B. Edwards, that the method must be used only by specially trained experts and only in selected cases. Caudal analgesia was utilized to advantage for additional special purposes, notably labour in preeclampsia or eclampsia, for relief of pain and swelling from the vasospasm of thrombophlebitis, and also for "cervical dystocia."

Sodium pentothal administered intravenously proved satisfactory both for operative (low forceps) and for spontaneous delivery. Procedures for which it is to be used must be short, because the infant is affected and anaesthetized after 10 to 20 minutes of its use.

The new synthetic, demerol, was recommended as a substitute for morphine for almost all obstetric purposes, but had not yet been fully accepted in this respect by the end of the decade. (See also Anaesthesiology.)

Induction of labour for justifiable reasons became an accepted procedure. The method of rupturing the membranes and initiating uterine contractions by minute, repeated doses of pituitary extract displaced the use of bags and bougies.

Episiotomy became an established procedure, and efforts to "avoid tears" were superseded by median or mesiolateral incision of the perineum during delivery. In conjunction with this immediate perineorrhaphy follows, the use of fine catgut (number o or oo plain or ooo chromicized sutures) being generally chosen. This was in line with the tendency to use finer instead of heavy suture materials in all types of surgical operations.

The Waters modification or revival of extraperitoneal caesarean section did much to eliminate the need for hysterectomy following caesarean section in neglected and infected cases. Such radicalism as the latter was no longer necessary, since the other afforded great protection.

Puerperium.—Infection ranked with haemorrhage as a leading cause of maternal deaths. Therapy by sulfonamides, penicillin, and streptomycin, all discoveries of the decade, served in reducing maternal mortality and morbidity. Penicillin was found effective in abating puerperal mastitis without abscess formation. Stilbestrol came into general use for relief of engorged breasts, often a precursor of actual mastitis.

Thrombophlebitis was successfully treated by intravenous injection of heparin, plus caudal "block" or injection of the spinal cord meninges with procaine hydrochloride, to produce the combined effect of lowered coagulability and relaxation of vasospasm, together with relief of pain and swelling.

Sterility.—Sterility or infertility continued to be in the foreground as a subject of research, attracting attention in North and South America and in England. Interest was actively aroused by the finding that many childless couples could be relieved. During the decade 1937–46, the study and relief of sterility became established on so routine a basis, and results became so good, that many gynaecologists took up this work with enthusiasm, the incidence of average correction and pregnancy ranging between 35 and 40%. This could be considered as one reason for the generally increased birth rate.

Office Gynaecology.—Office or ambulatory treatment of gynaecologic patients took on greater scope and importance. Sterility studies contributed because these were almost entirely office procedures. Various office treatments reduced hospital admissions and minor operations. The use of the thermocautery in cervicitis was an example; pelvic diathermy and thermal treatments for certain ailments including postoperative stages, the use of sulfonamides and penicillin in gonorrhea and syphilis, and the large field of endocrine disorders were other items in this progress.

Cancer.—Nothing outstandingly new was developed in either diagnosis or treatment of cancer (q.v.). Early diagnosis was still the important factor in effective treatment. The value of periodic pelvic examinations in respect to early diagnosis was convincingly demonstrated by Cather-

1938 and by Augusta Weber and her associates in Chicago, Ill., in 1943.

Endometriosis.—This disabling condition was said by V. S. Counseller to rank second in frequency among gyn-

ine MacFarlane and her associates in Philadelphia, Pa., in

V. S. Counseller to rank second in frequency among gynaecologic conditions encountered in the surgical pathology laboratory. At the beginning of the decade, it was still not common to diagnose this condition correctly in advance of operation.

Operative Technique.—Talcum powder used generally on gloves when being sterilized was found to interfere with wound healing, if gloves are not well rinsed off before use by the surgeon; irritating deposits of talcum crystals might be found persisting in wounds long after the operation.

The custom was established of sprinkling sulfathiazole crystals into infected operation wounds as a prophylactic expedient.

Smaller and smaller suture materials became favoured for closure of abdominal wounds, and some surgeons prefer nonabsorbable suture material such as silk, cotton, rayon or nylon.

The perennial debate regarding the relative advisability of total versus subtotal hysterectomy had not been settled. The proponents of total hysterectomy based their claim on the occasional occurrence of carcinoma in the stump of an amputated uterus. Its opponents pointed to the higher mortality rate from the more difficult total hysterectomy.

Urethrocele and stress incontinence continued to be troublesome conditions for which an old procedure, namely a fascial sling around the urethra at the neck of the bladder, was revived. This operation, utilizing a strip of abdominal fascia in either type as described, was always most effective and the reason for its not having been more generally employed was not clear. (See also DIABETES.)

Gypsum

The extensive use of gypsum as a building material led to small outputs for local use in scores of countries, but there were only a half a dozen which contributed important tonnages. World output was of the order of 13,000,000 short tons prior to World War II. Figures were

lacking for France, Germany and a few other fairly large producers. The trend of output by other major producers is shown in Table I.

Table I.—Major World Production of Gypsum

The war years had a marked effect on the gypsum industry in the United States. A feverish construction of army camps, industrial plants and housing boosted gypsum production from 3,058,116 tons in 1937 to a high of 4,788,534 tons in 1941. After the heavy rush of war building was over, production declined to 3,761,234 tons in 1944. Then there was much talk of a postwar boom in residential and commercial building, to bridge the gap of the war years, but this activity failed to develop to any great extent in 1945 so far as the gypsum output was concerned. Largely because of labour shortage, 1945 showed little improvement over 1944, and most of the increased supplies obtained came from expanded imports from Canada. Conditions showed some improvement in 1946; during the first half of the year the output of gypsum board, largest item in building use, increased 38% over the same period of 1945.

The United Kingdom, the second largest producer, had a declining output to 1940, but reconstruction of war damaged buildings led to subsequent increases to levels never before attained.

As in the United States, the Canadian output expanded to a high in 1941, and then declined sharply as demand for exports to the United States decreased. Exports began to increase again after 1943, bringing the Canadian output up to 822,380 tons in 1945, and to 499,150 tons in the first half of 1946. Australian production reached a peak of 206,548 tons in 1940, followed by a sharp decline to levels not experienced since the depression years of the early 1930s.

Haakon VII

King Haakon of Norway (1872-), was born Prince Charles of Denmark, second son of Frederick VIII (and brother of Christian X), on Aug. 3, 1872. Upon the separation of Norway from Sweden, he was elected king by the Norwegian storting (Nov. 18, 1905), and took the old Norse name of Haakon, and that of Olav for his son, the crown prince. Haakon married Maud (1869-1938), youngest daughter of King Edward VII of England.

Haakon, at 74 in 1946; was the youngest of the three

Scandinavian kings, and he had been forced to lead the most strenuous life in the tragic years of war. In the crisis of 1940 he maintained a calm courage even while being hounded out of Oslo by the German invasion and driven northward through Norway. He remained with the government until, by June 7, 1940 (the 35th anniversary of Norway's complete independence), further resistance within Norway had become impossible. He and the rest of the government then took ship for England, and set up in London one of the most effective of all the exile governments. He firmly refused the request of four members of the "presidential board of the storting" that he abdicate. His position was clear and secure, for the Norwegian constitution made definite provision for the possibility that king and ministers might have to leave the country and carry on from abroad.

Unusually intimate contact was maintained between the exiled leaders in London and the people at home in Norway; sabotage and guerrilla resistance to the nazis was effectively organized. The government likewise managed a first-class merchant fleet on the high seas and trained airmen and others in Canada and in England for the great job of reconquest. Haakon was the quiet, dependable rallying point for Norwegians everywhere, at home and abroad, on land and sea. He fully lived the motto he had chosen in 1905: "All for Norway."

When the Norwegians had lived through the bitter years of war and occupation, they gave Haakon a rousing welcome home again. His personal prestige was strengthened by his steadfast demeanour, his never-yielding fight and his quiet inspiration during the desperate years. Home again in 1945, he worked harder than ever to reacquaint himself with the problems and the personalities of his land.

(F. D. S.)

Hackworth, Green Haywood

Hackworth (1883-), U.S. jurist, was born Jan. 23, 1883, in Prestonburg, Ky. Educated at Valparaiso, Georgetown and George Washington universities, he was admitted to the bar in 1912. He served as attorney for the state department from 1916 to 1918 and as assistant solicitor from 1918 to 1925; in the latter year he was appointed chief of the legal office of the state department. In 1930 he participated in the codification of international law at The Hague, and in 1937 he was chosen to succeed Elihu Root on the permanent court of arbitration. Hackworth visited Moscow in 1943 as a member of the U.S. delegation to the tripartite conference. The following year he attended the Dumbarton Oaks conference in the United States. In Feb. 1946, he was elected judge of the International Court of Justice. Hackworth wrote the eightvolume Digest of International Law (1940-44).

Haile Selassie

Emperor Haile Selassie of Ethiopia (1891—), was born July 17, 1891, the great-grandson of Haile Melikot, king of Shoa. Selassie, whose name was Ras (Prince) Tafari Makonnen before he was monarch, became heir and regent to the throne in 1916 after his cousin, Zauditu, was proclaimed empress in that year. Gradually extending his power, he had himself proclaimed king in 1928, but did not formally ascend the throne until Nov. 2, 1930. He took the name Haile Selassie, meaning "Power of the Holy Trinity," and assumed the titles "King of Kings of Ethiopia, Conquering Lion of the Tribe of Judah, the Elect of God and the Light of the World."

Selassie secured admission of Ethiopia into the League of Nations in 1923 and two years later protested to the

League against the Anglo-Italian agreement of 1925, regarding spheres of influence in Ethiopia, as a violation of his country's integrity.

With regard to domestic problems, he worked cease-lessly to modernize Ethiopia, although progress was slow because of the country's backwardness. In 1931 he granted the country a constitution which provided for a bicameral parliament and responsible ministers. As the people lacked the education to use their new powers, real authority rested in his hands.

When Mussolini's legions invaded the country in 1935 and routed the Ethiopian troops, Haile Selassie was compelled to flee. On May 1, 1936, the Italians occupied Addis Ababa, and proclaimed King Victor Emmanuel III as emperor of Ethiopia. After British forces had liberated the country from Italian rule during World War II, Haile Selassie returned to Addis Ababa on May 5, 1941. Great Britain recognized his nation as a sovereign state on Jan. 31, 1942, and provided the emperor with financial aid to reconstruct his country.

Haiti

Haiti is a West Indian republic occupying the western third of the island of Hispaniola (also called Haiti or Santo Domingo). Various authorities have listed the area as 10,204, 10,695 and 10,748 sq.mi. Population estimates varied from 3,000,000 to 3,500,000; these widely quoted estimates had little or no basis in fact, as no census had ever been taken. The racial distribution was estimated to be 95% Negro and almost all of the remainder mulatto. An estimated 1,600 foreigners, approximately 575 of whom were North Americans, lived in the country in 1946. The population density of about 300 per sq.mi. was the greatest by far of any Latin American republic. The capital is Port-au-Prince (Pop. est., 125,000); other cities are Gonaïves (12,000), Les Cayes (15,000), Cap Haïtien (15,000), Jacmel (10,000), St. Marc (10,000) and Jeremie (8,000). The population is predominantly rural, only about onetenth living in urban communities. The official language is French, but a patois called creole, derived from Norman French of the 17th century, is widely spoken. Roman Catholicism is the official religion, though many persons in remote areas practice the folk religion of vodun or voodoo, with a large admixture of African elements. The traditional form of government is unitary, with a bicameral legislature composed of a senate and a chamber of deputies, a president elected by the two legislative houses meeting jointly as a national assembly and a judiciary headed by a court of cassation. Presidents during the decade 1937-46 included Stenio Vincent (to May 15, 1941); Elie Lescot (May 15, 1941-Jan. 11, 1946); military junta headed by Major Frank Lavaud in power after Jan. 11, 1946; Dumarsais Estime (after Aug. 16, 1946).

Border Massacre.—The density of population and the lack of development frequently led to emigration of Haitian peasant farmers for work on sugar plantations in the neighbouring countries of Cuba and the Dominican Republic. The Cuban government early in 1937 transported a considerable number of Haitian workers back to Port-au-Prince. A much more serious crisis arose with the Dominican Republic because of border clashes beginning in Oct. 1937 which quickly led to armed attacks on Haitians living on the Dominican side of the border. It was freely alleged that the attacks, which developed into the proportions of a massacre, were instigated, or at least condoned,

by Gen. Rafael Leónidas Trujillo, president of the Dominican Republic. The latter country, though with a much smaller population than Haiti, had been converted into a relatively powerful military state by Gen. Trujillo and clearly was militarily superior to Haiti, thus reversing the situation that had prevailed at various times in the 19th century, when Haiti either threatened or conquered the Dominican Republic. Official Haitian estimates placed the number of persons killed at 8,000, with a greater number wounded; unofficial, but normally reliable, estimates ran from 7,000 to 10,000 or more.

Haiti demanded an official investigation of the atrocities, which demand the Dominican government for a time resisted. The latter government, though it minimized the entire affair, undertook by an agreement of Oct. 15, 1937, to conduct an investigation in order to fix responsibility. After further incidents had been reported, the Haitian government on Nov. 12, appealed to the United States, Mexico and Cuba to use their good offices and to mediate. The Dominican government denied that any such need existed, and charged early in December that counterraids were being made from the Haitian side of the border. Haiti on Dec. 13 invoked the Gondra treaty, negotiated at the fifth Pan American conference at Santiago, Chile, in 1923, as well as later inter-American treaties, which provided for the appointment of commissions of inquiry. The question was ultimately submitted to arbitration under the Gondra treaty, and on Jan. 31, 1938, Haiti was awarded an indemnity of \$750,000, one-third to be paid in cash and the balance in annual payments of \$100,000. Ill feeling between the two countries continued for some time there-

Economic Uncertainty.-By contract with the Haitian government, the J. G. White Engineering corporation began in 1938 a broad program of public works, parts of which involved irrigation and drainage works, highway construction, etc. Economic uncertainty continued, however, although with more promise for the future than had been true previously. The agricultural program was marked by distribution of seedlings of coconut, lime banana, coffee and other plants, with the threefold objective of furthering diversification, extending the area under banana cultivation and improving the quality of coffee, the country's leading export crop. Exports increased in volume in the fiscal year ending Sept. 30, 1939, but had proportionately less increase in value. The outbreak of war in Europe had serious effects on Haitian trade, especially in so far as banana exports were concerned. The constitution, adopted in 1935, underwent several minor amendments in 1939.

Haiti's economic uncertainty crystallized during 1940 into an acute economic depression as the country began to feel the full effects of World War II. Coffee, the chief money crop and the main reliance of the small Haitian landholder, was especially hard hit, as the value of coffee shipments, normally half of the export total, declined by 45%. The government levied an additional export duty on coffee in an effort to bolster its shrinking revenues, but the chief effects were to impair materially the saleability of the commodity. A third of the crop was still unsold at the end of September. The inter-American coffee quota agreement in Nov. 1940 allotted 275,000 bags of 60 kilos each as Haiti's quota for export to the United States. This gave promise of some economic relief but did not provide for the full crop, estimated to be 400,000 bags for the 1940-41 season, especially as more than a third of the 1939-40 crop

had been sold in European markets now closed by the war. In practice, however, the basic coffee export quota assigned Haiti was regularly exceeded in shipments to the United States, sometimes by large amounts. Cotton might have served as a partial relief crop for Haitian farmers, except that following 1935 production had declined steadily because of the spread of the boll weevil, with quarantine and sanitary measures reported to have little effect on its control. The government continued its efforts to encourage sisal production.

The financial crisis in which the Haitian government found itself was alleviated in part by the United States agreement to dêfer a third of the interest payments due on Haitian bonds on April 1, 1941. A sharp subsequent rise in foreign trade so increased national revenues by September, however, that the deferred payments were liquidated entirely. The United States Export-Import bank made a loan of \$5,000,000 on May 1, 1941 to further the program of agricultural diversification, especially with regard to rubber production, spices and a variety of tropical medicines and fibrous plants.

The Société Haitiano-Américaine de Développement Agricole (S.H.A.D.A.) became in 1942 one of the most important factors in Haitian economic life. In Oct. 1942 S.H.A.D.A. signed an agreement with the Rubber Reserve company, a United States government corporation, for the planting of about 100,000 ac. of cryptostegia, a rubberproducing vine; this project was terminated, however, in 1944 as a result of the rapid expansion of the production of low-cost synthetic rubber in the United States. S.H.A.-D.A. also participated in a contract in May 1942, involving the White Engineering corporation, the Haitian government and the Export-Import bank, by which S.H.A.D.A. undertook to assume certain public works projects not yet completed by the engineering corporation. Haiti and the United States signed agreements in April 1942 which provided for the planting of 24,000 additional ac. of sisal, and a credit of \$500,000 extended by the Export-Import bank to the Banque Nationale de la République d'Haiti to maintain the gourde-dollar relationship.

Some Haitians feared even in 1943 that the emphasis on rubber production would lead to serious problems after the war; following a visit by President Lescot to the United States, this aspect of Haitian economy was covered by a Washington announcement, issued in November, that a study of postwar possibilities for small Haitian industry would be made, that an additional \$9,600,000 would be spent on the rubber project and that United States experts would be made available for advice on island problems. A United States sanitary commission (a unit of the Institute of Inter-American Affairs) was organized early in 1943 to work in close cooperation with the Haitian national health service. Haiti began large-scale work during the year under an agreement with the United States Commodity Credit corporation for the planting of 100,000 cuttings of derris root for the extraction of rotenone in preparation of insecticides. The republic also stepped up its production of loofa sponges and lignum vitae. Shipping to Haiti increased during 1943 with the lessening of the submarine menace in the Caribbean, and general economic conditions were hence better. War shortages continued to be felt, however; little newsprint was available for Haiti's 52 publications, and most newspapers were reduced to two pages. The government in March ordered goods to be moved by boat whenever possible; export of staple domestic foodstuffs was also prohibited in the same month.

Elie Lescot (right), president of Haiti, being greeted at Washington Oct. 14, 1943 by President Roosevelt and Representative Sol Bloom (left), chairman of the house foreign affairs committee. Mrs. Roosevelt is in the background. Lescot was ousted in a military coup of Jan. 1946 and went into exile in the United States

Politics, National and Hemispheric.—The principal political events in Haiti in 1941 centred about the presidential election. The constitution of 1935 had prohibited more than two successive terms for the president, but the national assembly in March unanimously reelected President Vincent for a third term and proposed a plebiscite to obviate the constitutional difficulties. Public opinion was strongly aroused, however, and expressed itself in mob protests. President Vincent hence stepped aside and Elie Lescot, Haitian minister to the United States for a number of years, was elected on April 15; he took office May 15, 1941. Haiti negotiated agreements with the United States in May and Sept. 1941 by which the latter country relinquished fiscal control in Haiti. Such control had extended back to a treaty which United States pressure had compelled Haiti to accept in 1916, although it had been partially surrendered in 1932-34. The functions formerly exercised by the United States fiscal representative were transferred in Sept. 1941 to the mixed council of administration of the national bank of Haiti, which became the property of the Haitian government. Following the Japanese attack on Pearl Harbor, Haiti promptly declared war on the major axis powers and immediately placed its facilities at the disposal of the United States. United States on Sept. 16 extended lend-lease materials valued at \$1,100,000 to aid in the development of Haitian

Throughout 1942 the Haitian government co-operated actively in connection with the hemispheric war effort. It extended the suspension of constitutional guarantees for the duration of the war, ordered all citizens outside of the republic to return and required all males between the ages of 18 and 40 to register in January. The government instituted controls over both axis property and the movement of United States currency. It also levied a defense tax of \$1 on each bag of the 1942-43 coffee crop to

finance defense measures. A department of national defense was created. President Lescot in March and April made a trip to Washington to confer with United States officials. Study of the English language became compulsory in Haitian schools on Oct. 1, 1942. The government early in the year introduced complete regulation of automobile, tire and gasoline sales. It also established price and export controls and created a special commission to supervise the production and sale of rice. The most important single control measure designated a number of articles as of primary necessity, including building materials, pharmaceutical products, wheat flour and lard, for most of which price ceilings were fixed and for which the government reserved the right to take up existing stocks to assure the most advantageous distribution. Cotton production was aided by a United States guarantee to purchase surplus

Haiti was responsible in 1944 for another example of the familiar Caribbean and Central American manoeuvre of continuismo (the extension of an incumbent president's term of office by constitutional amendment or adoption of a new constitution). The national assembly on April 19 amended 16 articles of the constitution, as a partial consequence of which the term of President Lescot, which was due to expire in 1946, was extended for five additional years, to May 15, 1951. Elections of senators, deputies and mayors were postponed until one year after the end of World War II, and the president was authorized to fill by appointment any vacancies occurring during that period. Another amendment empowered women to fill any of those three positions. The legal status of women was further improved by a decree-law in Jan. 1944 which improved their position in business and the professions by giving them title to their salaries after contribution of a proper share to the upkeep of the home. Naturalized citizens were granted full civil rights by the amended constitution. In spite of some evidences of popular dissatisfaction, President Lescot was inaugurated for his extended term on May 15, 1944.

Few developments of political importance occurred in 1945. The only disturbing incident was the announcement by the government on Aug. 13 that two men, sentenced to death in March for a conspiracy to assassinate

Pres. Lescot, had been executed. Five other persons were arrested for distributing leaflets against the government, and it was reported that military censorship was decreed June 17 in an effort to preserve public order.

Haiti took part in the Inter-American Conference on Problems of War and Peace at Mexico City early in 1945, and in the United Nations conference at San Francisco in the spring of that year. The national assembly on Aug. 8 unanimously approved ratification of the United Nations charter. A decree published on Aug. 27 ended censorship on correspondence both at home and abroad. The Haitian quota to the United Nations Relief and Rehabilitation administration's funds was set at \$40,000, with the understanding that the contribution would be increased later if possible. The government in December ratified a cultural agreement with Venezuela.

Gradual Economic Revival.—Prosperity returned to some extent in 1944. Increased shipping made markets available and higher prices brought greater returns. The banana industry especially demonstrated recovery both in the volume and value of exports, the more remarkable since a serious storm in the Artibonite valley in July 1944 destroyed more than a million stems on the limb, thus considerably reducing the harvest. After the abandonment of the cryptostegia rubber program in 1944, an expanded food production program was begun by the government with technical and financial assistance from the U.S. Office of Inter-American Affairs. The U.S. Foreign Economic administration entered into an agreement with the Haitian government to purchase corn, rice and beans, and the U.S. Commodity Credit corporation agreed to buy up to 250,000 lb. of rotenone roots in the period to May 7, 1946. The previously negotiated health and sanitation agreement was extended in October for a period of three years, with Haiti contributing \$150,000 and the United States twice that amount. The government on Feb. 25, 1944, expropriated axis assets, which had been frozen soon after United States entrance into the war.

The economic situation of the republic was characterized as fairly good during 1945 and 1946, although some shortages, such as newsprint, continued to be felt, and imports were still limited in quantity and variety.

Lescot Ousted.—The relative domestic calm which had characterized Haitian affairs for several years was shattered by events in Jan. 1946 which led to a violent change in the government. Disturbances broke out in Port-au-Prince early in the month, and in an effort to meet the situation, President Lescot resorted to a reorganization of his cabinet on Jan. 10. This action was followed the next day, however, by an army coup d'état, led by Major Frank Lavaud. which immediately forced the resignation of Lescot as president; he was exiled to Miami, Fla., on Jan. 14. The

revolt of Jan. 11 resulted in some fighting, with an estimated 14 dead and 100 injured. The army junta, headed by Major Lavaud, promptly pledged free elections for a legislative and constituent assembly, restoration of complete civil liberty and other democratic measures. The United States extended diplomatic recognition to the new regime on April 8. Elections for a new assembly were held May 12, 1946, with almost 1,000 candidates contesting for the 58 seats. It was obvious almost immediately after the election that the Democratic party, representing the mulatto ruling class, had won an overwhelming victory; the final results showed that that party had captured 56 of the 58 seats in the assembly. The body met first as a constituent assembly for the election of a new president and the drafting of a constitution to replace that of 1935. It was subsequently to be reorganized, with the same membership, as a legislative assembly. On Aug. 16, 1946, the assembly elected Dumarsais Estime, a member of the Democratic party, as president. Developments led some foreign observers to conclude that dominance of Haitian affairs by a small and unrepresentative minority of mulattoes in Port-au-Prince would continue indefinitely.

Halder, Franz

Halder (1884-), German army officer, started his army career as standard-bearer in a Bavarian artillery regiment and served as general staff officer during World War I. He was then attached to the office of the war ministry. General Halder was one of the early members of the nazi party at a time when other high-ranking army officers kept aloof from Adolf Hitler. In 1936 he became a lieutenant general and later that year chief of the general staff. Considered by many as Hitler's No. 1 strategist, he was said to have planned the Polish campaign, the blitzkrieg against France in the west and the initial drive into the U.S.S.R. in 1941. Halder was said to have talked sharply to Hitler and to have disagreed with him on several occasions on the conduct of the war, especially on a winter campaign in the U.S.S.R. and an invasion of England. He was passed up when Hitler bestowed the rank of field marshal on several of his colleagues. Halder was a close friend and associate of Marshal Walther von Brauchitsch and his chief of general staff until the latter was deposed in Dec. 1941. In Sept. 1942 Halder was assigned the task of developing plans for a second winter campaign in the U.S.S.R. but he was dismissed by Hitler in December. Implicated in the attempt against Hitler's life in July 1944, he was imprisoned until the defeat of Germany, when he was taken prisoner of war. He was charged with violations of the international law for the treatment of prisoners by the international military tribunal in Feb. 1946.

Halifax, Edward Frederick L. W., Earl of

The Earl of Halifax (1881-), British statesman, was born April 16, 1881, and was educated at Eton and Christ Church, Oxford. First elected to parliament in 1910, he retained his seat until 1925; in 1915-17 he served in France as a major, and in 1916-18 he was an assistant secretary to the minister of national service. In 1921 he was appointed undersecretary of state for colonies; in

1922 president of the board of education, in 1924 minister of agriculture and fisheries. From 1925 to 1931 he was viceroy of India. After holding various cabinet posts he succeeded Anthony Eden as foreign minister on Feb. 25, 1938, and retained this post through reshufflings of the war cabinets of Neville Chamberlain and Winston Churchill. He was associated with the policy of "appeasing" Adolf Hitler, and, until the actual outbreak of war, credited Hitler's professions of peace. After Sept. 1939 he repudiated his previous policy and urged a vigorous pursuit of the war.

Lord Halifax was named British ambassador to the U.S. on Dec. 23, 1940. Among the notable events of his ambassadorship were the signing of the British-U.S. lendlease pact in Feb. 1942 and the United Nations Relief and Rehabilitation act of Nov. 1943. Named British delegate to the San Francisco conference in March 1945, he attended the first sessions of the United Nations. His resignation as U.S. ambassador became effective on May 1, 1946, when he was succeeded by Lord Inverchapel.

Halsey, William Frederick, Jr.

Halsey (1882—), U.S. naval officer, was born Oct. 30, 1882, in Elizabeth, N.J. An Annapolis graduate, he commanded a destroyer patrol force in World War I and subsequently was commander of the aircraft carrier "Saratoga," commandant of the Pensacola naval air station, and, in 1938, commander of a carrier division.

Halsey led the attack against Japanese bases on the Marshall and Gilbert Islands on Jan. 31 and Feb. 1, 1942. On Oct. 24 he replaced Vice-Admiral Robert Lee Ghormley as commander of U.S. naval forces in the South Pacific. In recognition of his successful command in the battle of the Solomon Islands, he was promoted to full admiral on Nov. 20, 1942. His aggressive naval warfare was continued with the famous battle off Bougainville in Nov. 1943. On June 15, 1944 he was named commander of the U.S. third fleet in the Pacific. He supported General Douglas Mac-Arthur's land forces in the Leyte Island invasion of Oct. 1944, and together with the British routed the Japanese imperial navy in the battle for Leyte gulf. In Jan. 1945 his fleet assisted in the Luzon invasion, and in June and July it directed carrier attacks and shellings against the Japanese islands of Kyushu and Honshu. Admiral Halsey was present at the surrender ceremonies aboard the battleship "Missouri" on Sept. 2.

After his return to the U.S., Halsey relinquished his command on Nov. 22, 1945, and was relieved of active service. Promoted to the rank of admiral of the fleet in March 1946, he was appointed to the national defense council. In April he joined the Pan-American World Airways.

Hambro, Carl Joachim

Hambro (1885—), Norwegian statesman, was born at Bergen on Jan. 5, 1885, and was educated at Oslo university. In 1913 he became editor of the Oslo Morgenbladet, for which he had worked as a university student. In 1919 he was elected on the ticket of the Conservative party to the Norwegian storting, of which he became president seven years later. A fervent believer in the League of Nations, Hambro was elected president of the 1939 assembly which expelled the U.S.S.R. from membership in the League for its aggression against Finland. With the German occupation of Norway in April 1940, he was forced to flee the country and reached the U.S. in July of that year. In 1945, he was chairman of the Norwegian delegation at the San Francisco U.N. conference.

See TRACK AND FIELD SPORTS.

Handball

The sport of handball is sub-divided into two types of games, one-wall and four-wall. While the one-wall game continued to be played almost exclusively along the eastern seaboard of the United States, it was the four-wall game which had been played for years. The latter had evolved on a standardized basis in various countries, and in the United States truly attained national prominence and interest. The classic event of the four-wall game in the United States continued to be the annual tournament held under the auspices of the Amateur Athletic Union.

During the decade 1937-46 there was one outstanding competitor, Joseph P. Platak, who retained in 1937 the title he had won in the previous two years, and was returned the victor six times after 1937, a record unequalled in the history of the sport. In doubles, the New York Athletic club team of Frank Coyle and Edward Linz carried off first honours four times, also a record.

In the one-wall play, the principal competitors and best players originated in New York, and all the national tournaments were held in that city. A feature of the onewall game, unlike four-wall, was the interest created among women players.

A list of the winners for the various classes during the ten-year period follows:

National tournaments in other branches of the sport were not held in 1943, 1944, 1945, or 1946. (Fr. Ro.)

Handy, Thomas T.

Handy (1892—), U.S. army officer, was born March 11, 1892, in Tennessee, Graduated from the Virginia Military institute, Lexington, Va., in 1914, he specialized in artillery courses at several army war colleges and was a second lieutenant during World War I, rising to the rank of major. He was an honorary graduate of the Command and General Staff school in 1927 and was graduated from the Army War college in 1935, and the Naval War college in 1936.

During World War II, Handy was commanding officer of a field artillery battalion (armoured) 1940–42, and was assistant chief of staff in charge of operations in the war department, 1942–44. On Oct. 22, 1944, he was appointed deputy chief of staff, succeeding Gen. Joseph McNarney, who had been transferred to the Mediterranean theatre. A month earlier, Handy had been promoted to the rank of temporary lieutenant general. His appointment as a full general (temporary) was confirmed by the senate on March 28, 1945, and he was named for promotion to the rank of permanent major general on Jan. 22, 1946.

546 Hannegan, Robert Emmet

), U.S. politician and cabinet Hannegan (1903member, was born June 30, 1903, in St. Louis, Mo. He took his law degree at St. Louis university in 1925, and started his political career in 1933 as a Democratic committeeman of a St. Louis ward. By the end of 1933, he had become chairman of the city central committee and an important figure in the Democratic political machine. During the era of vote fraud investigations in St. Louis and the state of Missouri, Hannegan and some of his followers were accused of being involved in ballot-box stuffing. Hannegan promptly countered with accusations that the Republicans had engaged in fraudulent voting operations themselves. Although the charges were never cleared, the political machine controlled by Hannegan and Mayor Bernard F. Dickmann of St. Louis was defeated in April

In May 1942, Hannegan was proposed by Harry S. Truman, then U.S. senator for Missouri, and appointed by Pres. Roosevelt to the post of collector of internal revenue of the eastern district of Missouri. He was appointed commissioner of internal revenue in Washington, D.C. in Oct. 1943, and became chairman of the national Democratic committee in Jan. 1944. At the Democratic national convention in July of that year, Hannegan was influential in obtaining Truman's nomination for the vice-presidency. He was appointed postmaster general of the U.S. by President Truman in 1945.

Hanson, Richard Burpee

Hanson (1879—), Canadian legislator, was born March 20, 1879, in St. Andrews, New Brunswick, and received his law degree from Dalhousie university in 1901. He practised law in Fredericton, N.B., for a number of years and was active in municipal politics, as mayor from 1918 to 1920 and as city solicitor from 1920 to 1926. He was elected to the house of commons in May 1921, but parliament was dissolved before he took his seat. He was re-elected later that year, and again in 1925, 1926 and 1930, but was defeated in 1935. From 1934 to 1935 he was minister of trade and commerce in the Bennett cabinet. As leader of the opposition (Conservative) party from May 1940 to Jan. 1943, he was particularly noted as an opponent of the draft bill.

Hansson, Per Albin

Hansson (1885-1946), Swedish statesman, was born Oct. 28, 1885, in the province of Scania, Sweden. His formal education was brief, consisting of a short period in a public school. At the age of 24, he became editor of the newspaper Fram, and a delegate to the junior branch of the Social-Democratic party. In 1914, he joined the editorial staff of the official party paper, Socialdemokraten, and by 1917 he was managing editor. Elected in 1918 to the second chamber of the Swedish Riksdag on the Social Democratic ticket, he became minister of defense. Despite his strong antimilitaristic convictions, he continued to serve in this dual capacity, with only brief interludes, until 1926. In 1932, he was elected prime minister and continued throughout World War II in this post. With the start of that conflict, he directed all of his efforts toward maintaining the neutrality of Sweden.

On Dec. 13, 1939, a coalition cabinet was formed under Hansson's leadership. By May 1940 he declared that Sweden would not sanction the use of its territory by belligerents. In June 1941, however, his government acceded to a German demand for passage across Sweden of a division of soldiers from Norway to Finland. As the war progressed, he demanded absolute preparation for defense against aggression and on Jan. 18, 1943, stated emphatically that Sweden, if attacked, would fight. Two months after the end of the European conflict (July 1945), the premier and his cabinet resigned and a new Social Democratic government was formed with Hansson still its leader and prime minister. He died at Stockholm, Oct. 5, 1946.

See RIVERS AND HARBOURS

Harper Prize Novel

See LITERARY PRIZES.

Harriman, W. Averell

), U.S. diplomat and business Harriman (1891executive, was born Nov. 15, 1891, the son of E. H. Harriman, railroad magnate. On his graduation from Yale university in 1913, he carried on in his father's enterprises, eventually becoming chairman of the Illinois Central and Union Pacific railroads, as well as a partner in Brown Brothers, Harriman and company. Entering government service during President Roosevelt's first term of office, he served as an NRA administrator, as a member of the business advisory council of the department of commerce, and as director of the raw materials division of the Office of Production Management. In March 1941, he was sent to Great Britain as lend-lease representative, with the rank of minister. He went to Moscow in Sept. 1941 as the head of the American delegation of a U.S.-British joint mission and again in Aug. 1942 at the time of the Stalin-Churchill conferences. Named ambassador to the U.S.S.R. on Oct. 1, 1943, he participated in every major international conference of World War II. On Feb. 14, 1946, he resigned as Moscow ambassador, and on April 10 succeeded John Winant as ambassador to London.

Harris, Sir Arthur T.

Sir Arthur Harris (1892-), British air officer, was born April 13, 1892, in Cheltenham, England. Educated in English public schools, he enlisted during World War I and joined the royal flying corps in 1915, later commanding several squadrons on the western front. He was made an air commodore in 1937, air vice-marshal in 1939, and commander in chief of the R.A.F. bomber command in Feb. 1942. A firm believer in mass raids, Air Marshal Harris developed the "saturation" technique of mass bombing -that of concentrating clouds of bombers in a giant raid on a single city with the object of demolishing it. He applied this method with great destructive effect on axisoccupied Europe from 1942 to the end of World War II. He resigned his command in Sept. 1945, and was awarded the D.S.M. by the U.S. the following November.

Hart, Thomas Charles

Hart (1877—), U.S. naval officer and senator, was born June 12, 1877, in Davidson, Mich. Graduated from Annapolis in 1897, he served in the Spanish-American War and was a commander of submarines in World War I. He was made a rear admiral in 1929 and took command of the Asiatic fleet in July 1939. When the U.S.-Japanese war broke out in Dec. 1941, he was compelled to take up defensive positions in Philippine waters, since the Asiatic fleet was a comparatively light naval force. On Jan. 3, 1942, Adm. Hart was made commander of Allied naval

forces in the Southwest Pacific, but was succeeded by Vice-Adm. C. E. L. Helfrich of the Netherlands navy on Feb. 11. Although placed on the retired list as admiral in July, he was retained on active duty and was appointed to the navy general board. He participated in the trial of Rear-Adm. Kimmel and in the investigations of the responsibility for U.S. unpreparedness at Pearl Harbor. In Feb. 1945 he was chosen by Gov. Raymond E. Baldwin and the Connecticut senate to fill a U.S. senate vacancy. Sitting as a Republican, he opposed the Bretton Woods bill, defended the navy's role at Pearl Harbor, and opposed merger of the U.S. armed services.

Harwood, Sir Henry Harwood

), British naval officer, Sir Henry Harwood (1888– was born Jan. 19, 1888. Entering the royal navy as a cadet at the age of 15, he became a lieutenant in 1908. For two years he served in China and during World War I was torpedo officer on various ships. Promoted to the rank of commander in 1921 and captain in 1928, he joined the staff of the Royal Navy War college in 1934. As commander of the "Exeter" in 1936, he was commended by the governor-general of Trinidad for his part in suppressing the disturbances of that year. In 1939 he led the action against the German pocket battleship "Graf Spee," which was scuttled in the outer harbour of Montevideo, Uruguay; for his distinguished conduct in this battle, he was promoted to the rank of rear-admiral. Sir Henry was appointed lord commissioner of the admiralty and assistant chief of naval staff in 1940.

He became commander in chief of the Mediterranean fleet in 1942 and of the Levant fleet in 1943, with the rank of vice-admiral. Because of ill-health he relinquished his position in April 1943, and retired from the royal navy in Nov. 1945.

Haushofer, Karl

Haushofer (1869–1946), German geopolitician, was born Aug. 27, 1869, in Munich. He joined the German army as a youth, later became military observer in Japan and commanded a division on the western front in World War I. After the armistice, he became professor of political geography at the University of Munich, and there advanced a theory of geopolitics which he asserted would enable the reich to regain its former status as a world power. (See Geopolitics.) Haushofer was taken into custody by U.S. military authorities in Frankfurt-on-Main in June 1945 and later released. At that time, he said that he had quarrelled with Hitler in 1938.

He also denied reports that his ideas had carried any weight with the fuehrer and declared that he had spent six weeks in the Dachau concentration camp. Haushofer and his wife committed suicide at their Bavarian home, March 10, 1946.

Hawaii

The U.S. territory of Hawaii consists of a group of eight large islands and numerous islets near the centre of the North Pacific ocean, with a total land area of 6,441 sq.mi. The eight islands, of volcanic origin, are Hawaii, Kahoolawe, Maui, Lanai, Molokai, Oahu, Kauai, Niihau. The largest and the youngest geologically is Hawaii, with an area of 4,030 sq.mi. The capital of the territory is Honolulu, situated on the island of Oahu, with a population of 179,326 (1940 census), exclusive of military and naval personnel. The population of the territory in 1940 was 423,330 and had expanded to an estimated 502,122 in 1945, exclusive of military and naval personnel. The racial origin of this population, in addition to the native Hawaiians and the Caucasians from the mainland, is Japanese, Chinese, Korean, Filipino, Portuguese. However, 86% of the population is native born.

Ingram M. Stainback took office as governor on Aug. 24, 1942, and was reappointed July 13, 1946.

Joseph R. Farrington was territorial delegate in congress in 1946.

In 1946, congress appropriated funds to set up, under the division's director, Edwin G. Arnold, a Pacific branch within the division of territories and island possessions, U.S. department of the interior. The branch was established to fulfil the responsibilities of the division for the territory of Hawaii, to carry out administrative duties within the jurisdiction of the department for that area, and to assist the Hawaiian people in every way possible in their progress toward eventual self-government.

The Question of Statehood.—The report of the congressional joint committee's findings on statehood for Hawaii in Feb. 1938 marked the high point to that date in 35 years of effort to obtain treatment for the territory equal to that of the states and recognition of the islands as an incorporated territory of the union and an integral part thereof.

More progress toward statehood was made in 1938 than in all the twoscore years since the voluntary annexation of the islands to the United States. U.S. citizens in Hawaii comprised, on June 30, 1939, more than 80% of the entire population of the territory for the first time in the two-score years since annexation.

This figure would have been higher by nearly 10% had the non-citizen Filipino "nationals" not been classified as aliens.

Meanwhile, on the mainland, the Equal Rights commission had been effecting broader dissemination of the true picture of the islands as one of the necessary steps leading to statehood.

As a result, only 39% of the clippings received from mainland publications erroneously referred to the territory as an insular possession, a colony or as a "foreign country," as opposed to a figure of 89% two years before.

In Jan. 1946, hearings on the subject of statehood for Hawaii were opened in Honolulu by the subcommittee on statehood of the committee on territories, house of representatives. More than 100 witnesses were heard on the 5 major islands.

The committee recommended that the committee on territories give immediate consideration to legislation to admit Hawaii to statehood.

Ingram M. Stainback, governor of Hawaii, appointed a Citizens' Statehood committee to promote and support the cause of early statehood for Hawaii. The committee, guided by an executive board of 17 members, was composed of 280 members, including the legislature, Equal Rights commission, county government heads, representatives of civic organizations and individual citizens. The governor was

Natives of Honolulu watching an emergency hospital burning Dec.
7, 1941, after it had been struck by Japanese high-explosive and incendiary bombs

chairman. Many resolutions favouring statehood for Hawaii were passed unanimously during the year at national conventions on the mainland.

A plebiscite on the question of statehood for Hawaii was held in the territory in 1940; the vote was 67% in favour of statehood. Members of the Lions International Service club of Honolulu in a straw ballot voted 85 to 9 in favour of statehood.

The Japanese Attack.—At 7.55 A.M. on Sunday, Dec. 7, 1941, scores of Japanese planes bombed military installations at Pearl Harbor, Hickam field, Wheeler field, Schofield barracks, Kaneohe naval air station, Bellows field. and sporadically, the city of Honolulu itself. At 8.25 A.M. and at 9.10 A.M. the invaders again renewed attacks. A third attack at 1050 A.M., aimed particularly at Pearl Harbor, was repulsed with heavy loss to the invaders. Japan lost 3 submarines and 41 planes in the attack. Civil-1an casualties numbered 49 dead and many injured. Verified reports later set U.S. personnel losses at Pearl Harbor as 2,340 officers and men killed, 946 wounded. The governor of Hawaii issued a proclamation suspending the privilege of the writ of habeas corpus and declaring martial law. General Walter C. Short issued a statement that martial law had been proclaimed. A military government was set up, exercising executive, judicial and legislative functions. That night, under orders of the military governor, a complete black-out of all lights in the territory between sundown and sunrise was made effective. Provost courts, under martial law, supplanted the district or police courts throughout the territory. The Hawaii chapter, American Red Cross, swung into immediate action. The

Office of Civilian Defense dispensed approximately 1,000 doses of blood plasma following the attack. In addition to emergency meals, the OCD food division stored thou sands of full ration meals at medical aid stations and in school cafeterias

Throughout the early months of 1942, military precautions continued. The military governor of Hawaii ordered new black-out restrictions which provided that no persons, other than those on official business, could be on the streets, highways, parks or beaches, on vehicles or on foot between 6 P.M. and 6 AM. Carrying of lighted cigarettes, cigars or pipes, or the striking of matches in the open during the black-out was forbidden. As a precaution against air attack on the congested area near the water front, the office of the military governor urged that women and children living in the downtown districts move immediately to safer areas. Over 450,000 individuals were fingerprinted and cased for personal history, immunization of the whole population against smallpox and typhoid was completed The population was supplied with 400,-000 adult gas masks, 70,000 built-up masks for children and 32,000 bunny masks for infants.

Guy J Swope, director of the division of territories and island possessions, department of the interior, arrived in Honolulu to put in motion the administration of the federal \$15,000,000 civilian defense fund grant to Hawaii. Persons in the territory could not withdraw more than \$200 a month in cash from banks or other financial institutions. Possession of more than \$200 in currency at any one time by an individual also was prohibited. All U.S. currency in the territory was replaced by U.S. currency on which appeared the overprint "Hawaii."

The Tension Eases.—By 1949, however, the danger of invasion or concentrated air attack had apparently passed. The White House issued a statement saying that an agreement had been reached in Washington for a substantial restoration of certain government functions in Hawaii to the appropriate civilian authorities. Martial law remained in effect, however, and the writ of habeas corpus continued to be suspended. Proclamations were issued by the governor of Hawaii and the commanding general restoring to civil authority the management of civil affairs as of March 10, 1943. Edward J. Ennis, special assistant to U.S. Attorney General Francis Biddle, announced in Honolulu after a lengthy investigation that the ban on issuance of writs of habeas corpus for persons held by the military in Hawaii would stand. Secretary of War Henry L. Stimson announced that the army would accept enlistments by American-born Japanese, many in concentration camps, and train them on the mainland as separate army combat units. The first group of more than 2,600 U.S. citizens of Japanese ancestry sailed from Hawaii as volunteers to train at Camp Shelby, Hattiesburg, Miss., after ceremonies attended by nearly 20,000 persons.

Opposition to Martial Law.—Strong opposition to the practice of trying civilians in provost courts was expressed by leading members of the Bar association of Hawaii. Judge Delbert E. Metzger rejected testimony of Adm. Chester W. Nimitz and Lt. Gen. Robert C. Richardson that martial law was still necessary and ruled in federal court, Honolulu, in 1944 that military government in the Hawaiian Islands was invalid. Army headquarters said the ruling would be appealed and that meantime the office of military governor would function as usual, and violations of general orders would continue to be tried in provost

Thousands of U.S. troops of Japanese ancestry massed at Honolulu, Hawaii, in April 1943, before leaving for the U.S. to receive military training

courts. Later, Lt. Gen. Robert C. Richardson, commanding army forces in the central Pacific area, announced he had voluntarily dropped the title of military governor of the territory. President Roosevelt, in Oct. 1944, announced suspension of martial law in Hawaii and restoration of habeas corpus. The military was to have control only of defense measures in the islands.

In 1946, the U.S. supreme court ruled 6 to 2, Justices Burton and Frankfurter dissenting, that military courts

set up under martial law in Hawaii during the war period had no power to try civilians.

Seismic Wave.—On April 1, 1946, an underwater earthquake near Dutch Harbor, Alaska, sent huge seismic waves which reached an estimated speed of 303 mi. per hour sweeping the Hawaiian Islands. Hawaii reported 10,000 homeless, estimated property damage of \$10,000,000 and a toll of 123 persons killed and 50 missing. The city of Hilo on the island of Hawaii was particularly damaged. President Truman signed a bill Aug. 9 appropriating \$16,300,000 for the relief of the wave victims.

Hay

The production of tame hay in the United States increased gradually up to World War I, and the crop reached the high record to that time of more than 81,000,000 tons in 1917. Production then trended downward until a low point in 30 years was reached in 1934, when the crop was only 55,270,000 tons. Later, production increased steadily to a record crop of tame hay, 92,204,000 tons, in 1942. Wild hay production was 7,322,000 tons in 1937 and increased to 13,378,000 tons in 1945. Together, tame and wild hay made a total of 83,035,000 tons in 1937 and 105,292,000 tons in the good year 1942.

The gradual expansion of acreage continued during the period between World Wars I and II-from 1919 to 1939. Some new kinds of hay became more important. Alfalfa gained steadily, mixed clover and timothy declined, soybean, cowpea and lespedeza gained rapidly after 1930. The total acreage of all tame hay was 53,943,000 ac. in 1937 and 59,905,000 ac. in 1945. Wild hay for the same period increased from 12,073,000 ac. in 1937 to 14,311,000 ac. in 1945. The proportions of the kinds of hay crops did not vary greatly during the decade 1937-46. The distribution in 1940 was generally typical of the period, as follows: Alfalfa 30,719,000 tons; mixed clover and timothy 26,750,000 tons; sweet clover 90,700 tons; lespedeza 5,058,000 tons; soybean 656,000 tons; cowpea 1,711,000 tons; peanut 1,092,000 tons; grains cut for hay 4,346,000 tons; miscellaneous 8,517,000 tons; and wild hay 9,700,000 tons. The greatest increases in kinds of hay had been in lespedeza, which became popular in the middle south and doubled its production after 1937. More peanut vine hay was cut during the war years chiefly because of expansion of the crop for nuts.

Other states produced less than 500,000 tons. *Preliminary estimate.

Methods of hay harvesting changed during the decade as new machines were developed. The tractor had led to the practice of baling hay in the field as it was cut with the new type pickup balers. For barn curing the new haydryer equipment was installed in many dairy barns to improve the quality of the cure and permit quicker handling in the field with less loss from weather damages. A serious shortage of baling wire developed in 1945 and 1946 because of Office of Price Administration restrictions on steel allotments and prices. Many farmers were forced to use twine. The limitations on the output of having machinery, critically needed by farmers because of the labour shortage in the war years, was also a cause of much complaint and had serious effects in many cases. The quality of hay is greatly affected by the time when it is cut and the manner in which it is cured. The feeding value can be increased 25% by cutting at the right stage of maturity. In some areas the shortage of labour and machinery delayed hay harvest so that 40% of the crop

was damaged.

Prices of all hay were steady from 1937 to 1940 at a national average farm price of about \$8 per ton. In 1941 the feed demand was reflected in hay prices and the average rose to \$10.76, in 1943 to \$14.80, 1944 to \$16.40 and in 1946 declined to about \$15 per ton. Alfalfa No. 1 baled in the Kansas City, Mo., market ranged from \$13.58 per ton in 1938 to a top of \$29.08 per ton 1943. Prices generally declined in 1945 and 1946 as the feed shortage became less acute and hay stocks were large. Farm stocks were the largest in ten years except for 1943. The U.S. department of agriculture estimated that a 20% increase over the tame hay acreage during 1937-41 should be raised in the postwar period and called for a 5% increase over that average for 1946. The southern states were urged to expand acreage. Hay had become a more important form of livestock feed than was generally thought. It was estimated that before World War II hay and pasture accounted for more than 50% of the feed for all livestock (90% for sheep, 70% for beef cattle and 60% for dairy cattle, horses and mules). Production of hay in 1945 was high in relation to the number of livestock to be fed. The proper fertilization of meadows increased yields in a number of areas.

Hayseed.-The acreage of hay harvested for seed increased steadily during the decade 1937-46. Seed was so scarce that a price supporting program was introduced by the government in 1942. With the shortage of labour, seed production was favoured, since it requires less labour and at the advanced prices was as profitable as hay raising. By 1944 the six principal legume and grass seeds reached 550,800,000 lb., 31% above 1943 and 38% above the tenyear average. Seed prices were high and the weather favourable for harvesting seed. The crops of 1945 and 1946 were also large but not up to the high record of 1944. The amounts of each of the principal seeds in the crop of 1944 were: Alfalfa 1,124,900 bu., about 7% below the ten-year average because of low yields; red clover 1,734,600 bu., 45% larger than the average; alsike 221,500 bu.; sweet clover 644,200 bu.; lespedeza, a record crop of 267,700,000 lb., two and one-half times the ten-year average production; timothy 1,323,700 bu.; redtop 17,-300,000 lb.; sudan grass 61,300,000 lb. Considerable quantities of grass seeds were sent abroad for relief for farmers in devastated regions. Under the Federal Seed act, imports were strictly controlled. Alfalfa seed imports increased from 4,590,000 lb. in 1937 to 11,508,000 lb. in 1941. Sweet clover seed imports were maintained, but most varieties declined in quantity of imports. Heart and Heart Diseases

The most important advance in knowledge of the normal heart during the decade 1937–46 was the recognition of the wide range of its anatomical and physiological attributes. It still remained for anthropometrists to construct tables, nomograms and standards for the definition of what is normal for any given person based on his body build and manner of life. Until that time, the physician had to continue securing for future comparison cardiovascular data of any prospective patient while he or she was still in good health. Serial records of a given individual remained of much greater value than the use of current tables of the range of the normal by any kind of examination based on weight, height and age.

World War II added somewhat to evaluation of exercise tests, but no startlingly new methods resulted. The twostep test, route marching and the score of the Schneider index were found most practicable for the estimation of general physical fitness as well as of cardiovascular reserve. The inhalation of limited oxygen (10%) revealed coronary insufficiency in some patients in whom the diagnosis was clinically obscure; angina pectoris or characteristic electrocardiographic changes might be thus induced on occasion, but careful critical interpretation of the results was needed in every case.

X-ray study of the heart and great vessels became more expert. It was still difficult or impossible to determine, except by careful serial records, the beginning of enlargement of the heart-one of the most important of all evidences of serious heart strain. The injection of radiopaque substances, in particular diodrast, into veins and arteries became a well-established procedure for the diagnosis of a good many obscure cases, in particular congenital anomalies of heart and great vessels. In the so-called tetralogy of Fallot, the diodrast enters the aorta from the right ventricle before it appears in the left ventricle. The commonest method was still injection of the contrast material into one or the other brachial vein to outline the great veins and right heart first, but skill, well-organized technique and experience were needed to get good results and to avoid disagreeable reactions. In doubtful cases of leg vein inflammation and obstruction, diodrast injections were also utilized, but again much experience was needed; not infrequently the interpretation was difficult, and sometimes the very procedure itself might cause phlebitis (inflammation of the veins). Even aortic injections were made to study the renal circulation, but this was still a new and experimental procedure. Kymography, which photographs the heart shadow in systole and in diastole, could on occasion reveal the paradoxical pulsation of a heart muscle scar (myocardial infarct) but fluoroscopy (visual X-ray study) also showed this.

Electrocardiography, which records the electrical activity of the heart, advanced considerably during the decade in two particulars: (1) the establishment of the importance of patterns and (2) the exploration of the heart by leads placed directly on the chest in addition to the usual limb leads. Originally, in the early 20th century, the electrocardiograph was essentially limited to the study of fast, slow and irregular heart action. During the decade 1937–46, there was full recognition of the more or less specific patterns for certain conditions such as (1) damage to the heart muscle in the anterior or posterior wall of the left ventricle caused by acute coronary artery thrombosis, (2) strain of the left ventricle because of high blood pressure

or aortic valve disease, (3) strain of the right ventricle chronically from mitral valve disease, obstruction of the pulmonary circulation (cor pulmonale) or certain congenital heart defects, and acutely from massive pulmonary embolism (acute cor pulmonale) and (4) pericarditis, acute or chronic

The other important advance, the recording of electrocardiograms with an electrode placed on the chest wall directly over various parts of the heart, yielded much information concerning the localization of heart muscle damage and of heart chamber strain; it was still in the stage of further development in 1946.

Other newer methods of examination were under investigation. Thus, catheterization of the heart via the arm veins revealed or confirmed certain congenital anomalies in two ways: (1) the catheter could be seen by fluoroscopy to pass through septal defects or into the aorta from the right heart and (2) the analysis of blood gases, in particular oxygen, revealed shunts, as for example, when there was much more oxygen than normally present in the right auricle when arterial blood entered it from the left auricle through a septal defect, or in the right ventricle due to the passage of blood from the left ventricle, or in the pulmonary artery resulting from blood flow through a patent ductus arteriosus. Even the renal vein could be quite readily catheterized via an arm vein (and the superior and inferior venae cavae) in the study of kidney blood flow.

Another special method of examination, still wholly in the experimental stage, was ballistocardiography—the recording of the jarring of the body by the impact of blood in the aorta with each heartbeat; it is essentially a mechanical pulse record of a special sort. The subject lies on a carefully and delicately balanced table, the vibrations of which are transmitted by mirror and beam of light to a moving photographic film. An attempt was made to utilize the ballistocardiogram as a means of measuring the cardiac output per beat but this was crude and required much correction; it was better to regard ballistocardiography as a method of study per se which might or might not eventually prove to be of some clinical value.

The old established techniques, improved by refinement—history taking and physical examination with expert auscultation and interpretation of heart sounds and murmurs—remained by far the most important part of the study of any individual case, making up at least 80% of the total diagnostic aids.

Incidence of Heart Disease.—During the decade, more accurate but still inadequate calculations were made of the incidence of heart disease in toto, and particularly of the relative incidence of the different kinds of heart disease in various parts of the world. There was confirmation of the infrequency of rheumatic heart disease in the tropics, and yet it had been found even in the South sea islands. Hypertension, once thought rare in China, was found there not infrequently. Angina pectoris caused by disease and insufficiency of the coronary circulation was found the world over. What remained to be determined was the relationship of the different kinds of heart disease to ways of life, which required extensive detailed studies of total populations; hospital, insurance and group analyses were not enough.

Congenital Heart Disease.—The greatest advance of all was in the better understanding and treatment of congenital cardiovascular defects, an extremely difficult field much neglected previously. A ray of light was thrown on the aetiology about which there were hitherto only theories; the Australians N. M. Gregg and C. Swan discovered that

German measles during the first two months of pregnancy is likely to lead to a combination of defects in the foetus so that at birth congenital cataracts, microcephaly and congenital heart disease are found; the cardiac lesions noted were patency (remaining open) of the ductus arteriosus and ventricular septal defect. It was even suggested that the hazard is so great that early termination of pregnancy is in order.

The second noteworthy advance was in diagnosis, doubly important now that operative relief or even cure had become possible in some cases. It became essential for the average doctor to be able to recognize patency of the ductus arteriosus so that he might submit patients with this defect to the specialist or even directly to an expert surgeon for ligation without sending patients for long distances who had a different and (in the prevailing stage of knowledge) inoperable condition, such as an auricular septal defect, with which patency of the ductus arteriosus was still often but unnecessarily confused. The pathognomonic sign of ductus patency is a continuous murmur heard with the stethoscope in the pulmonic valve area. Similarly, there were clear clinical proofs of three or four other fairly common and important congenital defects of the heart and great vessels, in particular ventricular septal defect, auricular septal defect, coarctation of the aorta and the cyanotic type of defects, the commonest example being the tetralogy of Fallot. The X-ray and electrocardiograph greatly aided in the development of ability to diagnose these conditions.

The third great advance was in surgical therapy, already mentioned. More exact structural diagnosis became essential. In addition to correction of patency of the ductus arteriosus, it had now become possible in some cases of the cyanotic type to divert a sufficient quantity of the blue blood from the general systemic circulation to the lungs for oxygenation by most ingenious and delicate arterial anastomosis (of innominate or subclavian artery to one of the pulmonary arteries) to improve greatly the colour and vitality of the young children so operated upon. Also the coarcted or narrowed aorta had now been attacked by excision of the affected part and a suturing together of the clamped and cut ends of the aorta above and below. Lively and fruitful interest was focused during the decade on this one relatively small field of heart disease.

Rheumatic Heart Disease.-Doubtless the most important advance in knowledge of rheumatic heart disease in the decade came in the recognition of the need for distinguishing the acute phase from the chronic. In the majority of cases acute rheumatic fever evolves into the chronic form. In many cases, however, all evidence of cardiac involvement disappears (a part of the vital concept of the reversibility of heart disease). Occasionally the acute process recurs superimposed on chronic valvular disease. The majority of deaths in young rheumatic heart cases is primarily due to the acute involvement of the myocardium (heart muscle) by rheumatic inflammation, sometimes during its initial attack but more often due to a flare-up or recurrence. And it is of great importance to note that involvement of the muscle is much more important in such cases than involvement of either the heart valves (endocardium) or the pericardium (lining the sac in which the heart lies). It is this fact that explains much of the cardiac enlargement and of the murmurs in many cases, the subsidence of which was once veiled in mystery and not infrequently disputed even among the experts.

Another well-recognized fact was the dependence of activity of the rheumatic state on the degree of vitality of haemolytic streptococcus infection in any given community

or part of the world or circumstance, such as the herding together of many susceptible young men for military training in the Rocky mountain section of the U.S. The rheumatic process itself still remained a mystery and had no antidote as yet, although some of the symptoms, in particular joint pains and fever, were alleviated and even controlled by salicylates, the specificity of which was occasionally reported but not confirmed.

Moreover, the acute process might remain active for a long time, even for years, if there were recurrent exacerbations, though the usual duration is of some months; it is probably the best policy to keep the victims at rest during this period not only because of evidence of an acute "infectious process" but also because of the fact that the heart itself is involved with the danger of the increase or persistence of cardiac dilatation if much effort or excitement is superimposed on the myocardial strain due to the inflammation itself. Inconclusive experiments were in progress during the decade on prevention of rheumatic fever through control of haemolytic streptococcus infections by sulfonamide rations throughout the winter and spring months; favourable results were reported, but there were two chief reasons why such prophylaxis was not advisable on a wholesale scale but was rather to be reserved for susceptible individuals: (1) the sulfonamides might themselves cause harm by their toxic effects and might even produce myocardial damage and (2) sulfonamide-resistant strains of haemolytic streptococci might be developing which in the end could more than neutralize the early, apparently favourable, results. Also it should be observed that neither the sulfonamides nor penicillin have any therapeutic value in the case of the rheumatic process itself.

The question of seeking a more favourable climate for residence by "rheumatic" families was another matter of much concern; other things like occupation, schooling and happiness being equal, such a step could be worth while, but the protection was by no means complete and families separated by such a measure might become unhappy. This extensive and depressing disease continued to rank first as a cause of death and disability in the second decade of life.

Subacute Bacterial Endocarditis.-Closely linked to the two subjects just presented was a dread disease hitherto almost invariably fatal (that is, prior to the decade 1937-46) but now happily curable in the majority of cases—direct infection of the heart's lining by the streptococcus viridans. It was, of course, in the therapy of this disease that the greatest advance had come, but there were three other aspects demanding consideration too. It had become more and more evident that the responsible streptococcus is an occasional invader of the blood stream even in apparently healthy individuals who present no favourable ground for the settling down and growth of the organism in the body and that a common, probably by far the most common, source of origin of the blood stream invasion is via dental infection and extraction (in at least 50% of cases). Second, every person with rheumatic valvular disease or congenital cardiovascular defects (with the probable exception of auricular septal defects) should watch for and report at once any unexplained malaise or fever which has often in the past been allowed to continue for weeks before a correct diagnosis has been made, thus losing an early and doubtless more favourable opportunity for curative treatment. Third, even though chemotherapy may control the infection and give promise of complete recovery from the presenting illness there are three hazards

which may upset the favourable course of the patient and even lead to relatively early death. These are congestive heart failure, peripheral (or pulmonary) embolism and acute rheumatic myocarditis. These complications are not at all rare.

Prior to 1939, when sulfonamide therapy became available, the mortality from subacute bacterial endocarditis exceeded 99%. With the sulphur compounds, about 6% of the cases recovered during the next few years. But it was only with the advent of adequate penicillin dosage of 400,000 or more units in 24 hours over a period of several weeks that striking relief came early in 1944. When sufficient penicillin was administered, three-quarters of the patients recovered, a dramatic change from the less than 1% prior to 1939. In rare cases it may be necessary to give several million units daily; however, some kinds of penicillin, e.g., X, have a higher specific effect on the streptococcus viridans than do others and hence require smaller doses for curative action.

Other Infectious Types.—Cardiovascular syphilis fortunately continued to decline in incidence and severity in communities where preventive measures, early diagnosis and adequate treatment were well established. Diphtheria again cropped up here and there during World War II to damage the heart in a few patients, especially in the case of those with unrecognized skin diphtheria. Two interesting and common virus diseases, previously exonerated as causes of heart disease—mumps and influenza—were shown capable of seriously affecting the heart muscle in rare cases. This raised the possibility of milder undiagnosable involvement in other cases.

Endocrine Factors.—These factors, in relation to the heart, became clearer. A high metabolic rate, as in thyrotoxicosis, was associated with little coronary atherosclerosis, though the burden of excessive rates, now happily controlled by adequate and early treatment, can impose severe strain on the heart. It is even thought advisable to try thyroid extract itself in aftempts to reduce the progress of coronary heart disease in young persons who show unusually low basal metabolic rates and high blood cholesterol content. The small heart in Addison's adrenal disease was found to dilate and increase rapidly in size, with the development even of congestive heart failure, when specific therapy by desoxycorticosterone acetate is pushed too rapidly; in fact, quantitative measurement of heart size by X-ray remained one of the best guides in following treatment of Addison's disease. The relationship of sex to any disease rarely had been more strikingly manifested than in the remarkable preponderance of the male sex in coronary heart disease under the age of 40 (24 to 1, or 96 to 4 in a series of 100 cases reported in 1937 by R. E. Glendy, S. A. Levine and P. D. White); this relationship demanded detailed study with respect to factors of the degree of masculinity and of metabolic function.

Hypertensive Heart Disease.—During the decade, this disease ceased being a hopeless and uninteresting condition even though the fundamental cause of hypertension itself in the great majority of cases remained obscure. The advent of measures to reduce the blood pressure very appreciably in a good many cases of serious hypertension, malignant and otherwise, even though arduous and cumbersome, resulted in relieving the cardiac load sufficiently to get rid of heart failure and to improve very much the electrocardiograms and X-ray pictures of such cases, thus demonstrating further the reversibility of heart disease which, in this particular kind of heart trouble, had rarely

occurred with former therapy. The therapy that had produced this favourable effect was especially the improved lumbodorsal sympathectomy introduced by R. H. Smithwick. The majority of cases showed much improvement so far as heart strain was concerned, despite disadvantages which had to be balanced against the gains secured.

Further studies of hypertension during the decade revealed the importance of transient or paroxysmal blood pressure elevation as a threat to the heart and arteries, and the great need in this connection of an adequate method of determining the percentage of each 24 hours in which appreciable hypertension occurs. Often the blood pressure in a given patient is found elevated in the doctor's office, for example, and yet normal when the patient is at rest at home. How much elevation of pressure, and for how long, was to be regarded as a hazard demanding the current effective radical therapy and remained unknown.

Coronary Heart Disease.—Comments have already been made above concerning the possible or probable relationship of cholesterol metabolism and sex to the early development of an important and crippling degree of coronary artery atherosclerosis. Another aetiological factor demanding investigation was autonomic nerve imbalance based on experimental studies of G. E. Hall, who conclusively showed that parasympathetic (vagal) stimulation carried out for a long enough time produces serious, indeed fatal, coronary heart disease as well as other lesions in the dog, conditions not normally found but which can be prevented by the inhibiting effect of atropine.

Doubtless the most important development in the knowledge of coronary heart disease, however, was the proof by simple careful clinical follow-up studies of the fact that much of the disability from angina pectoris and acute coronary thrombosis is temporary, lasting weeks, months or a few years in the former and much less in the latter, and clearing completely or in large measure upon the slow establishment of an adequate collateral coronary circulation and upon the healing of the myocardial scar. Thus there are all grades of trouble, but even with severe angina pectoris decubitus or quite large myocardial infarcts the illness may be acute or subacute with good recovery and survival for a good many years of a useful and happy life. This truth was in striking contrast to the old traditional fatalistic view of angina pectoris. This very change in prognostic outlook in coronary heart disease naturally raised much doubt about a variety of methods of treatment tending to be inadequately controlled, including drugs by mouth (except for the nitrites), injection of testosterone, radiotherapy and operative procedures such as sympathectomy (except as a symptomatic measure), total thyroidectomy and direct plastic operations on the heart itself to aid in the development of collateral vessels. This experience did not mean that such efforts should cease but rather that investigators should be very critical and should not regard past attempts as more than the beginning of work along these lines.

Pulmonary Embolism and the Acute Cor Pulmonale.—One of the most important and interesting advances in knowledge of cardiovascular disease during the decade concerned obstruction and hypertension in the pulmonary circulation and their direct effect on the heart. By far the commonest cause for such is pulmonary embolism, long well-recognized as a postoperative or postpartum complication but only much later appreciated to be even more common in medical patients, especially in those with heart disease and heart failure where both lung signs and symptoms and leg vein thrombosis are so easily masked by the results of the heart disease itself. The greatly preponder-

ant site of the thrombosis that originates the embolism is in the leg veins (especially in the calves) and not in the right heart chambers as once thought; this leg vein thrombosis may produce no symptoms or signs and be discovered only at autopsy or operation. The episodes of pulmonary embolism, often recurrent, are frequently misunderstood and labelled "pneumonia" or "heart attacks," but any acute illness, especially in a cardiac patient, consisting of an abrupt feeling of something wrong in the chest with sharp elevation of pulse and usually also of respiration and temperature should be viewed with suspicion and studied carefully even though there may be no early signs in the chest, blood spitting or X-ray evidence. In a few (about 10%) of the cases the embolism may be massive enough to cause acute dilatation of the right heart chambers, labelled the acute cor pulmonale, with a distinctive electrocardiographic pattern, which on occasion is a vital clue.

Since pulmonary embolism with or without infarction is the most common complication of congestive heart failure which leads to death and since the prevention thereof, or of recurrent attacks, may prolong life and improve health, it became of the greatest importance to make an early diagnosis and to institute treatment. Bilateral common femoral vein ligation remained the procedure of choice and was well borne by the patients requiring it. Ligation of the superficial femoral veins does not guard against thrombi discharged from the profunda femoris veins, and unilateral ligation is generally inadequate since in the majority of cases both legs are involved and the most dangerous clots may come from the leg that seems the more normal. Anticoagulant drugs, heparin and dicoumarol, had also been used, especially in postoperative cases, to reduce the frequency of pulmonary embolism and to lower the mortality thereby, but they had the disadvantage of lack of finality, and their use needed to be carefully controlled by frequent checking of the blood prothrombin time.

Heart Failure.-Finally, an important addition to the treatment of heart failure was made to the measures already in use. Rest, digitalis and diuretics had become standard procedures widely known and as a rule well administered, but although it had been recognized for a long time that water balance in the body is largely dependent on the electrolytes and that sodium accumulation leads to water retention, the practical application of the restriction of sodium intake quantitatively in 24 hours was a late development. It was not enough to advise a patient simply to limit salt in his diet; it was necessary to say how much and to show how it could be done by prescribing a specific diet. The usual intake of sodium chloride in the average normal diet has a wide range of from 5 to 15 grams, and it may be necessary simply to reduce the particular patient's intake a little to get results; on occasion, however, a reduction to an intake of only 11/2 to 21/2 grams of salt daily may be needed to clear oedema. Under such circumstances, water is to be given freely even up to three or four litres a day with good diuretic effect. This change from the old historic custom of severe reduction of fluid intake, to one litre (quart) for example, resulted in much improvement in the therapy of congestive heart failure and of other types of congestion as well, with reduction of the need of the often fatiguing mercurial diuretics and the relief of distressing thirst.

Helium

The production of helium in the United States was 9,500,000 cu.ft. in the fiscal year 1939-40, and 16,173,000 cu.ft. in 1940-41, while output in the second half of 1941 increased to 15,721,000 cu.ft. In 1940-41, the U.S. navy used about 7,000,000 cu.ft., mostly in blimps for coast patrol work, but small amounts were used mixed with oxygen to make an artificial atmosphere for deep-sea diving; the weather bureau used 3,700,000 cu.ft. for the inflation of weather observation balloons, while the army used an unreported amount in the inflation of barrage balloons. Sales for medical, scientific and commercial uses were 1,247,000 cu.ft.

To what extent the war program expanded the helium output was not known at the end of the decade 1937-46.

The original plant at Amarillo, Tex., was increased in capacity, and several additional plants were built at other locations where helium was found to occur. Neither the capacity of these plants nor their output was made public, but an official report stated that postwar demand from private sources, over and above government demands, could be met up to 10,000,000 cu.ft. monthly, at a price of about one cent per cubic foot.

Aside from the applications mentioned above, new war uses were largely in metallurgical lines, especially in the provision of an inert atmosphere for the arc welding of magnesium alloy sheets for aeroplane wings and the welding of defects in magnesium castings. Aside from its use in the building of planes, helium was also used to lighten the dead load of planes, as 13 lb. of helium could replace 92 lb. of air in the inflation of a 110-in. landing tire.

(G. A. Ro.)

Helsinki

In 1812 a Finnish fishing village housing 3,000 people in wooden huts, Helsinki (Swedish Helsingfors) had become by 1937 a capital city with a population of 293,000 (pop. 1939, 304,965). The squares of white stone houses in the classical style of the 19th century and great public buildings of the early years of Finland's independence—especially Siren's parliament house and Saarinen's magnificent railway station—made Helsinki a worthy capital. In

Gutted street in a suburb of Helsinki, Finland, after a bombing raid by soviet planes in 1944

the years after 1937, the population increased rapidly, reaching 347,000 by the end of 1945, and some important new buildings were erected, including vast residential blocks in the Töölö quarter.

In the Russian "winter war" (1939-40) and the renewed Russian war (1941-44) the Russian bombing was unconcentrated and inaccurate—almost the first building to be destroyed by Russian bombs was the Russian legation—and in comparison with other raided capitals Helsinki suffered little; only 259 houses were hit and 1,830 rooms destroyed.

By 1946 the city had almost its prewar aspect. Helsinki was clean and light again, most of the war damage had been repaired, the university and the theatres were flourishing and factories and offices were hard at work. But because of the armistice terms the people were ill-clad and underfed, flats were overcrowded (a maximum of one room per person was strictly enforced), the direct railway line to Finland's second city, Turku (Abo), was cut and there were no longer any air lines between Finland and the western world. (J. H. JN.)

Hemp

Most of the world's hemp crop was grown in the U.S.S.R., Italy and Yugoslavia prior to World War II. United States imports were about 955 tons in 1937, principally from Italy and Yugoslavia. Germany and Italy were trying to develop a method of spinning the fibre as a substitute for cotton, and had made considerable progress before 1939.

Prior to 1940, only Wisconsin and Kentucky produced U.S. hemp in any quantity. The control of the crop was taken over by War Hemp Industries, Inc. in 1943, and the acreage was increased 60%, grown under contract.

							Ρ,	odi	uction of Hemp in		,	19:	37	-4	6			
										011457								
937		٠	٠		٠			٠	1,040,000	1942								- 13,922,000
938	٠	٠							1,246,000	1943								140,680,000
939	•	•	•		•				1,282,000	1944								67,490,000
940	٠	٠	•	٠	•	•			1,665,000	1945								. 51,632,000
941									7,410,000	1946				-		Ť	Ť	4 508 000

The crop of 1943 amounted to ten times that of 1942 and would have been larger had not unfavourable weather caused heavy losses. As the shipping situation improved in 1944, acreage was reduced more than two-thirds and production dropped off to 67,490,000 lb. Further reduction occurred in 1945 with the end of the war emergency need. During the war, 42 plants were built to process the crop; most of them were closed in 1945. U.S. production could not compete with the low cost in other countries. By 1945, the total crop was reduced to 7,300 acres in Wisconsin for fibre and 1,200 acres in Kentucky for seed, compared with 72,600 acres in 1944 in five states. The crop of 1946 was further restricted. (I. C. Ms.)

Henderson, Leon

Henderson (1895—), U.S. economist, was born in Millville, N.J., on May 26, 1895. In 1917 he entered the U.S. army as a private, attaining the rank of captain of ordnance by 1919. In 1920 he returned to Swarthmore college, Swarthmore, Pa., where he received his B.A. degree. During the early New Deal era, he served as consulting economist to the Works Progress (later Work Projects) administration. One of the most important of the New Deal economists, he was largely responsible in 1938 for the Temporary National Economic committee's investigation of business and economic conditions and disclosure of monopoly activities. In 1939 he was appointed

to the Securities and Exchange commission. In April 1041 Pres. Roosevelt created the Office of Price Administration and Civilian Supply (later renamed the Office of Price Administration) and appointed Henderson as its head. Resigning his post with the SEC, Henderson was also appointed to the civilian supply division of the War Production board. Henderson predicted that his efforts to impose rationing and other restrictions on the United States would make him the most unpopular man in the country. In Dec. 1942, as his prophecy seemed to be approaching fulfilment, he resigned from both the WPB and the OPA; the latter resignation was effective on Jan. 20, 1943, when Prentiss M. Brown succeeded him. In May 1943 Henderson joined the Research Institute of America as chairman of the board of editors. He was sent abroad by the U.S. government in Feb. 1945 to examine the problem of the economic control of Germany, and in March held an assignment from the Chinese government to study price problems in China. In April he returned to the Research Institute as chief economist.

Henderson, Sir Nevile Meyrick

Sir Nevile Henderson (1882-1942), British statesman, was born June 10, 1882. A graduate of Eton, he entered the diplomatic service as third secretary at St. Petersburg, Russia, in 1905. He also served in Tokyo and Rome and in 1916 was sent to Paris as first secretary; he was counsellor in Constantinople, 1921, and acting high commissioner there, 1922-24. He was minister to Cairo, 1924, held the same post in Paris, 1928-29, was envoy to Belgrade, 1929-35 and ambassador to Argentina and minister to Paraguay, 1935-37. Sir Nevile was Britain's last ambassador to Berlin, 1937-39, before the outbreak of World War II. He staunchly defended Chamberlain's appeasement policy and in the final weeks before the outbreak of war, shuttled between England and Germany with the hope of averting hostilities. After his return to England, he wrote Failure of a Mission (1940), an apologia of his ambassadorship to Berlin. Sir Nevile died in London, Dec. 29, 1942.

Henlein, Konrad

Henlein (1898-1945), Sudeten-German politician, was educated at a commercial academy and became a bank clerk and later a gymnastics instructor. He was head of the German gymnastics movement (Deutsche Turnbewegung) in Czechoslovakia from 1923 to 1933, when he appeared as leader of the Sudeten-German home front, a party which demanded autonomy for Sudeten-German areas and which became the second strongest party in the Czechoslovakian chamber in 1935. When the party revolted against Czechoslovakia in Sept. 1938, Henlein demanded the cession of the disputed territory to Germany and the revocation of martial law. When his party was suspended for treasonable activities, Henlein fled to Germany to escape arrest. His Sudeten-German "Free Corps," which he then organized, engaged in skirmishes along the frontier until the Czechoslovakian crisis approached its climax. On Oct. 1, 1938, after the four-power conference at Munich had ceded the Sudeten-German areas to Germany, Henlein was appointed by the German government as commissioner for that territory and later became the regional party leader of Sudetenland. Seized by U.S. troops in May 1945, Henlein committed suicide.

Henriot, Philippe

Henriot (1889–1944), French politician, was born at Reims on Jan. 7, 1889. He was a school teacher by profession until his election to the French Chamber of Depu-

ties as member from Bordeaux in 1932; he was re-elected in 1936. Denouncing the liberal and leftist elements in the chamber, he gradually attached himself to the growing French fascist cliques. Although Henriot was outspoken in his attacks against the nazi government, he quickly revised his political slant after the German invasion in 1940 and became an archcollaborationist in the Vichy camp. In 1943 the Pétain regime made him supervisor of Vichy propaganda broadcasts; previous to this appointment, Henriot was editor of the notorious pro-German weekly, Gringoire. In Jan. 1944, Pierre Laval named Henriot minister of information and propaganda; the latter then made two radio broadcasts daily, in which he vented his passionate hatred of the British and urged Frenchmen to collaborate with the Germans. On June 28, 1944, a band of French patriots disguised as Vichy militiamen won entrance to Henriot's living quarters in the ministry of information, broke into his bedroom and shot him to death.

Hepburn, Mitchell Frederick

Hepburn (1896—), Canadian politician, was born at St. Thomas, Ontario, Aug. 12, 1896. He was educated at St. Thomas Collegiate institute and spent three years on the staff of the Canadian Bank of Commerce. In 1918 he served overseas with the royal air force. He was elected to the house of commons in 1926 and was re-elected in 1930. In the same year he was chosen leader of the Ontario Provincial Liberal party, and when that party was returned to office at the general election of June 19, 1934, he became premier of the province.

Although Hepburn had been elected on the basis of a vigorous campaign against the power companies, and was largely responsible for the passage of a minimum wage law, he gradually abandoned his liberal policies in 1937–38 when the C.I.O. started its drive into Canada. Declaiming against unions and the "communist menace," he disowned the title of Liberal and broke with Prime Minister Mackenzie King. He resigned as premier of Ontario in Oct. 1942, and as provincial treasurer in March 1943. Elected to the Ontario provincial assembly in Aug. 1943, he was defeated in the elections of June 1945 and shortly thereafter announced his retirement from politics.

Heredity

See GENETICS; PSYCHOLOGY.

Herriot, Edouard

Herriot (1872—), French politician, was born July 5, 1872, at Troyes in Champagne, France. He graduated from the Ecole Normale Supérieure in 1894 and later taught at the Lycées of Nantes and Lyons. He entered politics in 1904 as deputy mayor of Lyons and became mayor the following year. Thereafter he was mayor of the city almost without interruption, being re-elected at each successive electoral contest. In 1912 he was senator from the Rhône and in 1919 deputy from the department. As leader of the Radical party he was premier in 1924–25 and for a brief period in 1926.

The elections of May 1932, marked by a swing to the left, brought Herriot back into power as premier and foreign minister for the third time. His government was overthrown in Dec. 1932, when the chamber rejected his proposal that France continue to pay its war debt instalment to the U.S. He was vice-premier in the Doumergue cabinet (1934) and in the Flandin cabinet (1936), and in June 1936 he was named president of the chamber of

deputies, a post to which he had been elected previously in 1925.

Herriot remained in France after the German occupation in June 1940, showing at first little opposition to the Vichy rule. In Aug. 1942, however, when Marshal Pétain dissolved the permanent bureaus of the senate and the chamber of deputies, Herriot and Jules Jeanneney wrote a vigorous joint protest to the senate. For this he was arrested in 1942 and later deported to Germany. In April 1945, he was liberated from a German prison camp by Russian troops and returned to his native Lyons, where he had been re-elected mayor. President of the Radical Socialist party, Herriot was returned to the constituent assembly during the national elections of Oct. 21, 1945 and June 2, 1946.

Among his best-known publications are Philon le Juif (1897, crowned by the Académie Française), Madame Récamier et ses Amis (1905), Agir (1917), Créer (1919) and Sanctuaires (1938).

Hershey, Lewis B.

Hershey (1893-), U.S. army officer, was born on a farm near Angola, Ind. He was graduated from Tri-State college at Angola, Ind., and taught in public schools there. Entering the Indiana national guard in 1911, he went to the Mexican border with his unit in 1916, and to France with the 197th field artillery in 1918 as a captain. On his return to the U.S. after the war, he was stationed at Fort Sill, Okla., and later at Ohio State university, where he was assistant professor of military science and tactics for four years. He was at the command and general staff school at Ft. Leavenworth, Kan., for two years, then at the Army War college in Washington and for two years in Hawaii. Returning to the U.S. in 1937, Hershey was appointed to the Joint Army and Navy Selective Service committee as executive secretary. He was largely responsible for laying the foundation of the selective service system as authorized by the National Defense act of 1920, and for setting up the operating machinery for its organization when it was authorized by the Selective Training and Service act of 1940. In recognition of this work, he was raised to the rank of brigadier general in Nov. 1940 and was appointed director of selective service by Pres. Roosevelt on July 31, 1941. Promoted to the rank of major general in April 1942, Hershey remained with the selective service administration during the entire period of World War II, assuming major responsibility for the allocation of manpower to the armed services.

Hershey continued in this position after the end of the war and coped with the problems of a peacetime army and draft.

Hertzog, James Barry Munnik

Hertzog (1866–1942), South African barrister and statesman, was born of Dutch stock at Wellington, Cape Colony, on April 3, 1866. He became a judge in the Orange Free State in 1895, and served throughout the South African war of 1899–1902, retaining thereafter his anti-British sentiments. He was minister of justice in the first union cabinet (1910–12), and in 1913 formed an oppositionist party with independence from Britain as its chief plank. Hertzog became prime minister in 1924, minister of external affairs in 1929 and leader in 1934 of the United South African National party. Gen. Hertzog, as representative of the Union of South Africa, attended the coronation ceremonies in London in May 1937, and the

subsequent imperial conference; on his return he stated that the imperial government had failed to keep its promise regarding the handing over of the native territories to the union, but it was later agreed that there had been a misunderstanding on this point.

Hertzog was strongly opposed to South Africa's declaration of war against Germany and resigned as prime minister on Sept. 6, 1939. He also resigned from the United Nationalist party in Nov. 1940 and, a month later, from parliament. In Oct. 1941, he urged at a convention of the Afrikander party that South Africans adopt a national-socialist form of government. He died at Pretoria, Nov. 21, 1942.

Hess, Rudolf Walther

), German politician, christened Rich-Hess (1894ard Rudolf, was born April 26, 1894, at Alexandria, Egypt, the son of a German importer. He studied in Switzerland and Godesberg, Germany. During World War I, he enlisted in the German army, saw heavy fighting at Verdun, and met Adolf Hitler on a French battlefield. After the war, Hess became Hitler's personal aide in the fledgling nazi party; they were side by side in the abortive Munich beer hall putsch of 1923 and were imprisoned together. His loyalty was firm during the critical years of the party's rise to power. Hess controlled the party machine after Dec. 1932, reorganizing and "cleansing" the party and serving as Hitler's personal representative in party affairs and as a member of the secret cabinet. In Hitler's will Hess was named second choice (after Goering) as successor.

On May 10, 1941, Hess flew to Scotland, made a parachute landing near Glasgow, and was then held incommunicado by the British authorities. It was later discovered that he had undertaken this astonishing trip in the self-imposed role of peacemaker. He was nevertheless indicted as a major war criminal by the United Nations War Crimes commission in Aug. 1945, after the end of World War II. He was sentenced to life imprisonment by the Nuemberg tribunal on Oct. 1, 1946.

Hewitt, Henry Kent

Hewitt (1887—), U.S. naval officer, was born Feb. 11, 1887, in Hackensack, N.J. Graduating from the U.S. Naval academy in 1906, he was commissioned ensign in 1908. He was decorated with the navy cross in World War I. After that war he served as commander of a destroyer division, fleet gunnery officer and trainer, instructor at the Naval academy, and inspector of ordnance at Puget sound.

When President Franklin D. Roosevelt took a cruise to South America on the "Indianapolis" in 1936, Hewitt acted as commanding officer. He was promoted to the rank of rear admiral in Dec. 1940.

Admiral Hewitt was named to command the U.S. naval units in the huge Allied fleet that protected the U.S. landings in North Africa on Nov. 8, 1942. He led the naval engagement that helped force the surrender of Casablanca, and in recognition of his services was made vice-admiral in Nov. 1942. His 8th fleet also played a part in the Sicilian campaign in 1943 and in the attack on the Italian mainland, particularly the landings at Salerno. In Aug. 1944, he was placed in command of all Allied naval forces in the invasion of southern France. Promoted to the rank of admiral in March 1945, he was assigned two months later to conduct further investigations into the Pearl Harbor attack. On July 14, 1945, he was appointed commander of U.S. naval forces in Europe.

Heydrich (1904-1942), German gestapo official, was born March 7, 1904, in Halle, Prussian Saxony. At the age of 14 he joined a Free Corps band, where he became schooled in street-fighting, terrorism and looting. In 1922, he joined the navy, rising to the rank of lieutenant, but resigned in 1931 to devote his time to nazi party affairs. Soon after Hitler became chancellor, Heydrich was appointed chief of the political department of the Munich police force, with control over the notorious Dachau concentration camp. In 1934, he was appointed gestapo chief for Berlin and was later made deputy chief of the gestapo under Heinrich Himmler. Ruthless in dealing with "enemies of the state," Heydrich in Sept. 1941 was appointed to supersede Baron Constantin von Neurath as reichsprotector for Bohemia and Moravia. He ordered the execution of 300 Czechs within five weeks after his arrival in Prague. He was also dispatched to Norway, the Netherlands and occupied France to suppress mounting sabotage and terrorism, and his visits resulted in more mass executions which earned him the nickname of "the Hangman." On May 27, 1942, Czech patriots shot him while he was riding in his car on the Prague-Berlin highway. He died the following June 4 in a Prague hospital. Gestapo officials exacted vengeance for his death by executing hundreds of Czechs and wiping out the entire village of Lidice, whose townsfolk were accused of harbouring Heydrich's assassins.

Higashi-Kuni, Naruhiko

Prince Higashi-Kuni (1887—), Japanese statesman, was born Dec. 3, 1887, ninth son of Prince Asahiko-Kuni and second cousin of the emperor. His wife was the ninth daughter of Emperor Meiji, and the prince established in 1906, by order of Meiji, the separate imperial house of Higashi-Kuni. After Higashi-Kuni's return from France, where he was a student from 1920 to 1927, he was given command of an infantry regiment. In 1935 he was named high military councillor and was reappointed to this post in 1937 with the rank of general.

On April 16, 1945, Higashi-Kuni was named supreme war councillor. After Emperor Hirohito made his surrender broadcast on Aug. 15, 1945, the Suzuki cabinet resigned "in disgrace," and Higashi-Kuni formed a new cabinet. He assumed concurrently the posts of premier and war minister, and adjusted his policies to the exigencies of defeat and of foreign occupation. On Oct. 5, 1945, Higashi-Kuni resigned. The following month he announced that he had requested the emperor's permission to become a commoner again.

Highways

See ROADS AND HIGHWAYS.

Hillman, Sidney

Hillman (1887–1946), U.S. labour leader, was born at Zagare, Russia, on March 23, 1887. In 1907 he emigrated to the U.S., where he worked first as a clerk, then as a garment cutter. He helped organize the Amalgamated Clothing Workers of America and served as its president almost continuously from 1915 until his death in 1946. He was active politically during all of President F. D. Roosevelt's administrations—as a member of the labour advisory board of the National Recovery administration, on the National Industrial Recovery board, and on the Fair Labor Standards board. Appointed an associate director of the Office of Production Management in Jan.

1941, he played an important part in preventing and settling defense strikes. He was also named to represent labour on the Supply Priorities and Allocations board. In July 1942 Hillman resigned as special assistant to the president on labour matters to return to his old job as president of the C.I.O. Amalgamated Clothing Workers.

As treasurer of Labor's Non-Partisan league in 1936, Hillman campaigned vigorously for the re-election of President Roosevelt. In 1944, as organizer and chairman of the Political Action committee of the C.I.O., he was again instrumental in rallying the labour vote behind Roosevelt. It was charged, at this time, that President Roosevelt told his advisers to "clear everything with Sidney." The principle of conscious participation of labour in political activity was furthered with the formation of the National Citizens Political Action committee, with Hillman as chairman; the committee threw its weight behind special appointments such as that of Henry A. Wallace as secretary of commerce, and endorsed candidates on the congressional and local levels. In Oct. 1945 Hillman was elected one of the vice-presidents of the newly formed World Federation of Trade Unions. Hillman died July 10, 1946.

Himmler, Heinrich

Himmler (1900-1945), German police official, was born Nov. 7, 1900, at Munich. He studied agriculture at the University of Munich and later became a member of the Academy of German Law. In 1927 he became deputy leader of the Schutzstaffel (known as the S.S., Black Shirt or Elite Guard troops) and he was appointed leader in 1929. Himmler was reich director of propaganda, 1926-30, a member of the reichstag and Prussian state council, 1933, commander of the united German police forces, 1936, and deputy head of the reich administration, 1939. He was empowered by Adolf Hitler to suppress antinazi resistance at home and in the occupied countries, and his methods were brutal and ruthless. The fuehrer made Himmler interior minister on Aug. 24, 1943 and by Nov. 1944 it appeared that the gestapo chieftain had assumed executive control over Germany, replacing Goering as the No. 2 nazi. After the Doenitz government was formed on May 1, 1945, following Hitler's death, Himmler went into hiding. He adopted a disguise which might have proved effective, but his identity papers, made out in the name of Hitzinger, aroused suspicion of British soldiers at Bremervoerde and Himmler was arrested on May 21. He revealed his identity and was placed under strict custody. The gestapo chief was able, however, to swallow a vial of poison carried under his tongue, and died a few minutes later on May 23, 1945.

Hiranuma, Kiichiro

Hiranuma (1867—), Japanese statesman, was born Sept. 28, 1867, at Okayamaken, the son of a samurai. He was educated at the law college of Tokyo Imperial university, where he graduated in 1888. In 1906 he became director of the bureau of civil and criminal affairs. Appointed minister of justice in 1923, he was created a peer the following year and a baron in 1926. On Jan. 4, 1939, he was named premier to succeed Fumimaro Konoye. His foreign policy, like that of his predecessor, was based on strict adherence to the anti-Comintern pact and friendship for Germany. He resigned in Aug. 1939 and was made minister of home affairs in the Konoye cabinet in Dec. 1940. Hiranuma was shot and badly wounded by

an assassin in Aug. 1941. In Sept. 1942 he was sent on a mission to the Japanese-sponsored Chinese regime at Nanking where he negotiated a secret treaty with Wang Ching-wei, head of the Nanking puppet government, providing for the autonomy of North China and Inner Mongolia. After the defeat of Japan by the Allies, Hiranuma was arrested as a war criminal.

Hirohito

Emperor Hirohito of Japan (1901—), was born April 29, 1901, the son of Emperor Yoshihito. After attending the peers school, he was commissioned a sublicutenant in both the army and navy at the age of 10. Abandoning his sheltered life in 1921, he toured Europe, thus becoming the first Japanese crown prince to visit the western world. In 1924 he married Princess Nagako

Emperor Hirohito of Japan photographed in the fall of 1945

Kuni. Hirohito became prince regent in 1921 and ascended the throne in 1926, although he was not formally enthroned until Nov. 10, 1928. The era of his reign was called "Showa" or Light and Peace.

The role of Hirohito in the Japanese aggressions has been much disputed. Although his apologists asserted that he was "outside" and "above" politics, he approved the various Japanese acts of aggression from the seizure of Manchuria in 1931 to the attack on Pearl Harbor a decade later. He personally proclaimed the nation at war with the United States and the British empire after the

attack on Pearl Harbor. During most of the war Hirohito remained in semiseclusion, although he had, late in 1941, nominally assumed control of the army. When it became apparent that Japan was losing the war, the position of the emperor became crucial; the government agreed to sue for peace provided the emperor retained his prerogatives. President Harry S. Truman accepted, with the condition that Hirohito be subject to the authority of the supreme Allied commander. After the armistice of Aug. 15, 1945, Hirohito's rule was subordinate to that of General Douglas MacArthur, but he was not included on the list of high-ranking Japanese statesmen indicted as war criminals. Hirohito repudiated war as an instrument of national policy and pledged the introduction of social and constitutional reforms. MacArthur's decree abolishing Shinto as the national religion was followed by a rescript of the emperor on Jan. 1, 1946, in which he disclaimed his divinity. Making public appearances among his people and increasingly subject to the will of the national diet, the divine and absolute character of Hirohito's authority was further modified during 1946.

Hiroshima

During World War II, Hiroshima was the principal administrative and commercial centre of southwestern Honshu, Japan, and the foremost Japanese military shipping point for men and supplies as well as an important military command station and supply depot.

On Aug 6, 1945, Hiroshima was the target of the first atomic bomb attack. The bomb was dropped at 8:15 A.M. from the B-29 "Enola Gay," which, with two observation planes, comprised the striking force. The bombing plane, piloted by Col. Paul W. Tibbets, Jr., commanding officer of the 509th composite group of the 20th air force, was one of many such B-29's based in the Marianas Islands 1,500 mi. away. The 509th group had been specially equipped and trained for delivery of the atomic bomb; the skill of the crew and the good weather encountered made the mission uneventful. There was no opposition except for 20 inaccurate bursts of flak on the return flight. The bomb run was short and straight. The crews of the two escort planes, observing the explosion through protective goggles, reported that the flash after the explosion was deep purple, then reddish. The cloud, shaped like a mushroom, was up to 20,000 ft. in one min., at which time the top part broke from the stem and eventually reached 30,ooo ft. The base of the column of smoke, looking now like a giant grave marker, stood one minute after the explosion upon the whole area of the city, excepting the southern dock area. This column was a thick, white smoke, darker at the base, and interspersed with deep red. At the time of the explosion, the three aircraft were about 15 mi. from the target. Even so, their crews reported feeling two shock waves jar their planes. At a distance of 390 mi., crew members could still see the column of smoke rising into the morning sky.

Of Hiroshima's population of 245,000, reduced by systematic evacuations from a wartime peak of 380,000, about 66,000 were killed and 69,000 were injured. The chief causes of casualties were burns, from the radiant heat from the bomb or from blazing buildings, and mechanical injuries from flying debris and falling buildings. The evidence indicated that burns were the cause of the greatest number of casualties, although the number resulting from mechanical injuries may have been as great. Some injuries

may have been caused by direct blast pressure. Gamma rays and other radiation emitted at the time of the nuclear fission explosion caused "radiation sickness"; about 15% of the total casualties within the two months immediately following the explosion resulted from this cause. Vegetation was affected, but recovered and continued to grow in the area.

Hiroshima was built on the flat delta of the Ota river where it flows into the Inland sea. Though the city limits embraced 26 sq.mi., the main built-up sections were compressed into seven sq.mi. at the heart. The bomb exploded over the centre of the city, and no natural obstacles opposed the uniform spread of its blast and heat. Many fires were started, some by the "flash" heat but most of them ignited during the collapse of buildings. These separate blazes extended eight miles out, where some window glass was shattered. "Japanese-type" dwellings were destroyed or made unusable within an area of six sq.mi., and steel frame buildings within an area of 3.4 sq.mi. Reinforced concrete buildings of earthquake-resistant construction often survived as shells, though gutted by fire and stripped of windows and partitions. Of the 90,000 buildings in the city, 62,000 were destroyed and 6,000 more rendered unusable.

The several thousand small workshops interspersed through the city were wiped out. All utilities and transportation services were disrupted for varying lengths of time. Fire-fighting and rescue services were overwhelmed; only 16 pieces of fire-fighting equipment remained usable. Medical personnel and facilities were 90% casualties. Panic-stricken flight temporarily emptied the city of survivors, seriously hampering relief work. By Nov. 1, 1945, however, 137,000 of the inhabitants had returned; a year later the city was being slowly rebuilt. (C. E. Ly.)

Hirota, Koki

Hirota (1878-), Japanese diplomat, was born in Fukuoka, Kyushu. He entered the foreign service in 1905, serving in Peking, China, London, England and Washington, D.C., before acting as minister to the Netherlands in 1926 and ambassador to the soviet union from 1930 to 1932. He was foreign minister from 1933 to 1936, prime minister from March 1936 to Jan. 1937, and foreign minister once again from June 1937 to May 1938. Maintaining close relations with Mitsuru Toyama, head of the extreme nationalist Black Dragon society, he safeguarded himself against criticism from nationalist circles, while at the same time his statements on foreign policy were generally couched in conciliatory language, and he remained on excellent personal terms with the foreign diplomats in Tokyo. He was called on to head the cabinet formed after the spectacular military revolt of Feb. 26, 1936; his cabinet fell one year later after members of the diet had sharply criticized the army. He then served as foreign minister in the cabinet of Prince Fumimaro Konoye until May 1938. During World War II Hirota continued to be associated with the Black Dragon society, and after the defeat of Japan he was arrested as a war criminal by U.S. troops.

Hitler, Adolf

Adolf Hitler (1889-1945?) fanatic genius and scourge of the 20th century, was born at Braunau-am-Inn, Austria, April 20, 1889. His father, Alois (Schicklgruber) Hitler, was a customs official of the Austrian empire in the border village of Braunau. His mother, Klara Poelzl, second cousin and third wife of Alois, was 23 years younger than the latter; she had been a maid of Alois' second wife. The father died when Adolf was 13 (1903) and the mother when he was 19 (1908). The boy went from an unhappy home to become an artist in Vienna-and that was also an unhappy experience. He began to blame his personal failures on society, and especially on the Jews. Shortly before World War I began, he wandered to Munich and entered the German army in 1914. He was doubtless a good soldier, and won the Iron cross, but the fervour of his love for the German fatherland did not win him promotion beyond the rank of lance corporal. In a hospital at the moment of the Armistice, he felt all the more keenly his personal inability to save Germany from its fate.

In the years of chaos and futility after 1918 he got into petty espionage work, and from that into the little group which became the nucleus of the N.S.D.A.P.—the nazi party. The power of his voice, the magnetism of his personality when aroused by a crowd, won him followers by the dozen, the hundred, and finally the million. He was not merely a demagogue ranting denunciations for the sake of personal power; no, as many learned to their

Caricature of Hitler widely distributed by the French underground during the German occupation. The caption reads: "There can be no mistake; that's a pretty beast." The word "vache" has two meanings: "cow" and "beast"

"You Did All That!" Cartoon by Burck which appeared in the Chicago Times on May 3, 1945

amazement, the man actually believed the fanaticism which he preached—and that was what made him dangerous to Germany and to the world. His personal frustration accentuated in him the tragedy of Germany's frustration, and made him and the German people feel more deeply that he represented and personified them all.

After the failure of his first attempt at a military coup in 1923 he was jailed. Thus he had the opportunity to write that most vicious and most significant book of the early 20th century—Mein Kampf. In it he expounded his philosophy and his purpose (Mein Kampf, translated by Ralph Manheim, Houghton Mifflin, 1943):

Therefore, I saw my own task especially in extracting those nuclear ideas from the extensive and unshaped substance of a general world view and remolding them into more or less dogmatic forms which in their clear delimitation are adapted for holding solidly together those men who swear allegiance to them.

He felt the "magic force of the spoken word alone," and held that propaganda must adapt itself to the lowest intellectual level of the listeners. He justified his own fanaticism:

Only a storm of hot passion can turn the destinies of peoples, and he alone can arouse passion who bears it within himself. It alone gives its chosen one the words which like hammer blows can open the gates to the heart of a people.

And so, with passion, and appealing to the emotions, he denounced Jews ("... by defending myself against the Jew, I am fighting for the work of the Lord"), he condemned the treaty of Versailles, he poured contempt on democracy and parliaments, he raised hate and intolerance to a pinnacle ("... the most cruel weapons were humane if they brought about a quicker victory." He called for a

national rejuvenation; he pleaded for the individual to sacrifice himself for the sake of the community; he urged that only through the leadership of one man—and he that man—could the people realize themselves; he apotheosized the state and the Germanic "race." His leadership of the nazi crusade brought him bitter denunciation, but it brought also utter adoration, and by Jan. 1933 the combination of appeal to the masses, intrigue with big business and the brute force of the brown shirts, lifted Hitler to the position of chancellor of the German reich. He quickly consolidated his position; he and the nazi party became the dictators of Germany, and the new militarized state began speaking with force in European affairs.

Mussolini was at first his model and his guide, but Hitler soon outshone his master, and was backed by much greater power. His ambitions grew with his success, and each new step became a means by which previous promises could be abandoned. Again and again it was Hitler's personal will which overrode the advice of his officers and ministers and brought about the remilitarization of the Rhineland (1936), the Anschluss with Austria (1938), and the diplomatic coup of Munich (1938). To many Germans he was on a level with God; he was the "Prince of Peace" who knew how to get things for Germany without war. But he knew not the limits of power, and seemingly came to think there were no limits. He permitted, if he did not inspire, the pogroms of Nov. 1938. He forced stricter controls on Czechoslovakia and sent panzer divisions and bombers into Poland. It was he who directed the deal with the U.S.S.R. in 1939, and it was he who decided upon the attack on the U.S.S.R. in June 1941.

By the power of his personality, Hitler held the German people in the hollow of his hand. He used and threw aside the great industrialists and kept behind him a team of divergent and unscrupulous aides like Goering, Goebbels, Hess, von Ribbentrop, et al. He made himself the personification and the fountainhead of German nationalism, of German power.

After the pinnacle of nazi power was reached in 1941, there followed the slow but relentless tightening of the vise. The Germans had conquered vast territory, but they had not conquered the will or the heart of the U.S.S.R., or Norway, or France or the other peoples under thumb. The British stood steadfast, the U.S. girded its strength. By the time the western Allies landed in Normandy in June 1944, Hitler's legions had been repulsed in the U.S.S.R. and in North Africa, and western Europe was seething with discontent. Hitler's personal intervention in military leadership merely made the situation worse. His famous intuition could no longer be trusted. Many of the officials around him saw the handwriting on the wall and felt that if they could remove Der Fuehrer there might be a better chance to salvage Germany. The officers' plot of July 20, 1944, was to blow Hitler to bits with a bomb. But the scheme failed, by narrow margin. There was bloody retribution, as there had been back in 1934 in the great purge. Hitler's leadership was reaffirmed, and this meant that Germany must fight to the bitter end and go down if necessary in cataclysmic destruction; the German fate must be world power or . . .

Götterdämmerung.—In the fall of 1944, the Allied armies converged on Germany from east, south and west. Fanatic leadership could no longer produce enough soldiers or planes or rockets to stem the tide. As the German armies were driven back, the nazi leaders within the besieged country intrigued among themselves. Himmler complained

of Hitler's health and his abnormal way of life, turning night into day and sleeping only two or three hours. By early April 1945, Himmler, Walther Schellenberg (chief of the German intelligence service), Franz Seldte (minister of labour), and Count von Krosigk (minister of finance), were in contact with one another, trying to find a means to put Hitler aside and end the war. Doctors disagreed on Hitler's reported illness with Parkinson's disease, and even Himmler hesitated to take forceful action.

On came the soviets. Hitler was urged to flee to his mountain aerie at Berchtesgaden and direct the struggle from there. But, possibly under the influence of his mistress Eva Braun, he decided to die with her a martyr's death. On April 22 Hitler told a staff conference that the war was lost and that if Berlin fell he would die there. On the same day he had an attack of nervous prostration, and violently blamed everyone for the German tragedy. The British intelligence service worked out, in the next five months, a detailed reconstruction of events, and it appears that Hitler did not leave the reichschancellory after April 22. Periods of calm alternated with spasms of despair and recrimination. With a small group (Josef Goebbels, Martin Bormann, Eva Braun and some of his personal staff) Hitler waited while shells fell around the bunker and the soviets surged toward the heart of Berlin. Perhaps it was then that he wrote what was reported as his political testament-a document dated April 29. The document blamed the war on international Jews, urged Germany to strengthen its resistance and predicted a rebirth of the nazi movement. Himmler and Goering were expelled from office and party for "illegally attempting to seize control of the state." Karl Doenitz was named head of a new cabinet to carry on the war. And here Hitler recorded his choice of suicide rather than capture or surrender.

In the evening of April 29 Hitler married Eva Braun; at the wedding feast the talk was all of suicide. He destroyed his Alsatian dog, and at about 2:30 A.M. of April 30 said goodbye to a score of people in the bunker. Then supposedly the bridal pair retired to death-he by a shot through the mouth, she by poison. Midafternoon of the 30th, some 40 gallons of gasoline were brought; the body of Eva Braun and another body wrapped in a blanket were soaked with gasoline and burned, and the charred bodies were buried there in the garden of the reichschancellory bunker. Presumably the body in the blanket was that of Hitler. Telegrams signed by Goebbels and Bormann, dated May 1, announced that Hitler had died the day before. Escape was well-nigh impossible, and rumour upon rumour of Hitler's appearance in Argentina and elsewhere proved groundless.

Absolute proof might never appear, but the evidence indicated that Adolf Hitler died by suicide a week before the final collapse of the nazi reich which he had built. (See also GERMANY; WORLD WAR II.)

Hlinka, Andreus

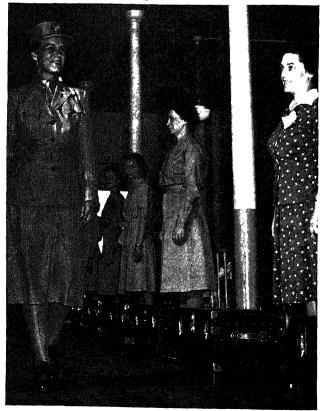

Father Hlinka (1864–1938), Slovak churchman and politician, was ordained a priest of the Roman Catholic church in 1889. He began his political championship of the Slovaks when his countrymen were still subject to

Austro-Hungary; and after the creation of Czechoslovakia he became leader of the Slovak Clerical party in the chamber of deputies, his goal being Slovak autonomy. After some years of collaboration with the Czech Clerical party, Father Hlinka's party went into opposition in 1929. He died in his parish of Rŭzomberok in western Slovakia on Aug. 16, 1938, only a few weeks before the first dismemberment of Czechoslovakia by the Pact of Munich, Sept. 30, 1938.

Hobby, Oveta Culp

Mrs. Hobby (1905-), U.S. director of the Women's Army corps (WAC) during World War II, was born Jan. 19, 1905, in Killeen, Tex. Graduating from the University of Texas law school, she was successively a member of the Texas legislature, assistant city attorney of Houston and a bank director. She also helped codify Texas banking laws and was the author of a text on parliamentary law. In 1931 she married William Pettus Hobby, then governor of Texas, and took an active interest in his newspaper, the Houston Post, becoming executive vicepresident. In 1941 Mrs. Hobby was appointed chief of the women's interests section of the war department's public relations bureau. At the behest of Gen. George C. Marshall, she drafted plans for a women's army, and on May 16, 1942, was sworn in as director of the first force of this kind in United States history, with a rank equivalent to that of a major. Starting with a goal of 12,200 women in uniform, the corps was subsequently authorized to expand to 150,000, and in July 1943 it became an integral part of the army. Awarded the distinguished service medal in Jan. 1945, Mrs. Hobby retired in July of that year with the rank of colonel. She then returned to Houston to resume her position with the Houston Post.

Hodge, John Reed

Hodge (1893-), U.S. army officer, was born June 12, 1893, in Golconda, Ill. He studied at Southern Illinois Teachers college, 1912-13 and then at the University of Illinois. In May 1917 he joined the army and was commissioned a second lieutenant the same year. He went overseas with the A.E.F. to France in 1918 and saw action in the St. Mihiel battle. Hodge, who had joined the war department general staff in 1936, was assigned to the 7th army corps in Dec. 1941. Six months later he was promoted to the temporary rank of brigadier general and fought with the 25th infantry as assistant division commander on Guadalcanal. In April 1943 he was advanced to the temporary rank of major general. Given command of the Americal division, he fought on Bougainville. A year later (April 1944), he assumed command of the 24th corps which landed on Leyte in Oct. 1944. Following the conquest of Leyte, Hodge led the 24th corps in the Okinawa fighting. In June 1945, he was promoted again to the temporary grade of lieutenant general and after the surrender of Japan, he was made commander of the U.S. army of occupation in Korea.

His retention of Japanese officials in administrative positions led to sharp protests from Korean officials. Hodge subsequently explained that he was compelled to use the Japanese until he could replace them with trained Korean personnel. His task was also complicated by Korean resentment over the fact that they were not given immediate independence as well as by sharp political cleavage of the people into rightist and leftist political groups.

Hodges, Courtney H.

Hodges (1887-), U.S. army officer, was born Jan. 5, 1887, at Perry, Ga., and joined the army in 1906 as a private. Commissioned second lieutenant, infantry, in 1909, he served with distinction in World War I, being awarded the distinguished service cross and silver star. After the war he served as instructor at West Point, at the infantry school, Ft. Benning, and the air corps tactical school, Langley Field, Va. He became a brigadier general in 1940 and in 1941 was named chief of infantry of the U.S. army with the rank of major general. When he assumed command of the 3rd army in Feb. 1943, he was promoted to the rank of lieutenant general. After he was succeeded by Gen. George S. Patton as head of the 3rd army, he led an army corps during the invasion of France in 1944, and was then given command of the 1st army. Advancing between the British-Canadian forces and Patton's ard army, the 1st army captured the strategic town of Aachen on Oct. 20, 1944, and projected its advance beyond Aachen in the general offensive launched Nov. 16. After recovering from the German surprise counteroffensive of the following month, Hodges led his forces across the Rhine river in March 1945. On April 17 of that year he was appointed a full general. After the German defeat, Hodges was named head of a special war department board to review the strategic reserve program.

Hodža, Milan

Hodža (1878–1944), Czechoslovak statesman, was born at Sucany in a Slovak district of Austria-Hungary. He studied law in Budapest and Kolozsvar, Hungary, and took his Ph.D. at Vienna university. Born into a Slav minority group of the old Austro-Hungarian empire, where the tradition of separation was deep-rooted, Hodžá devoted his lifetime in politics to attempting a compromise among the clashing nationalities of the Danube basin. He was elected to the Hungarian parliament in 1905, became the first minister to Hungary of the newly created Czechoslovak republic in 1918 and was named premier of Czechoslovakia in 1935 by Pres. Thomas G. Masaryk. During the German-Czech tension preceding the Munich pact, Hodza withstood Hitler's pressure and made it clear that Czechoslovakia would not consent to cession of the Sudeten areas. Forsaken by France and England, however, he was forced to accept the German demands on Sept. 21, 1938. The following day he resigned from office. He later retired to Paris and then to London, where he joined the first Czechoslovak State council as vice-president, 1940-41. Hodža died at Clearwater, Fla., U.S.A., June 27, 1944.

Hoffman, Paul Gray

Hoffman (1891-), U.S. industrialist, was born April 26, 1891, in Chicago. He attended the University of Chicago in 1908-09, and went to Los Angeles in 1911, where he worked as an automobile salesman for the Studebaker corporation. After serving in World War I as a lieutenant in the field artillery, he returned to Los Angeles and founded the Paul G. Hoffman company, an automobile distributing agency. He was Studebaker's vicepresident in charge of sales from 1925-31, when he was named president of the Studebaker Sales Corporation of America. During the depression years the big auto plant went into receivership; it was then reorganized, and in 1935 Hoffman was made president. Under his guidance Studebaker not only was put back on a solid financial basis but was competing successfully with the giant motor corporations in Detroit in producing medium-priced cars.

In addition to his position at Studebaker's, Hoffman was elected to the board of trustees of the University of Chicago in 1937, was named a Federal Reserve bank director in 1942, and became a director of United Air Lines and Encyclopædia Britannica, Inc. in 1943. As one of the leaders in the organizing, in Sept. 1942, of the Committee for Economic Development, and as the chairman of the group, he repeatedly warned against inflation and unemployment, urging that wartime restrictions be removed only gradually.

Hogs

The world's hog industry changed relatively little during 1937–46, the increases in North America almost offsetting losses elsewhere. In Europe, the 1931–35 average number was about 80,000,000 head and by 1944 this number was estimated to have declined to 55,000,000 head. Further losses were recorded in 1945 and 1946. The numbers in Asia dropped from a prewar level of about 90,000,000 head to about 65,000,000 head. In South America there was an increase, particularly in Argentina, from about 3,700,000 head to 7,500,000 head. World statistics were incomplete and such estimates were only general approximations. The Combined Food board estimated in early 1946 that world meat production was slightly below the prewar level and 20% below unrestricted requirements.

The number of breeding hogs on United States farms remained at a fairly stable level from 1900 to 1940. The variation was from a low number of 47,800,000 head in 1902 to 64,000,000 head in 1919 following World War I and another peak in 1923 of 69,000,000 head. By 1937,

the number on farms as estimated by the U.S. department of agriculture had dropped to the very low number of 43,083,000 head, lower than in any year after 1888. This was explained by the small corn crop of 1936 and three years of the lowest prices in 25 years preceding 1936. In 1938 began a rapid increase in numbers which lasted to an all-time high record of 83,852,000 head in 1944. In 1945 there was a recession to about 60,000,000 head; there was a small increase to 62,300,000 head in Jan. 1946.

The true story of the growth in U.S. hog production was shown by the size of the annual pig crops of the decade 1937-46. Up to 1933 the total spring and fall pig production had been ranging from 70,000,000 to 84,000,000 head. Then it dropped to less than 60,000,000 head in 1934 and 1935. In 1937, the total was up to 62,519,000 head and increased rapidly to the record numbers of 104,500,000 head in 1942 and 121,706,000 in 1943, which was more than a third above the prewar average. A sharp reduction in numbers occurred in 1944, both in pigs raised and in breeding animals kept. The pig crop declined to about 88,000,000 head. The relative sizes of the spring and fall crops changed from year to year but usually in prewar years the spring crop was about twice the size of the fall output. Of the record crop of 1943, 74,034,000 were raised in the spring and 47,672,000 in the fall.

The prices of U.S. hogs fluctuated in long cycles. A low period occurred in 1932-35, when the price of breeding animals on farms declined to about \$4 per cwt. At Chicago, Ill., the average price of hogs in 1937 was \$8.46 per cwt. and in 1938 and 1939 declined to \$5.62 per cwt. In 1940 the price rise began and continued up to \$14 in early 1942. A top of nearly \$16 was reached in 1943 when in October a ceiling price of \$14.75 per cwt. was fixed by the government and was continued until May 1944. The ceiling on hogs weighing more than 240 lb. was reduced to \$14 in May 1944, and in Oct. 1944, the weight limit was raised to 270 lb. A support price was started at \$9 per cwt. early in 1941 and increased from time to time until it reached a level of \$13.75 in 1943 and was continued until Oct. 1944, when it was reduced to \$2.50 per cwt. The declining pig crop strengthened hog prices in 1946. Hogs sold at the ceiling through 1945 and the price increased to \$14.85 per cwt. when the general meat shortage became apparent in early 1946. During the period of strikes in packing plants in Jan. 1946, prices held close to ceilings. The subsidy of \$1.30 per cwt. to hog slaughterers was continued to June 30. The average price of hogs to wholesale slaughterers was the highest after the brief peak reached in 1919 immediately after World War I.

The number of hogs slaughtered under federal inspection in the U.S. averaged 34,262,000 head per year in the prewar period 1935–39. This total rapidly increased to 50,388,000 head in 1940, declined a little in 1941 and then increased to an all-time record of 69,017,000 head in 1944, after which year there was a decline to about 41,000,000 head in 1945 and a slight increase in 1946. This slaughter of hogs turned out a total of pork and lard amounting to 4,500,000,000 lb. in the prewar period 1935–39 and 9,400,000,000 lb. at the peak in 1944. Farm slaughter of hogs was estimated at 13,300,000 head in 1937 and increased to 13,800,000 head in 1944. Added to the inspected slaughter the total of hogs killed was about 53,900,000 head in 1937 and 96,849,000 head in 1944 at the top of the cycle of production.

The war experience showed several facts of basic im-

portance to the U.S. hog industry. The great increase in numbers to the peak in 1943 was too rapid in view of the feed situation and general meat-packing facilities. The decline in hogs on farms on Jan. 1 amounted to 28% from 1944 to 1945 or a total of 23,000,000 head. This was due partly to shorter feed supplies in 1944, gluts at stockyards and slaughter houses and a fear among producers that a sudden price decline might follow the war's end.

The total production of U.S. meats increased more than 40% during the war years but the civilian supplies rose only about 20%. Supplies were estimated at 56 lb. per capita in 1935-39; they increased to 76.7 lb. in 1944, then declined to 58.9 lb. in 1945, and remained at about the same level in 1946. The military supplies of pork began to be set aside in 1942, when 173,000,000 lb. were taken. This figure increased to 963,000,000 lb. in 1943; 1,382,000,000 lb. in 1944 and 1,718,000,000 lb. in 1945 and then began a rapid decline. The pork supply was so large in 1945 that civilians had the largest amount available at the same time that military needs were the highest. Other exports were not large during this period, amounting to only about 50,000,000 lb. Lend-lease allotments amounted to about 12% of the total supply in 1942, 14.6% in 1943, 11% in 1944 and 4% in 1945. (See also BACON; MEAT.)

Home Economics

Home economics during the decade 1937-46 grew strikingly both in the scope of the problems dealt with and in the number of individuals and families reached in the United States. In almost every place where home economics was taught, either in elementary schools, high schools or colleges, this expanded program included housing, its selection, arrangement, furnishing and equipment; food for the individual and family group; clothing, selection, care, construction and renovation; home management and consumer buying; family relationships; care and guidance of children; health and home care of the sick; house care and home laundry.

One of the most striking changes in viewpoint was the shifting of emphasis from the individual to the human side of home and family—particularly on the family in its responsibility toward attitudes, abilities and responsibilities in the community, the nation, the world.

The activities of home economics during this decade

The Ingersoll pre-assembled utility unit (upper left) in a low-cost home model exhibited in 1946. A central steel core conceals the heating apparatus as well as wire and plumbing outlets. Built around it are the facilities for kitchen, home laundry and bathroom

was well summarized by figures for the year 1942 when there were on record: 38,000 U.S. college students majoring in home economics in 350 colleges; 27,000 teachers of home economics; 2,600 extension and 2,300 farm security workers serving rural homemakers; 5,000 active dietitians; 450 names appearing in the directory of home economics research and 652 qualified members in the home economics in the business section of the American Home Economics association.

These years showed a greatly expanded use of home economics facilities for all age groups in the community and in schools and kept home economics laboratories busy for evenings, Saturdays and after-school classes in canning, clothing construction and renovation, care and repair of household equipment. Particularly during the war years, thousands of trained home economists gave help either as paid or volunteer helpers in connection with community nutrition, school lunch, Red Cross, Civilian Defense, conservation and rationing programs.

Both in high schools and colleges in this period there was a spread of the participation of the home economics program with the general education program to improve the citizenship training and general education of both men and women.

Men as well as women registered for college, university and adult education courses in nutrition, family relationship and child guidance. At the beginning of 1946, approximately 75% of the high schools in the United States offered vocational home economics courses, and two-thirds of the girls and 5% of boys were reached by this instruction. During these ten years the total number of

home economics students of the federally reimbursed programs grew in many communities. Particularly was this the case during the war years, when much attention was focused on adequate nutrition while there was rationing of food.

In 1936, the membership of the American Home Economics association totalled 10,388. By 1946, this membership totalled 16,637. During these eventful years a large number of students became members of high school and college home economics clubs throughout the United States. In 1936, home economics student clubs numbered 1,372, while at the beginning of 1946 this number had grown to 4,676 with a total membership of 186,013 students.

There was a marked growth in the prestige of this association during the decade, as evidenced by requests for representation at meetings called by other groups both national and international. These requests came from professional, educational, social welfare and business groups. The American Home Economics association was the first women's national organization to plan and carry out nation-wide registration at the beginning of the war (1941).

Consumer Education.—During the decade the American Home Economics association made rapid strides in its consumer education program. The association was very active in getting the American Standards association, which formerly had considered only engineering materials, interested in standards for household products such as refrigerators, bed sheets and blankets. It also helped organize and became the first consumer organization to join the National Consumer-Retailer council, an experiment in consumer-retailer co-operation.

It also brought into being a consumer education series

of informational leaflets. This was a series of newsletters and miscellanea, each of which was a discriminating collection of excerpts from abstracts of current literature relating to consumer problems and reports on newsworthy developments in the field. The leaflets provided a wealth of material for the consumer-buyer as well as valuable teaching material. In the war years they dealt largely with the effects of war on the consumer economy, held up standards of good consumer behaviour under wartime conditions and presented unbiased, constructive criticism of policies relating to civilian goods as evaluated by home economics standards.

These were years in which many members of the association increased their interest and activity in legislation of special interest to consumers.

They testified as consumers, homemakers and professionals before many congressional committees and the United States Food and Drug administration and Federal Trade commission.

The School Lunch bill, passed in June 1946, was one of the important bills actively sponsored by the association.

State Nutritionists.—Under the Social Security act, and encouraged by the children's bureau, health services were extended to mothers and children through grants-in-aid to state health departments. In 1936 there were ten nutritionists employed to act as consultants to physicians, nurses, dentists and other state-employed personnel in extending preventive health services to women before and after birth of their children and to infants, preschool children and children of school age. In 1946 this number had expanded to 49.

Research.—A perusal of yearly summaries of home economics in experiment stations in land-grant institutions in the United States showed that research in home economics increased steadily during the decade and broadened in scope.

Home economics research which up to the beginning of the decade had been confined largely to food and nutrition, expanded during the next ten years to include family economics, child development, home management, textiles and clothing, fatigue in housework, consumer economics, a combination of experimental cookery with household equipment and with home economics education.

Research in human nutrition used human subjects instead of rats and guinea pigs.

These were the years in which the first Ph. D. degree in home economics was conferred. Ph. D. degrees in home economics totalled 25 in this decade.

Foreign Scholarships.—Scholarships were supplied for foreign students who went to the United States to study home economics from China, Korea, Japan, India, New Zealand and South America.

Help was given by eminent home economists for furthering home economics work in several colleges in other countries.

Home Economics in Business.—Many more home economists were found in key business jobs in 1946 than in 1936. The largest number of women trained in home economics, however, naturally went into homes of their own to raise families. But careers for those trained in home economics expanded in number and scope in these ten years.

Bureau of Human Nutrition and Home Economics.— Through a reorganization within the U.S. department of agriculture in 1943, the bureau of home economics which had been a department of the U.S. department of agriculture from 1923 was made a part of the agricultural research administration. At that time its name was changed to the bureau of human nutrition and home economics. The number of research and popular publications prepared by this bureau grew from 35 in 1936 to 58 in 1946. Research supporting these publications expanded in rapid strides. The distribution of popular interpretations of basic research (as distinguished from the technical publications for use of scientists) grew from 1,585,200 to 17,363,400 in 1946.

The research program of the bureau of human nutrition and home economics reflected both current needs of the nation's families and their hopes for the future, with special emphasis on the adjustment of rural families and for basic studies of operating characteristics and performance requirements of home equipment.

The chief of the bureau was present officially and participated actively in the United Nations conferences at Hot Springs, Ark. in 1943, Quebec in 1945 and Copenhagen in 1946. (See also DIETETICS.)

Homma, Masaharu

Homma (1888?–1946), Japanese army officer, was an observer with the British forces in France during World War I. In 1925 he served as Japanese resident officer in India and in 1930 he was appointed military attaché in London, where he was decorated with the military cross of the British empire. In 1939, he commanded Japanese forces at Tientsin, China, when the Japanese army blockaded the foreign concessions there. In Dec. 1941, a few

days after Pearl Harbor, Homma, then a lieutenant general, led the Japanese invasion of the Philippines. Although it had been commonly supposed that Homma had been superseded by Gen. Tomoyuki Yamashita after the campaign bogged down at Bataan and Corregidor, subsequent evidence suggested that Homma held the supreme command throughout the campaign. He also directed "mopping-up" actions of stray American and Philippine forces in the Visayas and Mindanao area. Homma, who arrived in Tokyo to surrender to the U.S. army forces, Sept. 14, 1945, was brought to trial in December. He was formally charged with having been responsible for the "Death March on Bataan," which occurred shortly after the Japanese conquest and in which an estimated 17,200 Filipinos and Americans were killed. The trial opened in Manila, Jan. 3, 1946, with a military commission presiding. Convicted Feb. 11, for ordering the death march and for condoning other atrocities, he was sentenced to be shot. Homma's appeal to the U.S. supreme court was rejected. During the trial, his counsel asserted that Homma had issued instructions for humane treatment of prisoners of war, but that his subordinates, not wholly "motivated by the ideals" of the defendant, were continually changing and therefore, it was impossible to indoctrinate them all with Homma's views. The general was executed by a firing squad at Los Banos, Luzon, April 3.

Honduras

A republic of Central America, Honduras is bounded by Guatemala, El Salvador and Nicaragua. Area: 59,145 sq.mi., with some territory in dispute with Nicaragua. Pop. (1945 census), 1,201,310; by the 1940 census it was 1,107,859 and an official estimate in 1943 was 1,173,032. The capital is Tegucigalpa, the only Latin American capital without a railroad, with a pop. (1945) of 55,715 (by 1940 census, 42,-223). Other cities include San Pedro Sula (22,116 in 1945), La Ceiba (12,185 in 1945) and Tela (8,969 in 1940). The national population was estimated to include 86.4% mestizos, 9.54% Indians and 4.06% white, Negroes and orientals. During the decade 1937-46, the republic continued to have a unitary government with an elected president, commonly characterized currently as a dictator, a directly elected unicameral legislature of 45 members, and a judiciary headed by a supreme court of five members appointed by the congress.

Carías' Iron Rule.—The rule of Pres. Tiburcio Carías Andino was fully consolidated by 1937 (he had been president since 1933) and continued throughout the succeeding decade, although he was faced at various times with threats of revolution, occasionally as a reflection of disturbed conditions elsewhere in Central America. There was a minor revolutionary uprising in outlying districts in Feb. 1937, but it was quickly suppressed by government use of aeroplanes. An underlying cause of the attempted revolution was the serious economic difficulties occasioned by the abandonment of many banana plantations on the Caribbean side of Honduras because of inroads of the "Panama blight," a fungous disease that affected the soil and destroyed the plants.

The most dramatic development of 1937 was the socalled "postage-stamp war" with Nicaragua. The latter republic in Aug. 1937 issued a series of map postage stamps showing several thousand sq.mi. of land commonly credited to and officially claimed by Honduras as "territory in litigation." The development was a phase of the longstanding boundary controversy between the two countries. An acrimonious diplomatic correspondence ensued, followed by a severance of relations and the threat of border

Fliers of Honduras patrolled the republic's Atlantic coast line daily during the height of the German submarine menace, in co-operation with the U.S. antisubmarine forces

hostilities. Costa Rica, Venezuela and the United States offered mediation and on Dec. 10, 1937, the two disputants agreed to accept arbitration. Subsequent negotiation of an adjustment continued through several years, for the most part peacefully except that friction arose in Dec. 1938 when Nicaragua accused Honduras of importing arms in violation of the mediation agreement.

Conditions remained superficially calm in 1938 and 1939, although in some respects Carías maintained only a precarious control, relying especially on his prompt payment of army salaries and his cultivation of the small but efficient air force. Minor disorders occurred in April 1938. The economic situation during both years was difficult, although banana production tended to increase in 1939. In that same year, attention was given to the proposed large-scale production of hemp, a product previously produced only experimentally. The congress in 1939 repealed a law of 1937 creating a differential customs tariff for certain countries, and, at the same time, imposed a 50% duty on the products of some countries, principally those of Japan. On Dec. 18, 1939, the congress voted to extend the term of Pres. Carías to Jan. 1, 1949; the constitution adopted in 1936 had extended the president's term to Jan. 1, 1943.

Honduras in 1940 cast in its lot strongly with the program of western hemisphere solidarity which was then crystallizing. The government took steps to combat fifthcolumn activities and established compulsory military service in Aug. 1940. In March of the same year the congress adopted a new civil code to replace that of 1898. Continued improvement was apparent over the depressed economic conditions of the immediately preceding years. A significant agricultural development was the beginning of experimental rubber cultivation along the Caribbean coast, where 50,000 trees were planted and land was cleared for an additional 150,000 trees. This program was in line with the policy of the United Fruit company, chief foreign investor in Honduran agriculture, to diversify its interests in the face of the banana diseases which had seriously harmed that industry.

Honduras was politically quiet throughout 1941 in spite of rumours of revolutionary plots which circulated from

time to time. The government maintained close co-operation with the United States; in line with such a policy, it put under strict control the export of a variety of strategic materials to non-American countries, taking the action by decree on June 10, 1941. Early in the same year the German charge d'affaires was expelled for propaganda and other activities, and by Sept. 1941 all relations with Germany and Italy were severed.

Following the attack on Pearl Harbor, the congress, on Dec. 8, unanimously voted to declare war on Japan and four days later took the same action against Germany and Italy. Economic conditions were on the whole not good

during 1941.

War's Ill Effects.—Co-operation with the hemisphere defense program continued actively in 1942 in line with the policy adopted the previous year. The government widened the conscript-age limits (to 18 to 32 years for active service and 32 to 45 for the reserves) to increase the army's strength, purchased war materials and increased its defense budget. Axis-owned property was taken over, and control over the movement of United States currency was established. The president was authorized to borrow up to \$15,000,000 for defense and civil emergency needs, and a national bank was established to facilitate financial operations. Honduran economy was hard hit by a serious drop in banana exports; bananas had normally furnished about 65% of Honduran exports, and the wartime decision that available shipping to and from the United States had to be diverted to more essential needs affected Honduras more than any other Central American country. The Honduran government set in operation a policy of price control and conservation, although it was reported after some months of operation to be not too effective. In order to alleviate the unemployment situation in the banana areas, the government began a program of construction work on highways; the work employed approximately 1,000 men and at first emphasized completion of a road link to connect Tegucigalpa with the inter-American highway circling the Gulf of Fonseca through a small portion of Honduran territory.

Banana exports of Honduras fell off to about onefourth of normal output in 1943, with resulting unemployment and financial shortages to the government. In the latter part of the year, six vessels were added to the banana fleet, with some improvement of conditions. The United Fruit company intensified its diversification program for the north coast by expanding its planting of abacá as a hemp substitute; the program had been begun ,by a contract on Jan. 3, 1942, by which the fruit company agreed to plant from 7,000 to 30,000 ac. of abacá and to supply the fibre to the government. The same company established an agricultural school to study that and other production problems. One firm, producing dehydrated banana products, increased its output to full capacity in 1943. To ease unemployment to some extent, the government continued work on the inter-American highway project and other strategic roads; one of the most significant of these was the beginning of active work in 1943 on a highway link around Lake Yojoa in central Honduras, to remove the only important gap blocking highway access from Tegucigalpa to the north coast. A United States financial mission went to Honduras in June 1943 to aid in solution of fiscal problems; the government on March 18, 1943, authorized the importation and use of \$1,500,000 in United States currency.

The highly disturbed political situation in Central

America in 1944 had its repercussions, although it did not lead to revolution, in Honduras. In late May 1944, the government declared a state of siege (martial law) because of the revolution in neighbouring El Salvador. After the resignation, under pressure, of Pres. Jorge Ubico in Guatemala at the beginning of July, disorders occurred in Honduras, with the press reporting at one time that the president had resigned. The government managed to suppress the outbreaks that occurred, although for some weeks the situation continued to be extremely tense. Roving bands of oppositionists were again reported active in Oct. 1944 and sporadic guerrilla fighting took place throughout the rest of the year. Observers credited Carías' continued hold on power, in the face of successful revolutionary movements in neighbouring Guatemala and El Salvador, to the disorganization of his political opposition and to manoeuvring for leadership among the various groups opposed to

Honduras in Jan. 1944 signed the United Nations Relief and Rehabilitation administration agreement, and was later in the year visited by an U.N.R.R.A. mission which arranged for contributions. The first minister from China presented his credentials in Feb. 1944. Some agitation occurred during the year in favour of a break in diplomatic relations with the Franco government in Spain, but no concrete developments followed. A health and sanitation agreement, previously negotiated with a subordinate agency of the Office of Inter-American Affairs in the United States, was in April extended into 1947; in Nov. 1944 ground was broken for a new tuberculosis hospital to which the United States contributed half the cost of \$212,-500. Because of the need for agricultural training, the Pan American agricultural school at Zamorano was opened in October, before the original date planned; the United Fruit company granted \$500,000 in further backing of the institution. Inflationary trends continued in 1944, and Honduras suffered some scarcities of foodstuffs, manufactured items and gasoline. The government continued its road construction program as a means of relieving unemployment; the last steel bridge necessary on the Honduran section of the inter-American highway was completed during the year.

Only minor disturbances characterized Honduras in 1945. A small-scale attempt at revolt occurred in April, when relatively insignificant bands composed of political exiles made an invasion from Guatemala; skirmishes also occurred in the Copán area in the northwest. By the end of the same month the government reported that the revolt had been crushed. It was reported in Dec. 1945 that Pres. Carías had by decree freed the remaining political and military prisoners in Honduran jails as a pre-Christmas gesture. During a session of the congress in the early months of the year, a series of war emergency measures for World War II was approved, chief of which was one expropriating axis assets. War censorship was declared ended Sept. 12, 1945, and the state of siege declared early in the course of the war was lifted by congressional action Dec. 18. The United States disclosed in October that lend-lease military goods sent to Honduras during World War II amounted in value to \$313,000. The government established diplomatic relations with the U.S.S.R. late in March 1945.

In July 1945 the United Nations charter was approved by Pres. Carías and the congress took similar action in its December session. Honduras signed the Bretton Woods monetary pact on Dec. 28, 1945.

1942) improved significantly in 1945. Increased shipping, especially in the latter months of the year, brought the banana industry back toward normal. Severe food shortages, notably of sugar, were reported in August, however. The abacá industry was adversely affected by a severe drought during 1945. Rubber production continued on a small scale, although its future was uncertain. The Institute of Inter-American Affairs, a subordinate agency of the Office of Inter-American Affairs, terminated its food supply program in Honduras on June 30 and turned over to the Honduran government its food production and demonstration units. A severe hurricane on the agriculturally important north coast in October resulted in damage estimated at from \$10,000,000 to \$15,000,000. The congress on March 8, 1945, approved the application of a Honduran company for a domestic air line contract. Transportes Aéreos Centroamericanos (Taca) expanded its Honduran air services in 1945, making that country one of the best served by local air lines of all Latin American states. The government's wartime road construction program was virtually brought to a close in 1945 and it was estimated that some of the interior highway links had reduced trucking rates by more than one-third.

The government early in 1946 authorized the importation of an additional \$3,000,000 in United States subsidiary silver coinage. The congress on Jan. 1, 1946, took final steps to remove wartime restrictions on civilian freedom of action but at the end of June a "wave of terror" was reported directed by authorities against newspaper men and students. General economic conditions tended to improve in 1946 although inflation continued to be a serious problem.

Hong Kong

A British crown colony, Hong Kong is situated off the southeast coast of China at the mouth of the Canton river between latitude 22° 11′ and 22° 18′ N. and longitude 114° 7′ and 114° 16′ E. Area: about 391 sq.mi. Capital, Victoria: population (1940) 428,616. The estimated population of Hong Kong colony was: 1937 1,006,982; 1938 1,028,619; 1939 1,050,256; 1940 1,071,893.

The total for 1940 subdivided as follows into non-Chinese and Chinese civil population:

	Non-Chinese	Chinese
Island of Hong Kong	 9,920	456,450
Kowloon peninsula		379,816
New territories	 . 524	111,502
Maritime	 . 1,372	100,000
	24.125	1.047.768

To the grand total of 1,071,893 some 750,000 refugees must be added.

Governors: Sir Geoffrey Northcote (June 24, 1937–June 30, 1940); Lieut. General E. F. Norton (June 30, 1940–July 10, 1941); Sir Mark Young (July 10, 1941–Dec. 25, 1941); Lieut. General Rensuka Isogai (Dec. 25, 1941–Aug. 30, 1945) (Japanese governor); Rear-Admiral Sir C. Harcourt (head of military administration) (Sept. 9, 1945–May 1, 1946); Sir Mark Young (after May 1, 1946).

Although not directly involved in the fighting in the far east until the declaration of war on Japan by Great Britain and the United States in 1941, Hong Kong made some contribution toward China's resistance in the early years of the Sino-Japanese war. That its status as a free

port was of considerable advantage to China at the time when the China coast was blockaded and traffic by the Burma Road suspended was indicated by the fact that the value of imports to China via Hong Kong rose from 2-3% of China's total trade in 1936-39 to more than 7% in 1940.

Hong Kong had always been a field of free immigration for the Chinese, and by 1941 the influx of refugees was estimated at 750,000, or more than half the existing population. Housing facilities were stretched beyond their capacity, and this army of refugees added to the already complex social and health problems.

On June 30, 1941, his majesty's government ordered the evacuation of British women and children to Manila, and on July 27 Japanese troops took up stations on the land frontiers, thereby blockading the colony by land. On Dec. 10, the Japanese launched a heavy attack on the frontier, which was followed on Dec. 14 by an ultimatum to the garrison to surrender. This was rejected by the governor. The colony was then subjected to continuous artillery bombardment and air raids. Military and civilian casualties were heavy; important water reservoirs were lost to the Japanese, and water mains were destroyed by bombing. On Dec. 25 Hong Kong surrendered.

Under Japanese rule, health and sanitary conditions deteriorated, and some 16,000 Chinese tenements were rendered uninhabitable. When the British returned on Aug. 30, 1945, they found appalling sanitary conditions and transport and public utilities virtually nonexistent.

The formal Japanese surrender of Hong Kong by Major General Umekichi Okada to Rear Admiral Harcourt took place on Sept. 10, 1945, and for the first months after liberation the colony was administered by the British navy and civil affairs service jointly. Admiral Harcourt became commander in chief, Hong Kong. British military administration was terminated on May 1, 1946, and Sir Mark Young reassumed the governorship.

The colonial secretary announced on May 1, 1946, that the British government aimed at revising the constitution of Hong Kong on a more liberal basis, and that the governor had been instructed to examine this question in consultation with representatives of all sections of the community. In addition to this task the administration was faced in the summer of 1946 with several grave economic and social problems. Price control was difficult to enforce, the Hong Kong dollar became inflated, and the cost of living

Hoover, Herbert Clark

), U.S. statesman and gist presi-Hoover (1874dent of the United States, was born Aug. 10, 1874, in West Branch, Ia. He studied geology and engineering at Stanford university, Calif., graduating in 1895. Working as an engineer and technical expert, he took assignments in the western United States and later in Australia and China. After the outbreak of World War I, he organized the Commission for Relief in Belgium and upon the entry of the United States into the war in 1917, he was appointed U.S. food administrator by President Woodrow Wilson. Hoover became chairman after the Armistice of the American Relief administration, which distributed food to countries suffering from shortages caused by the war. In 1920, he entered President Warren Harding's cabinet as secretary of commerce. In 1928, as Republican nominee for president, he defeated the Democratic candidate, Gov. Alfred E. Smith. He was renominated for the presidency in 1932, but was defeated by Franklin D. Roosevelt.

During World War II, the former president re-emerged on the public scene and in Sept. 1943 he obliquely criticized the Allied thesis of "unconditional surrender," expressing his belief that an Allied statement of terms for a "provisional peace" would end the conflict more quickly. After conclusion of the United-Nations conference in San Francisco, Calif., Hoover said that he believed the senate should ratify the U.N. charter, but stipulated that the U.S. delegate to the security council should "in some way be responsible to congress before our country is committed to war."

On March 5, 1946, it was disclosed that Hoover, at President Truman's request, had agreed to investigate food conditions in Europe. Subsequently appointed "honorary" chairman of the president's Famine Emergency committee, Hoover toured the greater part of Europe and the far east. On returning to the United States, he reported on the results of his mission on May 13, 1946, declaring that the world grain shortage of 3,600,000 tons could be alleviated by better co-operation from Britain and the soviet union plus more vigorous conservation measures in grain surplus countries.

Hopkins, Harry Lloyd

Hopkins (1890–1946), U.S. politician, was born Aug. 17, 1890, in Sioux City, Ia. He was graduated from Grinnell college (Iowa) in 1912 and then went to New York, where he engaged in social service work. He was called to Albany in 1931 by Franklin D. Roosevelt, then governor, to take the post of executive director of the New York state temporary relief organization. When Roosevelt became president, he called Hopkins to Washington in 1933 to take over the post of federal emergency relief administrator. Convinced that U.S. people preferred work to a dole, Hopkins helped meet the unemployment problem by organizing and directing the Civil Works administration, the Federal Surplus Relief corporation and the

Works Progress administration. In the next five years, during which Hopkins expended some \$10,000,000,000 for relief, he was the target of both high praise and violent criticism.

By 1938 he had become a close adviser and personal friend of President Roosevelt, and the latter named him secretary of commerce in that year. Two years later, ill-health forced him to resign. In Jan. 1941, however, Hopkins went to London as the president's personal envoy. On March 27 of that year, he was named lend-lease coordinator and journeyed to both London and Moscow to confer with high government officials on the U.S. aid program. He was chairman of the Anglo-American Munitions Assignments board (1943) and attended the principal war conferences at Washington, Casablanca, Quebec, Cairo, Tehran and Yalta.

He also was named to a special committee to study manpower problems.

After the death of Roosevelt in April 1945, Hopkins remained to advise and assist President Truman. His last diplomatic mission was to Moscow, where (Mav-June 1945), he laid the plans for the Potsdam conference of the Big Three. His influence with Premier Stalin later smoothed over a snag at the San Francisco conference, where the United Nations were deadlocked over the issue of freedom of discussion in the security council. Hopkins resigned as adviser to Pres. Truman on July 3, 1945, because of his failing health. Hopkins accepted the chairmanship of the Woman's Cloak and Suit Industry in September, succeeding former Mayor James J. Walker. He died in New York city, Jan. 29, 1946.

Hops

The U.S. production of hops increased from 1938-44 except for the poor year 1942. The acreage did not increase much from 1937-44, when it was still below the previous high point of 39,100 ac. harvested in 1938. In 1945, the acreage was expanded to 41,000 ac. on which the record high yield of 1,379 lb. per acre brought the alltime record crop of 56,700,000 lb. The crop of 1946 was 53,171,000 lb. A low price of 9.8 cents per lb. for the big crop of 1935 led growers to restrict picking in 1936, reducing the average yield to only 816 lb. per ac. The price rose to 27 cents per lb. in 1936, and in 1937 a crop of 43,-900,000 lb. was harvested. Bad weather checked the increasing production in 1942; labour shortage was also a retarding factor. Prices advanced steadily through the decade to a top of 64.9 cents per lb. for the crop of 1944. The total value of the hop crop advanced steadily after 1938, when it was \$6,346,000, to \$30,967,000 in 1944.

The consumption of hops by breweries made only a small increase during the decade, from 36,608,000 lb. in 1936 to 37,240,000 lb. in 1944. The excess production was mostly absorbed by heavier exports, which averaged about 8,000,000 lb. from 1939-44. Only very small imports were made after 1940. The hop industry continued to be confined to the Pacific Coast, and production in the old hopgrowing regions of the east were not revived. Hop growing in England and Wales was not restricted during World War II from the 26,300,000 lb. of 1937 and continued at around 27,000,000 lb. The hop production of Europe was est. at 62,000,000 lb. in 1938 but declined as the war pro-

U.S. Hop Production by Leading States, 1937-46 (In millions of pounds)

gressed. Germany, Poland, France, Czechoslovakia and the Balkans, the principal producers, all had a declining output which had only begun to recover in 1946. The destruction of much of the brewing industry in Germany destroyed the market for hops.

Hore-Belisha, Leslie

Hore-Belisha (1895-), British statesman, was educated at Clifton college, at Paris, Heidelberg, and at St. John's college, Oxford. During World War I he served in the army, reaching the rank of major. He represented the Devonport division of Plymouth in Commons from 1923 as a Liberal; after 1931, he held the seat as a Liberal-Nationalist. Holding office first as parliamentary secretary to the board of trade in 1931 and then financial secretary to the treasury in 1932, he was minister of transport from 1934-37. On Baldwin's resignation in May 1937, Hore-Belisha became secretary of state for war. He resigned from this position in Jan. 1940 ostensibly because of friction with the general staff, which frowned at his attempt to democratize the army. As a member of parliament during World War II, he was a vigorous spokesman for liberal and internationalist policies. He proposed a plan for common British-U.S. citizenship, criticized the Churchill administration for compromising with undemocratic groups, and urged the opening of an early second front against Germany. He resigned as Liberal-Nationalist party chairman in March 1940 and as a member of that party in Feb. 1942. In July 1945 he was defeated in the parliamentary election.

Horse Racing

That horse racing should have shared in the general expansion and inflationary movement that marked the decade 1937-46, affecting the entire American scheme of life, was to have been expected, but few of the turf's most optimistic promoters could have foreseen the proportions which this process attained. Perhaps the most condensed and effective evidence was afforded in the statistics of the decade:

Year	Horses raced	Days of racing	No. Races run	Amt. of Money distributed
1937	11,515	2,140	16,250	\$14,363,562
1938	12,185	2.140	16,243	14,946,609
1939	12,804	2,199	16,967	15,312,839
1940	13,257	2.096	16,401	15,911,167
1941	13,683	2.162	16.912	17,987,225
1942	12,614	2.228	17.539	18,136,118
1943	11,258	2.052	16,094	18,555,680
1944	12,959	2.396	19,228	29,159,099
1945	14,307	2,480	19.587	32,300,060
1946 (est.)	15.642	3.020	23,941	49.289.144

Prosperity.—This growth was unprecedented in turf history, through a period when many deterrents interfered from time to time. It was natural that the United States' entrance into World War II in 1941 should have been followed by much doubt and anxiety regarding the status and possible complete suspension of racing. Suspension, however, did not materialize, although governmental moves in that direction were not wanting and at one stage as-

Seabiscuit and War Admiral in their match race Nov. 1, 1938, at Pimlico track, outside Baltimore, which finished with Seabiscuit ahead by six lengths

sumed an attitude so hostile that many horsemen endeavoured to prepare for the worst. That it did not eventuate was probably due to two causes: (1) the fact that the immense taxation revenue derived by many states from the sport would have been wiped out, and (2) the accompanying fact that the suppression of racing, bound to be intensely unpopular under any circumstances, could not logically be carried out unless all other major sports were also suspended. The partial "blackouts" that were enforced in various states proved, in the last analysis, futile, as did the arguments advanced in their support.

In California, the meetings at Santa Anita were discontinued through the three seasons of 1942, 1943 and 1944; when resumed in 1945, their success eclipsed all previous records and came to a climax when 80,200 persons paid admission to see the running of the \$100,000-added Santa Anita Handicap on March 9, 1946, this being the largest number ever known authentically to have attended a horse race in the U.S.A.

Through this period the Kentucky Derby, although governmental efforts were made to force its calling off, was renewed every season with conspicuous success; its money value of \$75,000-added was steadily maintained, and in 1946 was raised to \$100,000. The natural desire of the public for a means of diversion from the intense national strain was irresistible, heightened as it was by the vast outflow of money which the war precipitated. By 1944 the total volume of race-track betting in North America had

risen above the billion mark, registering \$1,209,973,122. In 1945, it increased to \$1,388,230,192, and a single commonwealth, New York state, alone had derived over \$500,000. ooo in taxation revenue from this source. Wagering on the 1946 Kentucky Derby totalled \$1,202,474; this was the first time in world turf history that \$1,000,000 or more had been bet upon a single race. No single day's program had yet produced a "handle" (the vernacular term for the amount passing through the totalisator) of \$5,000,000, but \$4,000, 000 was exceeded on several occasions at New York and California tracks. The combined revenues of the managements from the "take" (percentage of the "handle" allowed them by law) averaged about 121/2% for some 20 different states with legalized betting. The large gate admissions in turn permitted expenditures that would have seemed astronomical a decade before. Stakes with \$100,000 added money no longer excited any commotion, whereas in 1937 the Santa Anita Handicap was the sole event of that class, those carrying \$50,000 had become almost commonplace. At Belmont Park in 1946 an overnight purse worth \$25,000 was programmed; this was precisely the same amount with which, in 1937, the principal annual stake event, the classic Belmont for three-year-olds, had been endowed. Almost 50% as much money was distributed to stake winners alone in 1946 as had been awarded to all classes of horses, in both purses and stakes, ten years before-approximately \$6,000,000. But the bulk of the money, as always, went to the rank and file of the overnight "platers."

Such money-winning possibilities entirely changed the former custom of scaling the capacities of thoroughbreds according to the amount of their earnings. By winning the Santa Anita Handicap of 1946, War Knight netted his owner \$101,220, whereas any horse earning that much through his entire career formerly ranked among the élite of all time; many of the best animals of the 19th century never compiled totals of as much as \$50,000—and some less than \$25,000. In 1946, the leading money-winner, the King Ranch's three-year-old Assault, amassed a net total of \$424,195, to displace the long-standing record of \$308,275 established by William Woodward's Gallant Fox in 1930. The following table gives the leading money-winners of the decade:

Year	Horse and owner	Races won	Money won
1937	Seabiscuit, b c, 4 (C. S. Howard)	 11	\$168.580
1938	Stagehand, b c, 3 (Maxwell Howard)	 8	189,710
1939	Challedon, b c, 3 (W. L. Brann)	 9	184,535
1940	Bimelech, br c, 3 (E. R. Bradley)	 4	110,005
1941	Whirlaway, ch c, 3 (Calumet Farm)	 13	272,386
1942	Shut Out, ch c, 3 (Greentree Stable)	 8	238.872
1943	Count Fleet, b c, 3 (Mrs. John Hertz)	 6	174.055
1944	Pavot, br c, 3 (W. M. Jeffords)	 8	179,040
1945	Busher, ch f, 3 (L. B. Mayer)	 10	273,735
1946	Assault, ch c, 3 (King Ranch)	 8	424,195

All records for an individual horse were twice lowered during this period. At the start of the decade, honours were held by Sun Beau at \$376,744, which he earned through the five seasons of 1927-31 inclusive. In 1940, Seabiscuit closed a career of six seasons (1935-40) with a grand total of \$437,730. That same year Whirlaway made his début as a two-year-old, to remain before the public four seasons, during which he amassed \$561,161; he started in 60 races, won 32, ran second in 15 and third in 9. The first horse to reach the half-million mark, Whirlaway's tenure of supremacy looked secure for years to come-but in 1946 was seriously threatened by Stymie, a horse bred, like Assault, at the King Ranch in Texas but weeded out of its racing stable as a two-year-old for only \$1,500 as worthless. Stymie's climb up the ladder, one of the romances of racing, began as a three-year-old and he retired in the fall of 1946 with a credit of \$516,285 and the prospect of making an-

other successful campaign in 1947 which might place him at the top of the roster. Two other money-winning records of importance were established in 1945-46, when L. B. Mayer's three-year-old filly Busher took the title for her sex with a credit of \$334,035, displacing Top Flight and her \$275,900 (established in 1931); the gelding record was placed at \$385,175 by Calumet Farm's Armed, displacing the \$332,250 of Phar Lap noted above.

Calumet Farm (Warren Wright) just missed the millionmark in 1944, when horses bred there earned \$990,612. The previous leading breeder was H. P. Whitney, whose home-bred horses as far back as 1927 had won \$718,144. In 1944, Calumet Farm's racing stable likewise placed to its account \$601,660 in stakes and purses, after having previously captured \$475,091 in 1941, up to which date \$438,849, won by the Rancocas Stable of H. F. Sinclair in 1923 had held the lead. In number of race winners, Hirsch Jacobs overshadowed all other trainers by saddling the largest number in seven of the ten seasons of the 1937-46 decade. His average had been over 100 annually since 1989; in 1936 he established a single-year record of 177.

Jockeys enjoyed similar opportunities and made the most of them. In 1945, Johnny Longden rode the winners of \$981,977. Ted Atkinson, leading race-winning jockey in both 1946 and 1944, earned an income of as high as \$92,000 in 1945; he received a retainer of \$20,000 for first call on his services at a single meeting. Incomes of the leading trainers were not made public, but more than one undoubtedly exceeded the \$100,000 mark.

Winners of Important Stakes-1937-1946

NOTE:—The Kentucky Derby is America's richest and most famous three-year-old stake and is a dash of 1 ½ mi. run at Churchill Downs, Louisville, Ky. The Santa Anita Handicap is the richest event for horses of all ages and is a dash of 1½ mi. run at Santa Anita Park, Arcadia, Calif. The Futurity is the leading two-year-old stake and is a dash of 6½ furlongs run at Belmont Park, Hempstead, Long Island, N.Y.

Breeding.-The money flooding the race tracks naturally reached the breeding branch of the industry. During the long depression of the 1930s, blood-stock values experienced a disastrous deflation; in 1932, the average price paid publicly for yearlings fell to \$569.95, from a high of \$3,207.53 in 1925. The recovery was slow, but by 1937 the price had climbed back to \$1,675.96. Another decline set in with the outbreak of World War II, and the U.S. entry into hostilities in 1941 caused another severe slump. The 1942 average price was \$637.75, as the governmental threat

of closing all the tracks produced a panic among buyers. When this threat was not carried out, the reaction was immediate. A "bull market" was inaugurated in 1943 with an average of \$1,865.99; this price more than doubled in 1944 at \$3,916.93, soared to \$5,146.37 in 1945 and then to \$6,031 in 1946. The U.S. yearling record of \$75,000 paid in 1928 was not threatened; a high of \$66,000 was registered in 1942, while in the fall of 1946 a sensation was produced when Mrs. Elizabeth N. Graham paid \$50,000 at private sale for the weanling colt, own brother to Busher, by War Admiral-Baby League. The purchase was made in the liquidation of the estate of E. R. Bradley, of Idle Hour Farm, Lexington, Ky., who had died shortly before.

High class stallions and brood mares became virtually unbuvable, while the books of the most successful sires as a rule were filled for seasons in advance. The moneywinning records for the season's premiers left all previous ones far behind. Up to 1937 the record for America was \$422,200, won by the get of Sir Gallahad 3rd in 1930; that for England was \$378,535, won by the get of Blandford in 1934. In 1942, a new figure of \$437,131 was registered by the get of Equipoise, who had been dead four years (Aug. 5, 1938). During 1945 occurred the first instance of the sons and daughters of a single sire reaching the half-million mark, those of War Admiral winning \$591,352. Their achievement was enhanced by the fact that there were only 26 of them performing, War Admiral being a young sire in the early stages of his career. War Admiral was deeply bred in the old-established American blood-lines, being a son of Man o' War and Brush Up, by Sweep. He was bred and owned by Samuel D. Riddle, also owner of War Admiral's sire, the most famous thoroughbred of modern

Shadows.-Along with its prosperity, however, the turf disclosed weaknesses and unfavourable aspects not to be ignored. Many observers considered that racing sooner or later would collapse of its own top-heaviness, as it had previously more than once. In the metropolitan New York area alone there were four major tracks, plus three in New Jersey, while promoters were reported busy at the end of 1946 with plans for still others. Maryland had four major tracks and an extensive chain of minor ones. Chicago had four major and one minor track. Within a relatively small area in Southern California, extending just over the line into Mexico, there were four major tracks. There were three adjacent to Miami, Florida. In Detroit, where there was but a single plant, meetings were extended to great lengths; at Providence, R.I., with two suburban tracks, Narragansett Park and Pascoag, over 150 days of racing were given annually. Numerous similar instances could be cited. Plants known familiarly as "merry-go-rounds" were located in outlying communities such as Wheeling, W. Va.; Akron, Hamilton and Columbus, O., and elsewhere.

The immense growth of race-track betting also gave rise to much criticism, not only from the professional "reform" element, but from many different classes of persons interested in a high standard of public affairs. The tremendous number of women patrons and the strenuous endeavours of managements to attract their patronage produced many protests. Though all state laws governing race-track betting continued to forbid the participation of minors, lax officials winked openly at this prohibition. The truly cancerous growth of potential evil, however, was the nation-wide network of "off-track" and wholly illegitimate betting establishments.

Outcries about the alleged "crookedness" of racing did not, however, apply except to the cheapest and most disreputable meetings. Generally speaking, supervision at the reputable ones was strict, vigilant and effective; the results left little room for criticism.

From the purely sporting standpoint, the 1937–46 decade was memorable for the performances of some of the greatest thoroughbreds ever seen in America. Such horses as Seabiscuit, War Admiral, Challedon, Whirlaway, Alsab, Market Wise, Shut Out, Count Fleet, Busher, Armed, Assault, Stymie, Twilight Tear, Eight Thirty, Stagehand, Lucky Draw, Bimelech, Pavot, Attention, Devil Diver, Fénélon, Bolingbroke, Honeymoon, Gallorette and others left indelible marks upon the records.

Harness Racing.—While the progress of harness racing did not equal that of the thoroughbred, it made great gains during the decade. In both the racing and breeding aspects, it experienced a real renaissance, even though some of these gains were inevitably accompanied by retrogression along other lines. Outstanding features were the virtual "making over" of the racing system to conform closely to the running pattern; the abolition of all time bars in the classification of performers; and the substitution of dash for heat racing to a large extent, together with protracted meetings of the promoter-tax-revenue type.

In 1946 the Hambletonian Stake, trotting equivalent of the Kentucky Derby and after its inception in 1926 the richest harness race in the world, was displaced as such by two dash events with purses of \$50,000 each—both unsatisfactory contests won by horses of inferior class. The great increase in the earning capacities of both trotters and pacers, as with the runners, caused a tremendous inflation in values, especially those of yearlings and two-year-olds. Up to 1937, the highest price ever paid for a yearling trotter at public sale was \$13,500; it rose to \$37,000 in 1944. For a two-year-old (Hoot Mon) \$50,000 was given privately in 1946.

The close of World War II brought a new influx of foreign buyers from various European countries and resulted in the sale to Italy of the stallion Doctor Spencer for \$50,-000, together with the export of a large number of other animals at high prices.

One supremely great trotter dominated the decade—the gray gelding Greyhound, whose record-breaking achievements were without precedent. Among them were the

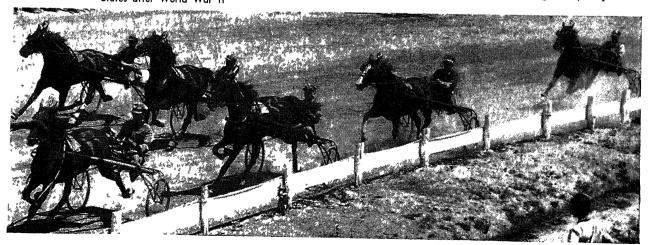

Trotting race at Goshen, N.Y., in the summer of 1944. Public interest in harness racing reached a new high level in the United States after World War II world's record for one mile at 1:55½; for a mile and a half at 3:02½; for two miles at 4:06; for a mile in a race at 1:57½; for a mile over a half-mile track at 1:59¾; and that for a double team at 1:58¼, made to pole with the trotting queen Rosalind 1:56¾ (the latter reduced the mares' record from 1:58¼ in 1938). Greyhound was bred in Kentucky by Henry H. Knight and was owned by E. J. Baker of Illinois, who bought him as a yearling for only \$900. Next to Greyhound, the greatest trotter of the decade was probably the bay colt Titan Hanover, who lowered the mark for two-year-olds from 2:02 to 2:00, and for three-year-olds from 1:58½ to 1:58. He was bred at Hanover Shoe Farms, Hanover, Pa., and sold as a yearling in 1943 for \$3,000 to E. Roland Harriman and Elbridge Gerry, of New York.

In 1941, the record for trotting stallions, which had stood at 1:58½ ever since 1916, was lowered to 1:57½ by the four-year-old Spencer Scott, bred in Kentucky by David M. Look and sold privately as a yearling to C. W. Phellis. On the pacing side the decade was made memorable by the bay colt Billy Direct, bred in Tennessee by H. H. Ridge, of Massachusetts. He first lowered the three-year-old record from 1:59½ to 1.58 in 1937 and then, at four, the world's record, regardless of sex or age, from 1:55¼ to 1:55.

XVI, XVII and XVIII. (J. L. HE.)

Racing in Britain.—The ten years covering the period 1937–46 were certainly eventful ones in the history of the turf in Britain, if for no other reason than that racing was kept going, although only on a skeleton scale, during the war years, in spite of shortage of forage and labour, difficulties of transport, the rival claims of the ploughing campaign which sorely depleted the studfarms, and the severe curtailment of both racing and breeding stock. Had racing been allowed to lapse entirely, the breeding industry would have suffered a set-back beyond recovery, and many of the best strains of blood which may well be regarded as a national asset would have been lost in obscurity. A total stoppage occurred from June 19 to Sept. 14, 1940, after which a partial program was carried out on certain courses only, but principally at Newmarket.

During 1942, 1943 and 1944, racing was conducted on a regional basis, being confined to horses trained within a specified area, the only exceptions to this rule being the five classic races and a very few other specially important

Grinning happily, Jockey Warren Mehrtens is shown leaving the winner's circle where Assault stood with his owner, Robert J. Kleberg, after winning the 1946 Kentucky Derby purse of \$96,400 on May 4, 1946

events. An alternative concession was made in the case of the Cambridgeshire and Cesarewitch. As it was not feasible to transport the large number of horses which usually compete, separate races with similar conditions were run in each of the three regions, these being respectively designated the Newmarket, Ascot and Northern Cambridgeshire and Cesarewitch.

From 1940-45 inclusive, the Two Thousand guineas, One Thousand guineas, Derby, Oaks and Ascot gold cup were run at Newmarket, and the St. Leger on various courses other than at Doncaster.

Below are given the winners of the principal events during the decade:

```
The Derby

1937 Mrs. G. Butt-Miller's Mid-day Sun (ridden by M. Beary)
1938 Peter Beatty's Bois Roussel (C. Elliott)
1940 Feter Beatty's Bois Roussel (C. Elliott)
1941 Mrs. Macdonald-Buchanan's Owen Tudor (W. Nevett)
1942 Mrs. Macdonald-Buchanan's Owen Tudor (W. Nevett)
1943 Miss Dorothy Pager's Straight Deal (T. Carey)
1944 Lord Rosebery's Ocean Swell (W. Nevett)
1945 Sir Eric Ohlson's Dante (W. Nevett)
1945 Sir Eric Ohlson's Dante (W. Nevett)
1946 J. E. Ferguson's Airborne (T. Lowrey)

The Oaks
1937 Sir Victor Sassoon's Exhibitionnist (S. Donoghue)
1938 Sir Hugo Cunliffe-Owen's Rockfel (H. Wragg)
1939 R. Sitrling Clark's Galdatea II. (R. A. Jones)
1940 Esmond Harmsworth's Godiva (D. Marks)
1941 John A. Dewar's Commotion (H. Wragg)
1942 His Majesty's Sun Charlot (Gordon Richards)
1943 James V. Rank's Why Hurry (C. Elliott)
1944 William Woodward's Hycilla (G. Bridgland)
1945 Lord Derby's Sun Stream (H. Wragg)
1946 Sir Alfred Butt's Steady Aim (H. Wragg)
1947 The St. Leger
1937 Lord Glanely's Chulmleigh (Gordon Richards)
1938 James V. Rank's Scottish Union (B. Carslake)
1940 No race, war being declared in the week preceding the fixture.
1940 The Aga Khan's Turkhan (Gordon Richards)
1941 Lord Portal's Sun Castle (G. Bridgland)
1942 His Majesty's Sun Charlot (Gordon Richards)
1943 Lord Derby's Herringbone (H. Wragg)
1944 The Aga Khan's Turkhan (Gordon Richards)
1945 Squadron-Leader Stanhope Joel's Chamossaire (T. Lowrey)
1945 J. E. Ferguson's Airborne (T. Lowrey)

```

As regards individual merit, it was generally considered that Blue Peter, winner of the Two Thousand guineas, Derby and Eclipse stakes of 1939, and favourite for the St. Leger abandoned on the outbreak of war, was a Derby

winner of more than average class; while there was no doubt that Dante was a colt of exceptional brilliance, winning all his six races as a two-year-old, and the Roseberry stakes and Derby at three years, his only defeat being when Court Martial beat him by a neck in a field of 20 for the Two Thousand guineas.

Of other classic winners during the war period, although such racing as was permissible was of inestimable advantage to the breed of the racehorse, the opportunities available were in general scarcely sufficient to allow any one horse to stand out in any very marked degree from his contemporaries. Dante, however, was an exception, and another very notable one was Sun Chariot, who won eight of her nine races, including the One Thousand guineas, Oaks and St. Leger. This filly was bred by the national stud in 1939, and leased to King George for her racing career, as was also Big Game, an unbeaten two-year-old of 1941, and with whom his majesty won the Two Thousand guineas the following season, the royal colours thus being successful in four of the five classic races of 1942.

On the whole, the decade was apparently more remarkable for the production of good fillies than good colts. It may be noted that the above list of ten Oaks winners contains the names of two exceptionally good fillies in addition to Sun Chariot, these being Rockfel and Godiva, each of whom won the One Thousand guineas as well as the Oaks, a feat also accomplished by Exhibitionnist. Others meriting special mention were Garden Path, winner of the Two Thousand guineas of 1944, and the only filly to have done so since Sceptre's victory in 1902; Herringbone, who

The Grand National steeplechase at Liverpool, England, held in April 1946, was the first in 6 years. All but 6 of the 34 entries were thrown at one or another of the treacherous jumps shown below "Lovely Cottage" was the 1946 winner won the One Thousand guineas as well as the St. Leger, Ribbon, winner of the Middle Paik stakes, and second in the One Thousand guineas, Oaks and St. Leger, in which last race she defeated the Derby winner, Straight Deal; and the list would be incomplete without the inclusion of Afterthought, winner of the Jockey Club cup of 1942, over the two-and-a-quarter-mile, and second in the Gold Cup won by Owen Tudor.

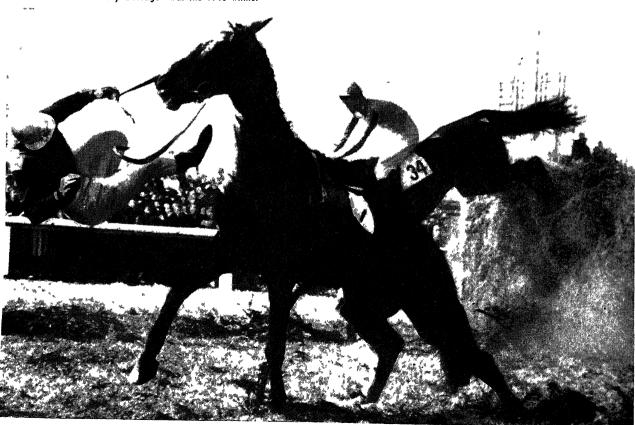

Godiva unfortunately died in the course of her threeyear-old career, and Rockfel also came to an untimely end, succumbing soon after her first foal was weaned.

Wartime privations appeared to affect French horses to a lesser degree than the English, as those sent over to contest the long-distance races of 1946 exhibited staying qualities of a high order, their victories including the Gold Cup and Alexandra stakes at Ascot, and also the cups at both Goodwood and Doncaster.

An outstanding feature during the period was the success of the stock of Lord Derby's Hyperion (himself a winner of the Derby and St. Leger), who in nine seasons up to the end of 1946 had sired 133 individual winners of 308 races in England and Ireland, to the value of £219,327.

These figures were the more remarkable in view of the limited opportunities afforded, as for six of these years racing was drastically reduced, the entire amount of stakemoney in England during the five seasons 1940–44 amounting to only £787,893, whereas in the single year 1938 the sum available for competition was £731,826.

The great achievements of Hyperion as a stallion were best instanced by the record of his offspring in the classic races in the short term of eight years, in which he sired a winner of the Derby, two of the St. Leger, and four of both the One Thousand guineas and Oaks; second three times and third twice in the Derby and also in the Two Thousand guineas; twice second and twice third in the St.

Leger and the same in the Oaks, second once and third three times in the One Thousand guineas.

Fairway, another of Lord Derby's stallions, got three winners of the Two Thousand guineas (Big Game, Kingsway, and Garden Path), and two of the Derby (Straight Deal and Watling Street), between the years 1939 and 1944, besides being paternal grand-sire of Lambert Simnel, Court Martial (both winners of the Two Thousand guineas), and Ocean Swell (Derby).

In the early part of the war (1940-41) the value of bloodstock was almost negligible, but an improvement became manifest the following year, especially as regards the better class stock, and from 1943 onwards prices steadily increased.

Even as early as Dec. 1942, the six-year-old Olein, covered by Hyperion, realized 17,000 guineas at auction, a sum which had only once before been equalled, and never exceeded, for a brood mare, while in 1945 all previous records for animals of their age were broken when a yearling colt (subsequently named Sayajirao), own brother to Dante, by Nearco out of Rosy Legend, was sold for 28,000 guineas, and a colt foal by Hyperion, Blanco, for 7,200 guineas, the previous highest prices having been 15,000 and 5,000 guineas respectively. (F. M. Pr.)

The King George VI stakes (of 50 sovereigns each with £5,000 added) was run for the first time over a two-mile course at Ascot on Oct. 12, 1946, and won by the French three-year-old Souverain owned by F. R. Schmitt (jockey, M. Lollierou), with Bright News, owned by W. W. H. Macdonald (jockey, M. Wing) second and Airborne, owned by J. E. Ferguson (jockey, T. Lowrey) third.

Horses

The iron horses—the gasoline truck and tractor—continued steadily to eliminate the horse as a draught animal during the decade 1937—46. The number of horses in the United States had increased until 1915, and the number of mules reached a high peak in 1925. The stronger resistance of the latter was attributed to the larger numbers used in the cotton industry, for which mechanical power developed more slowly. The total number of horses and mules on farms in Jan. 1946, 11,455,000, was less than half the all-time record number of 26,700,000 in 1918.

The horse disappeared most quickly and completely in the cities. In 1910 there were about 3,500,000 horses enumerated as not on farms, while in 1945 the number was estimated to be only 200,000. The number of mules declined from 387,000 in 1910 to 75,000 in 1930.

During 1937–46, the number of horses declined from 11,342,000 on Jan. 1, 1937, to 8,259,000 on Jan. 1, 1946. The number of mules dropped from 4,460,000 in 1937 to 3,196,000 in 1946. This total of horses would allow only about one and one-third per farm. The number of tractors on farms was estimated to be 1,231,000 in 1937 and 1,953,000 in 1944, together with 1,080,000 motor trucks in the latter year. Farm automobiles were estimated at 4,100,000 in 1944. The increased use of trucks and tractors in cities was also the chief factor in eliminating the horse there.

Previous wars had created a special demand for draught animals, especially mules. Prices rose sharply in Sept. 1939 in anticipation of a demand during World War II, but dropped within a few months when it became evident that the motorization of armies was proceeding rapidly. Another demand for animals to replace the reduced supply of tractors did not materialize. Some foreign armies bought several thousand horses and mules which were never shipped and were sold later at reduced prices. The US. army purchased and used a few hundred animals in the

U.S. army horses training for hurdle jumping in 1942 at Front Royal, Va. They were given 80–120 days of training for military service

South Pacific operations. There was also a decline in the number of riding horses because of the closing of riding stables and the restrictions on gasoline to travel to these recreation centres. Horse breeding on farms declined in 1942 until there were not enough colts to provide for replacements for farm horses. The annual disappearance of old horses was greater than the number of colts raised for several years. Foreign trade in horses had never been great and was confined to small numbers of breeding stock.

The slaughter of horses increased in 1943, when 56,500 head were killed under federal inspection. Some of these animals were imported from Canada and Mexico and others were wild horses from the western range country. The horse meat was used chiefly for pet-stock foods, tankage and bonemeal, and a small quantity was exported to countries using horse meat for human consumption. The high price of meat led to the slaughter of more than the usual number.

Prices of horses averaged \$88.50 per head during the fiveyear period 1935-39 compared with an average of \$136.00 per head in the period 1909-14. Mules were more valuable than horses, selling for \$106.10 and \$153.90 per head for the same periods. By the spring of 1946, the average farm price of horses had dropped to \$58.00 per head and mules to \$108.00 per head.

The number of light horses for racing and riding was estimated at about 20,000 head of all types in 1946 and was not increasing. The main handicap to riding continued to be the lack of bridle paths free from automobile traffic.

The number of horses and mules exported by U.N.R.R.A. was small until 1945, when ships were remodelled to haul them. Many boatloads were sent in 1946. In July 1946, U.N.R.R.A. reported that the deliveries of work animals were as follows for certain countries; Greece, 18,600 head;

Yugoslavia, 17,800; Poland, 40,000; Czechoslovakia, 4,500; and Italy, 800. Most of these were sent from the United States but U.N.R.R.A. purchased horses in all countries that had a surplus for sale. Plans were developed to buy and ship 150,000 head of brood mares before the end of 1946, but shipping difficulties delayed these shipments to some extent. The total of work animals exported by all agencies was estimated at about 250,000 head. All these animals were branded with U.N.R.R.A. and turned over to the governments for delivery to the farmers. The mares were bred whenever possible before shipment. The demand was strongest for mules and mares, from which more mules could be raised.

Number of Horses and Mules in United States, 1937-46

																					Horses	Mules
1937																				٠.	11,342,000	4,460,000
1938																					10,995,000	4,265,000
1939																					10.629.000	4,163,000
1940																					10,442,000	4.039.000

																					8,841,000	3,408,000
1945	٠	٠		•	٠	٠	•	٠	•	٠	•	٠	•	•	•	•	٠	٠	•	٠		
1946	٠	•	•	•	•	٠	•	•	٠	•	٠	٠	٠	٠	•	•	•	٠	•	•	8,259,000	3,196,000

The number of horses in the world was reduced sharply during World War II by invasion, uncontrolled disease and interrupted breeding operations. The best estimates put the reduction at 20% in Europe as a whole, though U.N.R.R.A. reported that 50% of the work stock was gone in some countries. While the purchases of horses further reduced the number in the United States, the price per head was about the same at the end of Aug. 1946 as a year earlier. (See also Shows [Animal].) (J. C. Ms.)

Horthy de Nagybánya, Nicholas

Horthy (1868—), Hungarian statesman and naval officer, was born June 18, 1868, at Kenderes, Hungary, the scion of an old Hungarian family. He entered the naval academy at Fiume, Italy, at the age of 14, joined the Austro-Hungarian navy and was promoted to high naval positions. He also was aide-de-camp to the Emperor Francis Joseph. During World War I he was in command of a cruiser and conducted daring raids on shipping off the Italian coast. He received the Order of Maria Theresa, highest Habsburg award for personal heroism.

Toward the end of the war he acted with severity in quelling mutinies among the Austro-Hungarian sailors in protest against their rations. His promptness in checking the mutiny led to his appointment as admiral and commander of the entire fleet.

Following the collapse of the dual monarchy in 1918, Horthy was named minister of war in the Szeged cabinet. He organized a counter-revolutionary army and put down the communist insurrection led by Bela Kun. He was named regent of Hungary, March 1, 1920, by the national assembly and the following year he thwarted the attempts of the former emperor, Charles, to resume the Hungarian crown. Thereafter, Horthy devoted his efforts to solidifying his relations with Italy and Germany. In Oct. 1935 Horthy opposed the League's instigation of sanctions against Italy. In return for supporting Hitler in his many prewar campaigns, Horthy was rewarded with Ruthenia,

which was transferred from Czechoslovak to Hungarian sovereignty after the Munich pact in 1938.

Hungary was neutral at the outbreak of World War II but joined the axis pact in 1940. In 1941 the government declared war on the soviet union on the same day that the wehrmacht invaded the U.S.S.R. Horthy's position was weakened by axis reversals in the east in 1942–43, and the approach of the Red army in 1944 led the regent to appeal for an armistice, Oct. 15, 1944. However, the legitimist regime was overthrown by Hungarian nazis and Horthy and his family were taken into custody by the Germans.

Horthy's capture by troops of the U.S. 7th army in northern Tyrol was disclosed May 1, 1945. Upon his subsequent release, the Yugoslav government filed a request that Horthy be turned over to it for trial as a war criminal.

Horticulture

Several distinct horticultural trends appeared in the period 1937-46 in spite of wartime disruptions.

The decline of the large private garden was stimulated under the pressure of excessive taxation and because of a lack of interest in a pseudo-feudal type of living on the part of the younger generation of wealthy families, particularly in England. World War II speeded the process by limiting the labour supply. Once-proud estates were sold cheaply to charitable and educational institutions and public agencies, or were subdivided for the construction of small housing units The result was fewer salaried jobs for trained gardeners and the abolition of one type of training facility for young men.

The declining apprenticeship system of horticultural training was revived in the United States, however, by veterans' on-the-job training. Almost everywhere, horticultural education was established by state institutions with a separation of practical training courses and those dealing with the underlying sciences. Extension services in each community were broadened to include all phases of horticulture. Radio served well in extension work, including the British use of television to teach gardening technique.

Food raised in small home areas prevented serious shortages and maintained reasonable market prices. Expert war gardening advice brought better technique into home gardening operations. The therapeutic side of gardening was discovered by more people working under stress, both in individual plots and in groups, particularly in military hospitals.

In the United States, inland and western cities followed the eastern trend of making the spring flower show dominant among each year's horticultural exhibitions. These major show programs—interrupted everywhere except in Boston—were quickly resumed at the close of the war. In Europe, too, major exhibitions were not held after 1939. Small shows were held during hostilities at times by the British Royal Horticultural society.

At the same time, local shows and, particularly in the United States, specialized exhibitions of individual plants such as the Boston lily exhibition, gained headway during the war years. Local shows in all countries were made an important part of the home food-raising program, especially in Great Britain. In the United States, the local fair emerged from the war years with greater attendance than ever before.

The firmer establishment of competitive exhibitions was a reflection of the increased functioning of general nationwide or regional horticultural societies, which gained strength during hostilities by adapting their programs to the war effort. In addition, improvement of numerous specific plants or types of gardening was fostered by societies such as the organized Dutch bulb growers, the British Alpine Garden society and the American Rose society.

In the United States, special plant societies by registration and adequate preintroduction testing reduced confusion in nomenclature and improved the general quality of named garden plants along lines well established in European countries. The close of the decade 1937–46 brought definite steps toward the founding of a longneeded, over-all organization to co-ordinate the efforts of the thousands of horticultural organizations in the United States.

The public gardens and experiment stations gave more attention to the testing of plant materials, to determine local adaptability as well as relative quality. Although this work lapsed during wartime, interest in the establishment of demonstration gardens and arboretums and the opening of community garden centres was greater than ever. Some institutions of service to horticulture lost herbarium and library facilities during the war, particularly in Berlin and Manila.

With the publication of the New Standardized Plant Names, the international code of botanical nomenclature became standard among horticulturists. Attempts at standardizing the common names of plants were not successful. Horticultural publications were better written than formerly, with general gardening dictionaries predominating. Garden magazines increased in number in the United States and achieved greater circulation.

An era of great plant explorers closed with most of the carth's showy wild plants discovered and introduced into cultivation in climatically suitable areas. With the collector's product as raw material upon which to work, the geneticist began to produce hybrids made to order for particular soil and climatic conditions; for pest resistance; colour, size, form and season of flowers; yield, size, season and nutritive properties of seeds and fruits, and in other ways accentuating horticulturally desirable plant properties. In addition to controlled cross pollination and careful selection, cell changes caused by X-rays and the drug colchicine produced plants not known in the wild.

In temperate regions, the greatest mass application of scientific advance to plant breeding was with corn, both for productivity and disease resistance, also with onions. In both Great Britain and America, culture of the hybrid tomato was begun, but with difficulty because of the need for hand pollination.

Perhaps the most intensive plant breeding programs were those seeking to extend the northern limit of crop ranges, principally by soviet workers, also in the northern plains country of the United States and Canada. Among the ornamental plants, the outstanding new rose was "Peace," of French origin, indicating that European rosarians still led in that field. The famous French rose tests at Bagatelle were resumed after the close of hostilities.

Interest in some favourite plants of long ago was revived. The camellia, with its hundreds of named varieties, again became one of the most sought-after garden plants, particularly in the warmer coastal sections of southern and western United States. Orchids, too, came into their own as commercial cut flowers and as plants for hobbyist gardeners.

Orchids in Europe survived the war years and were among the first blooms to be offered in quantity at the cessation of hostilities. The pelargonium or geranium and the begonias recaptured popular fancy. The chrysanthemum as a garden plant gained steadily in popularity.

Even in the war years, the garden lily staged a comeback

The "Peace" rose, a new variety which created considerable stir among rose fanciers in 1945, and was chosen the All-America Rose selection for 1946

in great variety, particularly in the United States. This trend was fostered by Britain's Royal Horticultural society before the war. The reason for increased activity in lily growing was the advent of many new hybrids and the need for home production of lily bulbs formerly imported from Japan, particularly Easter lilies. Research by the U.S. department of agriculture looking toward home-raised Easter lilies did much to promote the cause of the lily generally. Bulb culture in general made rapid strides in the northwest in the ten-year period.

Demands for food production led to the liquidation of stocks of ornamental plants, especially in Great Britain. Inventories everywhere were evaluated, and many inferior varieties were dropped. In some parts of Europe, particularly Belgium, the Germans protected the equipment and personnel of ornamental horticultural enterprises and distributed the product throughout occupied areas. Failure to propagate during the war years led to postwar shortages of hardy garden plants and the apparent planting of easily-grown, hardy plant materials of lesser garden value, thus repeating the experience of World War I.

The Netherlands bulb industry survived the war and started at once the fight to regain its position in the bulb market, chiefly with tulip bulbs, because its hold on daffodil production was broken by U.S. growers in the years when daffodil bulbs were excluded. French producers reentered the world market with Madonna lily bulbs soon after the war closed. They, like the Dutch, had to meet with competition from newly established growers in the

582 T

United States. Mexico appeared among the suppliers of lilies. A similar industry began growing in Florida, largely because Japanese imports were cut off.

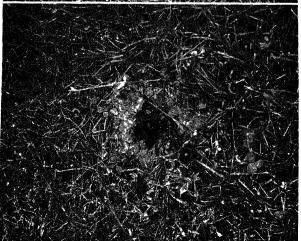

Shipment by air became an important factor in the distribution of flowers, and to some measure, fruits and vegetables. Not only were different growing areas in one country thrown into competition, but producers in all parts of the world became able to ship to common markets. This led to restrictions on the exporting of orchid plants from some of their native areas in South America. Such quick transportation of flowers seemed to lead to a florists' development similar to that created by quick-freezing in the vegetable and fruit industry, wherein production took place in the most naturally favoured location.

In commercial fruit raising, the apple of the northern grower continued to lose out to the citrus fruits of warmer sections. The wider production of a greater range of subtropical fruits attracted interest. By the end of the decade, there were more named varieties of the avocado than of the apple. Advances were made in fruit processing, not alone in freezing, but in new products, such as apple syrup, apple flavours and canned, dehydrated and frozen citrus juices.

The prediction of the exact harvest date by determining the number of days required from full bloom to ripe fruit

Dandelion (top) which has been sprayed with 2,4-D, a plant growth hormone, developed during World War II, which acts as a weed killer when sprayed in large doses. Within three to four weeks the entire root section of the plant is destroyed (below)

was made possible.

The grape profited in the United States through wartime disruption of the European wine industry. New varieties of peaches replaced the older. The cranberry industry was among the most profitable and best managed horticultural ventures in the United States.

Because of suitable growing conditions and because of chaotic conditions elsewhere, much of the seed industry of the world became centred in western United States, this being particularly true of flower seed production in California.

With the cessation of hostilities, the production of seeds, like that of flower bulbs, was resumed in Europe and elsewhere.

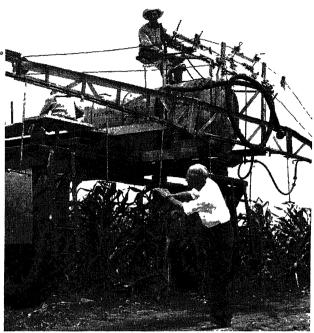

During the war, U.S. seeds were lend-leased to the British, to the U.S.S.R. and other countries, with the result that some U.S. varieties became standard abroad. Likewise, there were other limited exchanges of varieties, such as soviet tomatoes in England and North African squashes in the United States. Also, an oil-bearing, naked-seeded European squash was introduced into America.

When foreign supplies of medicinal, culinary and pesticidal herbs were cut off by war, a U.S. industry for the growing of aromatic plants was envisaged. Higher U.S. production costs worked against the project, however, and except in a few instances of flavouring materials, the market proved not large enough to justify mass production methods. American users of herbs began looking once more to foreign suppliers, with their products of cheap peasant labour. Herb interest caused the reintroduction of the old-time cooking herbs into home gardens. A cottage industry in these plants grew up in some parts of the country.

The results of research in chemistry and plant physiology were adapted upon publication to plant-growing and crop-protection technique. Notable in this trend was the development of varied uses for synthetic plant growth regulating substances or phytohormones. Starting with treatments to stimulate the formation of roots on cuttings and newly transplanted plants, this field was expanded to include the delaying of flowering time of woody plants to escape frost injury, the thinning of fruit crops at blossom time, the prevention of the premature dropping of fruit, the production of fruit in tomatoes and holly without pollination, the retention of leaves on Christmas holly after cutting, the prevention of sprouting in stored potatoes, the hastening of ripening in storage of some fruits, the killing of weed seeds in soil, prevention of ragweed pollen-shedding and other uses involving the artificial control of the behaviour of plant cells.

It was found that the varied actions of the plant growth regulating substances were often accomplished by varying the concentration. An overdose of one called 2,4-D became the basis of a quickly popular weed killer destroying broad-leaved lawn weeds without seriously affecting turf grasses. By combining 2,4-D with other materials, it became possible to weed, feed and protect a lawn against fungi in one operation. This and other plant-killing materials grew out of wartime research into means of destroying crops in axis countries.

Lawn protection was but a single instance of the trend toward safe, cheap and effective destruction of unwanted plants by chemical means. The selective properties of some tested materials, such as the weeding of carrots with a certain dry cleaning fluid, saved labour in cultivation. Even with plant destroyers displaying no selectivity, the fire hazards, soil sterility and poisonous properties of the older herbicides were eliminated in new materials such as

Illinois farmer, using a specially designed tractor, is shown in 1946 about to spray his cornfield with syndeet, an insecticide containing DDT. Developed and tested by the U.S. Rubber Co., the spray proved successful in killing the troublesome corn borer

ammonium sulfamate, 2,4-D and borax when properly applied. These three chemicals furthered the U.S. campaign for poison ivy eradication, started by the Massachusetts Horticultural society.

The development of crop-protective chemicals, both insecticides and fungicides, moved rapidly. DDT, taken over by U.S. chemists from Swiss sources, with which the military controlled typhus, did not prove itself revolutionary in horticultural practice as expected and did not replace other insecticides for crop-protective purposes except in the case of the potato, and for the control of certain pests such as chinch bug, Japanese beetle, rose chafers and codling moth. However, it was found to lend itself particularly well to aeroplane treatment of wooded areas for the control of gypsy moth, or with newly developed fog machines from the ground. Rotenone and the newer sabadilla dust, neither harmful to warm-blooded creatures, held their own. Rotenone production in Peru was stimulated with U.S. aid. Sabadilla provided a long-sought control of the squash bug and the chinch bug.

Among the many new fungicides was fermate, representing a group of synthetic materials which gave promise of rendering the traditional Bordeaux mixture obsolete. The fact that these new materials, many of them specific for certain pests, could be used in combination fostered the trend toward complete pesticides, lethal to all manner of plant enemies. Another trend was the increased application of crop-protective chemicals in the form of dusts rather than as liquid sprays. Soil-borne organisms were fought more widely by soil fumigation with such materials as chloropicrin and by preplanting seed treatment with a variety of fungicidal dusts. Also, the feeding of plants with chemicals, such as a selenium compound in the case of the carnation, to render the plant sap unpalatable to specific pests, reached the practical stage.

The timing and make-up of pest control materials were modified to avoid destruction of pollinating insects. Conservation measures looked to the protection and propagation of beneficial insects. Where pollination of fruit trees was a problem, methods of artificial pollination with liquid or dust pollen preparations were devised. Natural insect and fungus enemies of pests such as the Oriental peach moth and the Japanese beetle were widely introduced into the United States, thus promising relief from hitherto uncontrolled destruction.

A very articulate international group of organic gardeners, following the lead of Sir Albert Howard in England, insisted that proper plant nutrition and soil maintenance would largely eliminate the need for heavy dosing with pesticidal chemicals as a means of crop protection. Research evidence from scattered experiment stations was put forward to substantiate this claim, as in the case of chinch bug attacking nitrogen starved corn.

The rapidly expanding organic gardening movement grew out of remembrance that, years before, excellent crops had been raised with only organic replacements such as barnyard manure. Its protagonists insisted that all chemical soil amendments, except lime, were harmful to both the immediate crop and permanent soil maintenance. The widely accepted conclusion was that both organic means of soil building and mineral replacements with chemicals were necessary; that either method alone was incomplete.

A sharp difference of opinion was created by Edward Faulkner's contention that the plow is the enemy of the soil. The argument focused attention on proper soil handling. One conclusion was that deep soil preparation was not wrong provided the top soil and the organic material were left near the top, and the loosened subsoil enriched with lime and phosphorus—on the bottom. Trash-tarming—enriching soil at the top and deepening it below—was called to favourable attention.

The idea of growing plants without soil by irrigating with carefully balanced nutrient solutions was carried to a high point of development. Starting with the culture of plants so supported that their roots dangled in tanks of aerated nutrient solution, the method was modified later so that the plants were planted in sand, gravel, cinders, vermiculite or some other inert material periodically flushed with the nutrient liquid. This method was widely adopted by the florist industry to produce roses, carnations and even orchids. Its employment for vegetable raising by the military at such places as Ascension Island during World War II received wide publicity. The expense of installation limited the use of the method where it was not necessary. Nutritional deficiencies were determined by chemical analysis of plants as well as soil. Signs of hunger for specific elements as indicated by plant appearance became widely recognized.

Aside from nutrition, plant environment was carefully studied. By controlling day length, it became possible to have chrysanthemums bloom every day of the year. Irrigation equipment was more widely installed to maintain uniform moisture conditions throughout the growing season. By the use of cloches and underground heating cables, British gardeners considerably extended the growing season. American investigators devised means of rooting cuttings and starting seedlings in any building through the use of artificial light and heat. The breaking of dormancy of bulbs and corms for forcing through temperature control and chemical application was reduced to exact processes.

Horticultural equipment became more mechanized even for smaller operations. Small tractors were perfected and equipped with tools for all functions. Lawnmowers, hedge

trimmers and pruning equipment were motorized. New cutting principles for lawnmowers were pioneered. Lightweight metals were used, as in aluminum pruning shears and magnesium wheelbarrows. Plastics found their way into garden hose and hotbed glazing. Only the porous clay flower pot seemed to resist change.

Similar advances were made in larger machinery such as that for tree moving. Large spraying units were revolutionized to permit fast coverage with a minimum of material. (See also BOTANICAL GARDENS; BOTANY; FRUIT; VEGETABLES.)

Hospitals

The hospital, after World War I, changed from a mere last refuge for the sick and a convenience for the doctor to the safest, most comfortable, and most economical place in which to be sick, and a necessity for the doctor who wished to give the best possible care to his patient.

United States.—The decade 1937-46 saw the realization of these facts by the general public, with the result that hospitals were severely taxed to meet the demand for their facilities. The depression years found hospitals financially unable to meet the demands which they had clearly foreseen, and the curtailment of materials during World War II continued to prevent their meeting this shortage. Thus, while the number of beds available in the U.S. nongovernmental general hospitals increased by only 14.8% during 1936-45, the number of patients admitted increased 59.2%, and the average number in hospitals at any one time increased by 37.2%. The discrepancy between the total number of patients admitted and the disproportionally lower average number of patients in hospital at any one time was largely explained by the fact that, while the average patient remained in the hospital 12.47 days in 1936, the average stay was reduced to 10.8 days in 1945. This shorter stay reflected not only better care rendered the patient as a result of advancements in medical science but the fact that, with the public's greater acceptance of the hospital, patients were inclined to enter the hospital earlier in the course of their disease. This earlier active treatment shortened the period of illness, decreased total period of disability and the hazard of permanent disability, decreased the mortality rate, and reduced the financial cost to the patient.

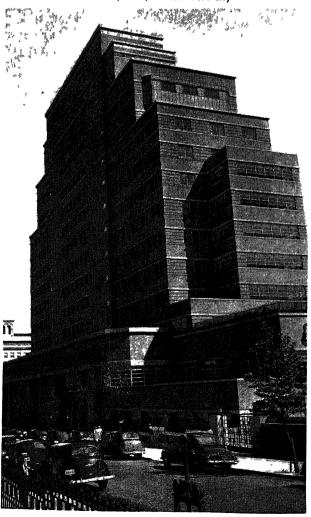

Approximately one-third of all U.S. hospital beds for the treatment of acute disease in 1946 were in tax-supported institutions, varying from large state university hospitals to the familiar city or county charity hospital. As a reflection of changing economic conditions, the average number of patients in tax-supported hospitals increased by 10% during the period 1936-40 and then decreased 16.6% during the period 1941-45, or an over-all decrease of 8.2% for the ten-year period. Again, there was

a sharp decline in the average days' stay per patient from 54.7 days in 1936 to 26.3 days in 1945, probably explain able by the same reasons as given in the case of nongovernmental hospitals. The marked shift from nongovernmental to tax-supported hospitals beginning about 1941 could be attributed in part to the improved economic conditions following the outbreak of World War II.

A very great factor, and one which promised to continue, was the development of Blue Cross and other hospitalization plans. On Jan. 1, 1936, there were only 214,000 persons in the United States protected by Blue Cross hospital insurance. By Jan. 1, 1941, this figure had increased to 6,149,000; and, by Dec. 31, 1945, to 20,000,000. With more than 20,000,000 people (probably 25,000,000 if plans other than the Blue Cross were included) covered by sickness insurance, the shift from tax-supported to voluntary hospitals was understandable and promised to be a potent and permanent element in financing the cost of hospital care.

Rising costs of hospital operation in 1946 were causing much concern as to how the hospital could render adequate service at a price that the patient could afford to pay. A nation-wide survey revealed an increase of 54.3% in actual current costs of operation during the period from 1940 to 1945. These increases were due not only to wage and commodity cost increases but to shorter working hours as well. The hospital had to continue operating

Memorial hospital, world's largest cancer institute, was opened June 14, 1939, in New York city

and caring for its patients 24 hours a day and 7 days

At the beginning of the decade, the vast majority of patients either paid their own hospital bills or had them paid by charitable endowments, community chests or local tax funds. At the end of the decade, the trend was all in another direction. Blue Cross already protected more than one-seventh of the population, and Workmen's Compensation and similar liability insurance paid a large proportion. During World War II, the federal government, through its Emergency Maternity and Infant Care (E.M. I.C.) program, assumed responsibility for the payment for hospitalization of the wives and minor children of men in the armed services. After the war, the Veterans' administration, which forecast a need of 300,000 beds for the care of veterans, initiated a program which was expected to permit a reduction of beds in veterans' hospitals by about 150,000, by caring for the other 150,000 veterans with service-connected disabilities in civilian hospitals and by doctors located in the veterans' own home communities. In some communities, 60% of all payments in 1946 were made from such nonpatient sources: Blue Cross, commercial insurance of various types or tax funds. Some informed observers predicted that such payment from sources other than direct payment by the patient himself would soon reach 75% of the hospital's total income.

This shift in sources of payment was accompanied by peculiar problems. Blue Cross rates to subscribers were established during a lower-cost period and, while actuarily sound at the time of their establishment, were in many cases inadequate, by 1946, to permit the company to meet the rapidly increasing costs to hospitals. Commercial insurance companies and tax-spending agencies had traditionally driven hard bargains with hospitals, demanding minimum rates for payment-often far below the cost of care. At least 75% of the cost of operating a hospital had been a continuing cost, more or less irrespective of the number of patients being cared for. Hospitals had often accepted these reduced rates on the theory that such patients added to the income more than they added to the cost of operation. It had been a tradition in all medical service that charges should be graduated according to the ability of the patient to pay, rather than according to the immediate cost of the service rendered. Hospitals quite generally adopted this medical tradition and charged rates higher than cost to private and de luxe patients to compensate for the losses on those unable to pay cost. This was justified as a method of ensuring care to those unable to pay for it. The hospital was operated on a notfor-profit basis. All it could hope for was to remain solvent, and this seemed the most practical method of attaining its goal of serving rich and poor alike, according to their hospital need, irrespective of their ability to pay.

By this shift of sources of payment to corporations, both profit and nonprofit, and to tax-spending agencies which had to justify every payment made, meant that the number of patients who could pay more than cost was very much reduced, and the "enforced philanthropy" principle was no longer adequate. Formerly, in the era of large private fortunes, hospitals were the recipients of somewhat generous endowments and other gifts from which to pay for such service as was rendered at less-than-cost rates. But later tax practices tended to destroy large private incomes and to convince the large income-tax payer that he had already contributed his share to the public welfare and that large voluntary contributions to philanthropic causes were no longer an obligation.

Thus with philanthropic income, whether voluntary or enforced, drying up, it became necessary for hospitals to face economic facts. The theory that a "half a loaf is better than none" no longer applied. Service to the patient was becoming a commodity, each unit of which had to be paid for on its own merits if the hospital was not to face insolvency and closed doors.

A bright spot in the picture was that the U.S. children's bureau, charged during World War II with the administration of the E.M.I.C. program, accepted the principle of paying each hospital an amount equivalent to its own current cost of operation plus 10% to cover depreciation on plant and equipment. This principle was justified by the fact that the better service the hospital gave, the more it cost. The Veterans' administration in 1946 was contemplating a similar formula for patients sent to civilian hospitals. With these strong precedents, it was hoped that other contractual agencies in the hospital field could be induced to make full payment of costs for service rendered their beneficiaries. Only when this was done could the hospital be assured sufficient income to permit it to continue giving adequate service. In general, any single, fixed, flat-rate system of payment tended to benefit the hospital giving poor service and to penalize the hospital giving adequate care to its patients.

As a part of the nation-wide business census of 1935, the U.S. public health service conducted the most exhaustive survey of hospitalization ever attempted to that time. Part of the findings of this survey indicated that availability of hospital facilities was more a matter of maldistribution of facilities than of over-all shortage. High income and densely populated areas were relatively well supplied while low income and thinly populated areas were not only poorly supplied but did not use such facilities as were available to the same extent that the better provided areas did. This study eventuated in a plan for a series of hospitals consisting of small medical centres having a few beds for emergency purposes, district hospitals to serve larger areas, regional hospitals to which the more difficult cases could be referred by district hospitals and, finally, large medical centres to which the more rare and complicated cases could be referred for highly specialized procedures beyond the facilities of the regional hospitals.

Another result of this survey was the introduction of federal legislation to provide federal funds to states to assist them in meeting the shortage of facilities within their own states in case of demonstrated need; i.e., both need for additional facilities and demonstrated need for financial assistance in providing them. The Hospital Construction act passed by the U.S. congress in 1946 authorized federal grants to states on a matching basis for the making of surveys to determine the number and location of additional hospital beds needed, and to make grants of funds to states on a one to two matching basis for such hospital construction as adequate surveys had shown to be needed. Once granted, such funds were to be administered by an agency of the state created for that purpose.

In 1943, the American Hospital association, contemplating the need for orderly expansion of hospital facilities within the United States, secured funds from three of the large philanthropic foundations and sponsored the appointment of a representative commission to make a nation-wide survey of hospital facilities. This commission conducted a pilot survey of the state of Michigan and began assisting all other states which desired to conduct similar surveys of their facilities. These surveys included

exhaustive factual data concerning every institution which rendered any type of hospital care within the state. By mid-1946, 11 states had completed the collection of data, 28 were in process of doing so, and the remainder were definitely preparing to conduct surveys.

Great Britain.—It was clear at the outset of World War II that all British hospitals would need to be organized as a single service if large numbers of casualties were to be handled efficiently at short notice. The minister of health, therefore, assumed responsibility for establishing an emergency hospital service, a detailed account of which was given in the summary annual reports issued by the ministry of health, especially those for the years 1942, 1943 and 1945. The organization of the service was entrusted to medical men, matrons and administrators designated by the minister of health, but the administration of the hospitals remained in the hands of the voluntary hospitals, or of the local authorities respectively. By Sept. 1939 arrangements had been improvised and a large number of beds made available for the receipt of casualties. In the great cities many thousands of patients were evacuated to safer areas. The absence of serious air raids during the first year of World War II afforded a breathing space, and

Wesley Memorial hospital, at Chicago, III., completed in 1941 with accommodations for 525 beds and staffed by the medical school of Northwestern university

when the test came with the casualties from Dunkirk and the air raids of the battle of Britain in 1940, the organization functioned with success. The hospitals suffered severely from bombing; in London, St. Thomas's hospital, Guy's hospital, the Royal Free hospital and the London hospital were among many severely damaged. In almost every heavy raid the hospitals were hit, but the loss of life both among patients and staff was much less than might have been expected.

These wartime experiences served to throw into relief the deficiencies of the existing dual hospital system with its many autonomous units of varying size and efficiency, and to emphasize the value of the national framework provided by the emergency hospital service.

A White Paper issued in 1944 had proposed a comprehensive hospital service which should be free to all irrespective of ability to pay. It envisaged a system of partnership between the voluntary hospitals and those of the local authorities.

Under the National Health Service act of 1946, all hospitals in England and Wales, including such well-known institutions as St. Bartholomew's, St. Thomas's, Guy's and the London, as well as the hospitals administered since 1930 by the county councils, passed into the ownership of the minister of health. The act did not extend to Scotland, but it was expected that legislation on similar lines would follow at an early date. It was provided that the minister should delegate his responsibility to regional boards, and the day-to-day management of the hospitals was entrusted to local management committees. A great deal of freedom was conferred on the teaching hospitals. Provision was made for income from the endowments of the voluntary hospitals (estimated at about £200,000,000) to be used by the regional boards and the respective committees as "free" money over and above the provision made by the minister for ordinary expenses. The hospital management committees were empowered to receive gifts from the public, and from trusts.

British Commonwealth.—In the dominions also the decade was marked by a series of attempts to plan complete hospital systems. In New Zealand, where a system of hospital boards was already in operation, the Social Security act of 1938 provided for free care to all using public hospitals, and for an equal scale of payments to those using private hospitals. In Australia and South Africa rapid progress was being made toward the establishment of a comprehensive service. In Canada, with its more highly developed voluntary system, there was evidence of hesitation on the question of public control, but in 1945 the dominion government tabled proposals for loans to the provincial governments for hospital expansion, and further developments were being awaited with interest.

Europe.—Normal development in European hospital work was hampered or totally paralyzed in belligerent or occupied countries during World War II. A great number of temporary war hospitals were erected, but most of them would have little influence on future hospital shaping. Few large building enterprises were begun during 1937-46 in countries that had previously made important contributions in the domain of hospital work, such as Germany, the Netherlands, Belgium, Denmark, Norway and Finland. During the last phase of the war, and as soon as hostilities ended in May 1945, the authorities in several countries responsible for hospital development

Hospital Beaujon, accommodating 1,100 in-patients, was built in suburban Clichy, outside of Paris, prior to the outbreak of World War II

were anxious to bring about an international exchange of experience. In 1946, especially in the northern countries, planning had begun and measures were taken for recovery.

France.—In 1944 the prominent French hospital constructor, Jean Walter, and his colleagues brought out a survey of the development of French hospital work. Just before the outbreak of World War II the hospital Beaujon outside Paris (1,100 in-patients) was completed. In 1946 a hospital was being built at Lille. Elsewhere also building was in progress, although on a smaller scale. In Angora, Turkey, a hospital was constructed by Walter.

Switzerland.—At Zurich a large university hospital (1,500 in-patients) was partly completed in 1946. The hospital was designed by a staff of co-operating architects, physicians and others led by Dr. H. Fietz. During World War II the interesting hospital Bürgerspital at Basel (600 in-patients) was completed. In several other places in Switzerland plans for reconstruction or for new hospitals were being sketched out, as at Wintherthur (700 in-patients).

Sweden.—Shortly before World War II the main part of a new university hospital in Stockholm, Karolinska hospital (1,059 in-patients) was completed. During the war the city of Stockholm erected the Soder hospital for 1,200 in-patients, which was to be in full service in 1947. It was constructed as a diagnosis centre and constituted a link of an extensive medical and general social plan, comprising many institutions. In Gothenburg, Lund, the county of Stockholm and other places extensive hospital building was planned. (C. H. Cm.)

Hotels

The decade ending in 1946 witnessed profound changes in the hotel industry of the United States. The long period of depression ended, the beginning of com-

parative prosperity appeared. Room occupancy in large cities reached the unheard of figure of 95%, from a low of 50% in the middle '30s. Restaurants and bars turned away patrons; night clubs again became profitable; banquets and private function business reached new high levels.

The hotel investment field, long regarded with disfavour by investment counsel, presented new opportunities, with fixed charges sharply reduced by reorganization. Shrewd capitalists purchased famous hotels just emerging from financial difficulty at bargain prices. Chain operation of hotels expanded greatly. The \$26,000,000 Stevens hotel in Chicago, Ill., was first bid in for \$5,250,000, and later resold to Conrad Hilton and his associates for \$7,500,000. The Palmer House, Chicago, was purchased later by the same interests at less than ½ its cost of construction. In New York city, the luxurious Hotel Pierre, which cost approximately \$12,000,000, was sold for \$2,500,000. The smart Ritz Carlton, built and furnished at an expense of more than \$3,000,000 brought less than \$700,000 in a resale.

During the 10 years, almost all hotel labour was organized into unions, chiefly controlled by the American Federation of Labor. The ratio of pay rolls to receipts rose from about 25% in 1936 to nearly 40% in 1946. The great gain in bar and restaurant business which began in 1940 brought about a corresponding increase in tipping, and the disparity of compensation between tip and nontip employees became a serious problem to labour and management.

In 1946, the prosperity of large U.S. hotels was, therefore, still relative, in spite of high occupancies and peak business in bars, restaurants and other departments. Room rate and price control exercised reverse leverage upon hotel earnings, since sharply increased operating costs could not be offset by expansion of sales, limited in hotels by the capacity of the structure.

The easy tradition of hotel operation, inherited from England and the continent, possible only with low wage scales, was replaced by ruthlessly efficient control of all expenditures and elimination of all wasteful practices.

The manager portrayed by Ludwig Bemelmans in *Hotel Splendide*, serenely unaware of what transpired in his hotel, had disappeared. The ratio of three employees to each guest described by Arnold Bennett in *Imperial Hotel* as necessary for perfect service in a famed English institution no longer existed, even in England.

The depression in the U.S. hotel industry which began before the slump in 1929 intensified until the beginning of World War II. By 1937, 82% of the nation's hotels had defaulted on their obligations; nearly \$5,000,000,000 in securities declined to a mere fraction of their issue price. This was the disastrous outcome of overbuilding, and reckless financing, resulting in rate slashing and inexpert management that were the inevitable result of the nationwide overexpansion of hotel facilities. It was free enterprise at its worst.

Banks, insurance companies and mortgage houses of issue found themselves involved in the control of large hotels without experienced personnel to take over their direction. From this, a new type of hotel management emerged, in which national firms of hotel accountants played an increasingly important part. Cost ratios determined menu selection, and the gracious precepts of Ritz and of Escoffier began to be replaced by more scientific practices.

This was not, in every case, a loss to the amenities involved in hotel and restaurant operation. More realism was employed. Menus were written in English instead of French, and dishes which indicated the preference of the diner rather than the chef became customary in the à la carte offerings of even the most noted hostelries.

As a result, the number of connoisseurs declined. Expected demand, after prohibition repeal, for the great estate bottled Bordeaux and Burgundy wines, the magnificent products of the Rhine and Moselle vineyards, did not materialize. The rigid convention of the sequence of wines to be served with each course of a long and elaborate dinner was discarded.

With it went the dignified, sometimes pompous atmosphere of the old world hotel. During World War II, men in uniform predominated in place of the customer who travelled for business or for pleasure. Evening dress was no longer seen and in the prestige rooms of the great hotels swing bands became popular instead of the modulated volume and tempo of what were called society orchestras.

Something called showmanship became a factor in business promotion. A restaurant in a Chicago hotel achieved national attention in a season by serving most of its dishes on flaming swords, by waiters in red coats and knee breeches.

. The cycle of change in architectural design of huge skyscraper hotels also moved toward greater simplicity. The Georgian inspiration vanished, and to replace it came modern, almost functional lines, with an occasional exception of the baroque style affected by Dorothy Draper.

Only one or two large hotels were erected in the United States during the ten year period 1937-46. At the 1946 completion cost of \$18,000-\$20,000 a room (land, furniture, equipment and building) for such giant edifices as the Waldorf Astoria in New York city and the Palmer House in Chicago, the investment had become economically unsound and unjustifiable.

There was, of course, a great deal of remodelling of old hotel buildings. Since almost all U.S. hotels had been built before 1931, extensive alterations of bedrooms and public rooms were necessary, and as much of this was accomplished as was possible under wartime regulations. Substantial deterioration in furniture, equipment and structure of hotels still remained. At the end of 1946, U.S. hotels stood in need of repairs, re-equipment, alteration and reconditioning which would require expenditure of nearly \$1,000,000,000. This sum would be spent with a much more thorough knowledge of economical and efficient layout and arrangement of equipment and facilities. Labour-saving devices were considered on a scale hitherto uncontemplated by an industry previously committed by precedent to inefficient methods. (E. By.)

Hotels in Other Countries.—In the two years prior to the outbreak of World War II in 1939, the hotel industry in most countries suffered the repercussions of political events. The large cosmopolitan establishments, relying to a substantial extent upon clients from countries other than their own, were particularly affected by the constant political tension. However, differences in size, character and clientele were such that certain classes of establishments could do satisfactory business, while others, even in the same country, found the going hard. Generally speaking, however, the political events in every country of the world during the years 1937–39 affected hotel takings sufficiently to cause most managements anxiety.

Internationally, the hotel industry before 1939 was organized into two associations, the International Hotel alliance, grouping the national hotel associations of some 20 countries, and the International Hotelmen's association, composed of hotel owners and managers. In March 1946, at an international meeting held in London, England, these two bodies were merged into a new International Hotel association with Sir Francis Towle (Great Britain) as president.

În 1946 the new association had still to face some problems that had already come before the old alliance in prewar days. Tipping was one of them. During the preceding years the continental system of substituting a service charge for tipping made further progress although not infrequently managements decided to leave clients the choice between either. The abolition of tipping by law attempted under some dictatorial regimes had little success. But neither did the percentage charge system remove tipping. The problem of travel formalities, visa fees, currency regulations, internationally important already in 1939, had by 1946 gained in acuity. As formerly the old alliance had, the new association brought concerted action to bear on this problem.

It was similarly concerned with the publication of international hotel guides, uniformity of hotel rates, relationship with travel agencies, etc.

After the outbreak of World War II, the governments of belligerent countries were quick to use hotels for war purposes. Hotels were requisitioned for use as wartime offices for government departments and fighting services, for the billeting of personnel, as food and instructional centres and for other wartime activities. In Great Britain the government passed the Compensation (Defense) act, 1939, giving itself full power to take over hotels and other property, and providing for the payment of a compensation rental. Several hundred hotels were immediately commandeered in this way on the declaration of war to facilitate the dispersion of ministerial and departmental staff in anticipation of bombing. Requisitioning steadily increased until more than 4,000 British hotels had been commandeered. By Oct. 1, 1946, this number had been reduced to 558. Later in the war the government also requisitioned hotel furniture and equipment. In the defense areas on and around the south and southeast coast and elsewhere, most hotels were forced to close through lack of business, securing only a small measure of compensation through relief of tax and other debts, etc. Hotel business in "target areas," such as the large towns and cities, fluctuated with the varying threat of bombing. Outside these areas, with the growing shortage of accommodation, it prospered, despite the very great difficulties which faced managements on account of controls and shortages of every kind. Of the extensive wartime legislation, a high percentage directly affected hotels and restaurants. Statutory rules and orders covered every aspect of the hotel business, e.g., food rationing, fuel, clothing, equipment, prices, buying permits and supplies. The labour problem also proved exceptionally difficult, as large numbers of trained and experienced employees were called

In 1943 the minister of labour and national service, Ernest Bevin, introduced in the British parliament the Catering Wages act. It established machinery to deal with wages and conditions of employment in hotels and restaurants and all forms of catering establishments. The findings of wages boards were expected to determine future working conditions in the industry.

When World War II ended, rehabilitation of hotels be-

came the urgent problem of the industry in all countries. In this respect Switzerland, in particular, was fortunate. Its hotels had not been affected by the war to anything like the same extent as elsewhere. Certain Scandinavian countries were also more favourably situated than, for instance, Great Britain, France, Germany, Belgium and the Netherlands, where many establishments had been destroyed or had suffered bomb damage. But rehabilitation necessarily required adequate labour, equipment and supplies of soft goods, curtains, linen and bedding, cutlery, glass and other articles, for which the supply position in 1946 was still very difficult. Most countries and Britain in particular were faced with a housing shortage. Housing schemes claimed practically the whole of the labour, materials and equipment available. The need for greater exports also reduced the supply of goods in the home market. Thus, rehabilitation work was delayed and could not be expected to make any real progress until the priority claims of housing had been satisfied.

On the French riviera, in Belgium and the Netherlands great progress toward rehabilitation of hotels was reported at the end of 1946.

By 1946 most governments had discovered in "tourism" a valuable source of foreign exchange. But to attract visitors from abroad required adequate hotel accommodation. In Great Britain, the government in 1946 set up a new department under a special board which was responsible for the tourist industry, home holidays, the hotel and catering services. During the last years of World War II hotels were bought and sold extensively at greatly increased prices.

Housing

During the ten-year period, 1937-46, there was increasing emphasis upon the construction of homes for lower income groups in the United States. In the earlier part of the decade that emphasis was occasioned by realization of social requirements. In 1941, when national attention was turned to the erection of war production plants and military camps, home-building attention was focused upon inexpensive construction for war workers and military personnel. When World War II ended, home construction was geared toward the returning veterans, three-fifths of whom according to surveys could not afford to pay more than \$40 a month for housing.

With the realization of the special need for low-cost housing, efforts were made to decrease the costs through economies in traditional building procedures and through prefabricating methods. During the early part of the decade some slight progress was made in this direction. Many lower-cost homes were built with private funds through Federal Housing administration (FHA) stimulation.

At the very beginning of the decade (1937) congress enacted the Wagner-Steagall act, which set forth a new governmental principle—that government would make loans and grants to provide housing for families of low income who lived in substandard dwellings and could not afford rents which privately financed units must ask. Prior to the inception of the war-housing program in 1941, \$800,000,000 was authorized by congress for loans to local housing authorities for the construction of sound homes with

light, air and sanitary facilities for low income families as an equivalent number of substandard homes were demolished. Congress also authorized grants which were used to pay for the difference between the actual cost of the units and the price at which they were rented. The aggregate amount of grants contracted for could not exceed \$28,000,000 per year. Actually, the amount paid in any one year through the decade, 1937-46, never amounted to as much as half of this maximum. Both the capital funds and annual contributions provided for the U.S. Housing authority were made available by congress in June 1940 for use in providing homes for workers in defense industries. The subsidies and local tax exemption were necessary because it was impossible to reduce building costs sufficiently to bring the rental within the reach of low-income families. The reduction of interest rates and of builders' profits did not cut enough cost. Under the entire program 172,728 units were built in 262 localities. Contracts outstanding with local authorities covered 20,516 units which were deferred during World War II because of the shortage of building materials. The contracts covering the active and deferred projects exhausted the financial authorizations available to the Federal Public Housing authority for low-rent housing.

Between Jan. 1, 1937, and Dec. 1941, FHA, under title I, insured mortgages secured by 35,359 new single-family homes valued by FHA between \$8,000 and \$10,000; 167,497 new single-family homes with FHA valuations between \$6,000 and \$8,000; 354,242 new single-family homes valued between \$4,000 and \$6,000; and 178,110 new single-family homes valued at less than \$4,000. (Of the 33,468 title I loans insured from 1938 through 1941, 33,234 were for new homes valued at less than \$4,000 and 234 were for homes valued at from \$4,000 to \$6,000.)

Under the rental housing program of title II (the war housing rental program under sec. 608 was not in operation until 1942) the FHA insured, between Jan. 1, 1937, and Dec. 1941, 340 mortgages comprising 35,715 family units. These were distributed in monthly rental groups as follows: 1,750 with rentals of less than \$35; 12,393 with rentals of \$35 to \$50; 10,322 with rentals of \$50 to \$60; 8,643 with rentals of \$60 to \$75 and 2,607 with rentals of \$75 or more. (Gross rental included, in almost every case, heat and janitor service and in many cases utilities.)

It was estimated that 719,000 private nonfarm family units costing less than \$10,000 were built with uninsured financing in the years 1939-41.

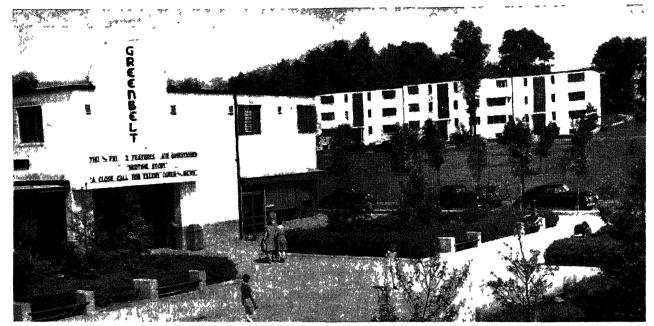

Table I shows the volume of homes constructed in the first nine years of the decade and their total cost:

Shopping centre and motion picture theatre integrated with the architecture of the federal housing project at Greenbelt, Md.

It was interesting to note that FHA began its operations in a period of financial stress and continued in years of increasing prosperity. Therefore, in nearly 12 years of experience only 4,083 of 1,144,440 home and housing project mortgages insured by FHA, for building and buying homes under title II, were acquired by FHA from lending institutions in exchange for government-guaranteed debentures. On March 31, 1946, FHA had sold with very little loss all of these 4,066 individual homes and 17 large-scale projects which it had taken over.

The lower cost homes built between 1937 and 1941 did not necessarily reflect building-cost economies. They frequently represented a cut in the size and quality of the house. The reduction in cost was often obtained through omission of garages, porches, cellars, fittings or attic room finishing and through drastic reduction in room sizes.

This practice was continued in the latter half of the decade, when all home building was restricted to lower cost housing for war workers, military personnel and veterans. During World War II critical material was allocated to housing through priorities issued to builders in overcrowded military and production areas. Builders were restricted in price, size of home and number of units.

In Sept. 1941, when the priorities system was instituted, the cost limitation was \$6,000. It was raised in Nov. 1944 to \$8,000 for that portion of the war housing program known as H-2 (housing to relieve situations of extreme general hardship). The \$6,000 ceiling remained in effect throughout World War II for the H-1 portion of the program (housing for in-migrant war workers). Housing to relieve individual hardship and to take care of returning veterans, known as H-3 housing, had no ceiling. There were 924,801 permanent units started with priority assistance by private enterprise (832,529 H-1 units; 30,672 H-2 units and 61,600 H-3 units) and 276,447 by public financing between July 1, 1940, and Sept. 30, 1945.

To stimulate privately financed building during World War II congress enacted the National Housing act's title VI, guaranteeing 90% mortgages on home loans and authorizing a limit of \$1,800,000,000 for insurance. FHA insured loans on approximately 450,000 new dwelling units under its provision. On March 31, 1946, 5,416 prop-

erties had been acquired by the FHA from the lending institutions after foreclosure, of which 1,944 had been sold with an estimated charge of \$537,595 against the War Housing Insurance fund. The balance of 3,472 remained with FHA.

When war-housing production began, there were 16 agencies in the federal government dealing with housing. They tangled and wrangled in the scramble for production. Chaos was rampant. In an effort at improvement Pres. Franklin D. Roosevelt issued an executive order on Feb. 24, 1942, establishing the National Housing agency (NHA) consolidating the nonfarm housing functions of the federal government in a single agency (See below).

Rocketing Prices.-The rising cost of homes did not deter home-buying. People had money and wanted to buy. But many who did not want to buy were forced to buy because of the housing shortage. In Nov. 1945 there was only a 1% vacancy in dwelling units on the sale or rental market in urban areas and 2% or 803,000 units for the country. Construction of new homes had been curtailed by war restrictions, so a large proportion of purchases were of old homes withdrawn from the rental market. A substantial number of purchases were forced. Competitive bidding by prospective owners caused sharp price rises. According to surveys of the bureau of labour statistics, between April 1940 and Oct. 1944 the proportion of urban residential housing occupied by owners rose from 41% to 47%, an increase of 15%. In 122 congested cities there was a median increase of 28%, with one-fourth of the cities having increases of more than 36%. The supply of single-family rental dwellings was reduced by as much as one-third in less than a two-year period in some large cities.

Table II.—Average Percentage Increases in Prices of Homes and Home Sites Spring 1940 to Feb. 1946

	Homes	Home Sites	tes
	Under \$6,000 \$6,000-\$12,000	Raw Land Lot	ts
All cities	65.1 57.0 66.0 61.7 64.9 55.9	60.1 61. 68.7 64. 57.9 61.	8

The sharp increase in sales price, combined with forced purchases of homes by persons not in a financial position to assume the cost of home ownership or by persons whose residence in a community might be only temporary, created a costly, unstable and insecure type of home ownership for many families.

Mortgages and HOLC.-Mortgage foreclosure during the decade, 1937-46, was not the acute problem that it had been in the depression years immediately preceding the decade. Between June 1933 and 1936, the Home Owners' Loan corporation had refinanced the loans on homes of more than 1,000,000 distressed U.S. families, mortgages which were in arrears on the average nearly 2 years. They were given a new chance to save their properties through low-interest loans, payable over a period of 15 years. By taking more than \$3,000,000,000 in defaulted mortgages, the HOLC had helped stabilize the home-mortgage market and checked the downward spiral of property values. In exchange for frozen mortgages, the corporation had disbursed nearly \$1,000,000,000 to banks and trust companies and hundreds of millions to savings and loan associations, finance and mortgage companies, insurance companies and individual mortgage holders.

At the end of 1945 the corporation was more than three-fourths liquidated with its \$3,500,000,000 total investment now down to \$853,951,000.

Condition of Homes.—According to reports of the bureau of the census, some improvement was shown between 1940 and 1945 in the average condition and facilities of homes in the United States. Occupied dwelling units increased about 2,750,000 in this period. The estimated number of occupied dwelling units in Nov. 1945 was 37,600,000. The trend to the cities was emphasized by an increase in more than 3,000,000 urban occupied units and a decrease of nearly 800,000 rural-farm occupied units. Rural nonfarm units increased by only about 400,000.

In this period the physical condition of homes in the United States improved. In 1945, 33,258,000 or 89% of the occupied dwelling units were not in need of major repairs, with 92%, 87% and 78% for urban, rural-nonfarm and rural-farm respectively. Corresponding percentages in 1940 showed that 82% of the occupied units were not in need of major repairs, with 89%, 78% and 67% for the urban, rural-nonfarm and rural-farm areas.

In 1945, 23,438,000, or 71%, of the 33,258,000 dwelling units needing no major repairs contained both a private bath and a private flush toilet. Of all urban occupied dwelling units, 78% contained both private bath and private flush toilet and needed no major repairs, while 52% of the rural-non-farm dwellings and 15% of the rural-farm dwellings were reported in this class.

Almost 1,000,000 of the 4,342,000 units needing repairs contained both a private bath and a private flush toilet. In this group were 3% of all urban units, 2% of the rural-nonfarm units and 1% of the rural-farm units.

Of the 37,600,000 occupied dwelling units in 1945 more than 24,500,000, or 65%, had a private bath or shower in the structure for the exclusive use of the occupants of the dwelling unit. The corresponding figure for 1940 was less than 20,000,000, or 57%. A private flush toilet in the structure was reported for 69% of the occupied dwelling units in the United States in 1945, as compared with 60% in 1940.

Although there were fewer rural-farm occupied dwelling units in 1945 than in 1940, 1,000,000 more of these rural-farm homes had electric lighting.

A sizable proportion of families remained in poor, illconditioned, overcrowded, unsanitary homes. As World War II neared its end, peacetime social objectives again

came to the fore, and consideration was given to means of clearing urban and rural slums and rehousing the illhoused. The Wagner-Ellender-Taft bill, cited as the "General Housing Act of 1945," was introduced in congress on Oct. 29, 1945. It passed the senate, but died in committee in the house. The bill was based upon the assumption that private enterprise would need assistance to enable it to build for that portion of the middle-income market not previously served and to rebuild outworn sections of cities; and that public funds would be necessary to subsidize the construction of homes for low-income families. The bill was an inclusive housing measure providing for (1) the establishment of a permanent National Housing agency (since the existing NHA had been established under the President's War Powers act and would cease to exist six months after the duration); (2) the use of federal funds in research, market analysis and local planning; (3) amendments to existing aids to privately financed housing; (4) new aids to privately financed housing for families of lower income (these included supplemental mortgage insurance for home owners of lower income and provisions for insurance for mutual ownership and rental housing); (5) insurance for investment (yield insurance) for rental housing for families of moderate income; (6) provision for loans and grants to enable private enterprise to redevelop slum and blighted urban areas; (7) aid to localities for low-rent housing (a continuation of the Wagner-Steagall act program); (8) aids to housing on farms and on rural areas; (9) provisions for disposition of permanent war housing and other federally owned housing with preference to servicemen and veterans and (10) provision for periodic inventory of housing needs and programs.

The bill's failure was a keen disappointment to those who were concerned with the provision of homes for families in income levels not adequately served before World War II, and with the elimination of ugly and costly slum areas. The provision for a permanent NHA and a continuation of the public housing program raised strenuous opposition from the National Association of Real Estate Boards, the National Association of Home Builders, the chamber of commerce and the Producers council. A separate attempt to create a permanent National Housing agency through the president's authority to reorganize executive departments was rejected by both houses.

(D. RN.)

NHA and the Vet Problem.—The various government agencies which had been established to combat the depression and stimulate home building were brought into the National Housing agency, established by executive order of the president in Feb. 1942. Operations were streamlined through three major units—the Federal Housing administration, the Federal Home Loan Bank administration and the Federal Public Housing authority. Strict controls had to be placed on materials used for housing, because the same materials were needed for direct production of weapons for war, and housing was limited almost entirely to meeting the needs of migrating war workers.

This move caused hardships on the housing industry; it meant restrictions and regulations in what always had been a free market. It meant denying the privilege of building a home to many who, with war incomes, were able to pay for one for the first time in their lives. It forced suspension of the low-rent slum clearance program. And yet not enough materials could be supplied to give even all war workers good homes. Nevertheless, the program took care

of 4,000,000 war workers who migrated from all parts of the country to take jobs on production lines. Housing programs were carried out in 1,200 communities. In all, more than 1,900,000 quarters for war workers and their families were provided through new construction and conversion after July 1940. When the war housing job ended, more than 1,000,000 units had been provided by private financing at an investment of approximately \$5,600,000,000, much of it protected by FHA insurance. Public financing had supplied more than 840,000 units at a cost of \$2,300,000,000.

Through this war housing program, a core of the building industry was kept active in meeting imperative demands and in preparation for the postwar job. On Oct. 15, 1945-two months after the end of World War II-War Production board order L-41, the war measure which restricted nonresidential construction and limited residential building to quotas established by the National Housing agency was lifted, and sales price ceilings and priorities for materials were abolished. The result was a boom in nonresidential construction, chiefly at the expense of home building. War-curtailed building materials producers and distributors were not yet ready to meet the tremendous demand. Many home builders found themselves unable to compete for scarce materials against commercial and industrial builders. Residential construction declined accordingly.

Meanwhile, the long-standing housing shortage in the United States became a housing emergency. As of Oct. 1, 1945, 1,200,000 families were living doubled up with other families. The number of men leaving the armed forces in one month exceeded the largest number of houses the United States had ever built in one year. Vacancy rates in most cities and towns had dropped to alltime lows. It was estimated that something near 3,000,000 new dwelling units would be needed by the end of 1947 only to keep the shortage from getting worse.

On Dec. 31, 1945, title V of the Lanham act was amended to provide \$191,900,000 to aid in providing reuse war housing to communities and educational institutions for veterans' accommodations. (Another \$253,727,000 was appropriated under the same act on April 9.)

With the plight of homebuilders steadily growing worse the government began to restore controls over housing at the turn of 1946. The Civilian Production administration issued priority regulation 33 on Jan. 15; this established a priority system (to be known as "HH priorities") covering 11 critical materials applicable to the construction of veterans' housing costing \$10,000 or less or renting for \$80 or less a month per unit. Subsequent amendments raised the number of building materials under HH priority ratings to include almost every type of scarce material.

To co-ordinate these individual approaches to the housing emergency, and to launch a full-scale attack on the veterans' housing problem, the Office of the Housing Expediter was created by executive order 9686 on Jan. 26, 1946. The housing expediter became administrator of the National Housing agency on Feb. 6.

The housing expediter, Wilson W. Wyatt, was authorized to formulate plans to provide for an increased supply of housing for veterans of World War II. On Feb. 7 the expediter submitted the Veterans Emergency Housing program to the president, who approved it the following day. The program aimed at placing under construction 2,700,000 homes and apartments by the end of 1947—1,200,000 in 1946 and 1,500,000 in 1947. The first year's

goal included 700,000 conventional houses, 250,000 permanent prefabricated homes and homes assembled on the building lot from prefabricated parts and materials, and 250,000 temporary units (200,000 temporary re-use war housing and 50,000 trailers). The goal for 1947 included 900,000 conventional homes and 600,000 permanent prefabricated homes and homes assembled on site from prefabricated parts and materials.

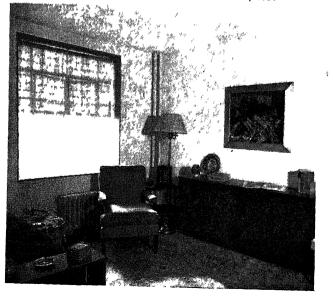

The program launched its first attack upon lagging production in materials, and the diversion of scarce materials to high-priced homes and nonresidential construction. The first order issued by Wyatt under the new program was Veterans Emergency Housing program order 1 on March 26. It called for deferment of new, unessential, nonresidential construction to ease the strain on the many critically short building materials and thus make more of them available for veterans' housing, restricted all new housing to that covered by priorities at \$10,000 or less and required authorization to start any major construction work.

At the same time a campaign for enlistment of community aid was started. Taking a cue from the housing committees appointed in a small number of cities, Wyatt sent letters to the mayors of the major population centres of the country beginning on March 26, requesting them to establish emergency housing committees. These committees were to plan and direct all phases of the local attack on community housing problems. They were to be representative of veterans, local government, builders, materials suppliers and financial, real estate, minority and other business and public interest groups. By Dec. 31, 734 such committees had been organized.

To aid construction of both rental units and moderatelypriced housing, a channelling order was issued on April 21, 1946, requiring 25% of all HH authorizations reserved for rental housing, and 50% of both rental and sales construction to be priced at or below local dividing lines. These dividing lines were based on the local current cost of producing a minimum acceptable two-bedroom house, as determined by FHA standards.

To break one of the building industry's chief bottlenecks-lumber-the National Housing agency reached an agreement with the department of agriculture on May 16 to (1) build access roads to hitherto inaccessible govern-

Typical living room in "Queensbridge Houses" a large housing project in New York city, opened Oct. 25, 1939

ment timber stands and thus increase the U.S. lumber supply, (2) obtain forest service preference for bidders for national forest timber whose output would result in maximum production of materials needed for the Veterans Emergency Housing program and (3) overcut timber beyond normal yield for an emergency period in certain localities of the south and west. The construction or improvement of almost 2,700 mi. of access roads under this agreement was expected to add more than 2,000,000,000 ft. of timber to the nation's lumber supply by the end of 1947. By Sept. 30, 1946, about half of the roads had been started and a substantial share completed.

The Veterans Emergency Housing act, passed by congress on May 22, 1946, reaffirmed the powers granted the housing expediter by the president. It (1) authorized \$400,000,000 for premium payments to stimulate production of critically needed materials; (2) restored title VI of the National Housing act to operation by adding \$1,000,-000,000 to the amount of home mortgage loans made by private lending institutions which the FHA might insure under this title, while permitting the FHA to insure mortgage loans up to 90% of the "necessary current cost" on the property involved, including land; (3) authorized the housing expediter to guarantee markets for prefabricated houses and new types of materials; (4) provided \$15,000,000 for the building of access roads; (5) permitted the sum of \$5,400 for a mortgage loan on a single-family house with a provision that it could be raised to \$8,100; (6) ordered preference on all new construction built with FHA-insured mortgages under title VI occupancy to be given to veterans and servicemen and (7) authorized the housing expediter to control exports of housing materials. One of the major provisions which the housing expediter had requested in his Feb. 7 report to the president—ceiling prices on old housing and on building lots in urban areas —was not included in this bill.

The first premium-payment plan authorized under the Veterans Emergency Housing act became effective June 1, 1946. It set up a system of incentive payments to manufacturers of structural clay products—one of the most critically short building materials; under it producers would be paid \$5 for each 1,000 standard brick equivalents manufactured in excess of established quotas By Nov. 1, 16 premium-payment plans were in effect, covering the major critical building materials.

By midyear it was apparent that authorized nonresidential construction was draining an undue amount of critical building materials away from home building. At the request of the housing expediter, the Civilian Production administration ordered its field offices on May 30 to reduce the dollar value of nonhousing construction authorizations by two-thirds for at least the next 45 days to keep building in line with materials supply. Permitted nonhousing construction was subsequently curtailed twice. Other actions followed swiftly in June: minimum construction standards and inspections by the FHA were established for all HH priority housing; production of every sawmill was brought under government control to boost construction grades of lumber and flooring reserves by more than 4,250,000,000 ft.; \$2,000,000 was made available to the secretary of agriculture for constructing access roads; an emergency distribution system for steel was set up. By the end of the month some 1,900 local apprentice training programs for homebuilding workers had been placed in operation.

July, August and September saw further amplification of the Veterans Emergency Housing program. In July, 26 army and navy installations were turned over to the pro-

gram through the War Assets administration, 21 materials were ordered set aside for housing, army and navy nail supplies were drawn upon to supply home builders and super-HH priorities were established for a 30-day period to rush completion of 100,000 temporary housing units during the next three months.

The major action of August, however, was the announcement of the "big push" to get more materials into veterans' housing, so that more homes could be completed before winter set in and more new home construction get under way. The "push" consisted of (1) setting aside a much greater proportion of scarce building supplies for housing; (2) adding many critical building items to the list of materials under priority control; (3) obtaining stricter compliance by closer inspection of the sale of building materials and (4) cutting the volume of nonhousing construction sharply with a more rigorous review of the essentiality of such construction. "Set-asides" were increased to make it possible for priority holders to obtain needed building materials more rapidly. This was done not only by increasing the proportion of material which had to be held by dealers for priority orders, but also by requiring the dealer to hold this material until a priority order was presented. Formerly, the dealer had been required to "set-aside" this material for only 21 to 30 days for priority orders, after which time he could sell to any purchaser.

By Dec. 31, 1946, a recapitulation of the results of actions taken by the Veterans Emergency Housing program showed both a sharp increase in building materials and a near record-breaking rate of homebuilding. In spite of the obstacles encountered by the program-work stoppages in basic industries, the time required to obtain needed legislation, uncertainties about the fate of price control and failure of prefabricated housing to meet anticipated production goals—the record was impressive, as follows:

Total Units Begun	1,003,600
New permanents	670,900
Conversions	64,500
New traffers	48,000
Temporaries	191,000
Other public bodies, schools	29,200
Total Units Completed	661,900
New permanents	453,800
Conversions	45,300
New trailers	48,000
Temporaries	101,900
Other public bodies, schools	12,900

Gains in building materials production in many instances at least paralleled the fine record of armaments output during World War II, with production of most critical materials in the final months ranging from 50% to 100% higher than at the beginning of the year. By August, the number of workers employed in new on-site construction had risen to 1,800,000 from January's 871,000. Workers engaged in building new homes in September represented a 160% increase over January.

During Dec. 1946, the Veterans' Emergency Housing program underwent considerable revision. Wyatt resigned, and the Office of the Housing Expediter and that of the administrator of the NHA were separated. Raymond M. Foley was appointed administrator, National Housing agency, and Frank R. Creedon, housing expediter. Several restrictions were lifted: the priority system, the \$10,000 sales ceiling on new homes and the confining of new homebuilding for personal occupancy of veterans. The limita-

Prefabricated house in San Francisco, Calif., 11 minutes after construction began, in March 1945. Setting up was completed in 35 minutes

tion on nonresidential construction was modified, and the ceiling of \$80 for rental of new projects was changed to an average monthly rental of \$80. The Federal Housing administration was granted another \$1,000,000,000 of insurance authorization to be used primarily for rental housing. The guaranteed market plan, export controls, and apprentice-training and technical research programs were to be continued. In announcing the new program, Pres. Harry S. Truman stated that the main point of emphasis would be rental housing.

Great Britain.—In the two years preceding the outbreak of World War II the housing movement in Great Britain, which had started soon after the armistice in 1919, continued with increased vigour. A vast building industry had been developed, capable of carrying out mass housing developments on a hitherto undreamed of scale. The building industry was in fact capable of producing more than 300,000 new houses each year.

The outbreak of war in Sept. 1939 brought the housing movement to a standstill. Only those houses which were actually under construction were completed. For the rest, in the general transition from peace to war both building materials and building labour were necessarily diverted to other aspects of the war effort. Confronted by the impressive achievements in housing between the wars, even well-informed people showed a tendency to imagine that Britain had solved its housing problem. The mass evacuation of children from the great cities to safer parts of the country which followed immediately upon the outbreak of war revealed, however, that the facts were quite otherwise. Although it is easily possible to exaggerate, it was nevertheless true that the country people were shocked at the poor standards of health and cleanliness prevailing among the children from the crowded city areas.

On Sept. 7, 1940, the luftwaffe first attacked London in great strength. Huge fires in the docks confirmed that

the East End had been the special target, and there thousands of little houses were utterly destroyed although the raiders had left their imprint on every part of the vast metropolis. Psychologically, the continued bombing of London, the devastating raid on the city area on Dec. 29, 1940, the concentrated raid on Coventry and the later terror raids on the "Baedeker cities" such as Bath and Exeter produced astonishing results. The more the towns and cities of Britain were devastated by the Germans, the more splendid became the vision of the new towns which would rise in their place. Fortunately there was on hand a document of profound significance to give pattern and coherence to what otherwise might merely have been wellmeant, but vague aspirations. Just at the outbreak of war, H.M stationery office had published the Report of the Royal Commission on the Distribution of the Industrial Population, a commission which sat under the chairmanship of Sir Montagu Barlow, and whose report was therefore known as the Barlow report. The royal commission had had its genesis in Sir Malcolm Stewart's third report as commissioner for the special areas-those areas of unemployment and social decay such as South Wales, Tyneside, Durham and Clydeside. Sir Malcolm had pointed to the overgrowth of London as the prime factor in the industrial decay of these regions. The Barlow commission confirmed this and declared that London was a menace, economically, strategically and socially, to the rest of Great Britain. It recommended a policy of decentralization of population and industry into new towns and into extensions of smaller towns.

For the first time a minister, Lord John Charles Reith, was appointed who had as his special responsibility the consideration of the steps that would be necessary to reconstruct Great Britain physically after World War II. He was designated minister of works and planning. Later the government created a new ministry, the ministry of town and country planning, to which W. S. Morrison was appointed as first minister. Lord Reith during his brief tenure of office appointed two committees, one under Lord Justice Leslie Scott to consider the future of rural land use, and the other under Justice Augustus Andrewes Uthwatt to consider the question of compensation and betterment. Lord Justice Scott's committee underlined the recommendations of the Barlow commission in favour of decentralization and pointed to the need for a diversity of industry in the agricultural areas and suggested that in the smaller country towns and villages industries ancillary to agriculture should be established. Justice Uthwatt's committee submitted two reports: an interim report was designed to discourage speculation in land values and recommended that purchase of land by local authorities and the state for reconstruction purposes should be based on its value as at March 31, 1939; and in its final report the committee recommended that the government should buy up the development rights of all the undeveloped land on the fringes of the towns of Britain, that compensation should be paid to the landlords who suffered a loss in value as a result of planning, but that those landlords who gained by planning in that the value of their lands improved should pay on the basis of a five-yearly valuation a tax on "betterment." Since planning did not alter values but merely redistributed them, it was felt that the money paid out in compensation should more or less equal the money collected for betterment. Legislation to this end was in fact introduced into parliament, but in the face of the revolt of the land-owning interests, the relevant clauses were dropped from the bill. When the Labour government was returned to power in 1945, it made reference to com-

pensation and betterment in the king's speech; toward the end of 1946 the legislation dealing with this aspect was introduced into parliament and formed the subject of keen controversy.

In the spring of 1943 Winston Churchill announced the desire of the government to provide houses as quickly as possible after World War II and described in considerable detail a new prefabricated temporary house-popularly named the Portal house, after Lord Portal, then minister of works. About £2,000,000 was spent on research into the Portal house, but it was never produced. The scheme, however, did turn the minds of the builders to the possibility of a departure from traditional building methods and many new types of houses did emerge: the Arcon house, the Uni-Seco house, the Tarran house, the British Iron and Steel federation house, the Weir house, the Atholl house and the aluminum house. All of these, except the last, were the product of private enterprise. The aluminum house was the product of the ministry of aircraft production, later merged in the ministry of supply. Intensive study was given to the question of the equip-

By the end of Nov. 1946, 80,000 temporary houses had been completed and 18,500 were building in the United Kingdom. In the meantime the ministry of health had set up a committee under Lord William Dudley to examine desirable postwar standards for permanent housing. The Dudley report at the end of World War II corresponded to the Tudor-Walters report after World War I. It recommended a vast increase in the space standards of working-class housing—a minimum floor area of 950 sq.ft., with an additional 90 sq.ft. to be provided in the form of a outhouse or workshop.

During the war, too, great consideration was given to the house-work-recreation aspect of building. Ideally, it was seen that a house should be within walking distance of work and also within walking distance of facilities for shopping, entertainment, worship, recreation and all the other activities of a normal fully-developed community. This received its practical application in two ways. In the County of London Plan by Prof. Sir Patrick Abercrombie and J. H. Forshaw, the old communities in London, which had been swallowed up and to some extent lost in London's development, were restored by the process of re-creating neighbourhood units with an average popu-

Temporary prefabricated dwellings built to replace some of the 200,000 houses destroyed by bombs in Greater London during World War II

lation of 10,000 persons, each unit to be divided from the others as far as possible by belts of open space. That was taken to its logical conclusion in the plan, also by Abercrombie, for Greater London, in which the process of decentralization inherent in the County of London Plan was carried a stage farther and a project developed for the creation of 10 to 12 new towns beyond the Greater London green belt. The new towns movement, which had its origin in the Town and Country Planning association, in the work of Sir Ebenezer Howard and F. J. Osborn, and in the garden cities of Letchworth and Welwyn, thus achieved official recognition, and in 1946 a New Towns act was passed by parliament, having been introduced by the minister of town and country planning, Lewis Sılkin. This provided machinery whereby corporations appointed by the minister could be created to carry out the work of constructing new towns. It also provided money for the purpose and stipulated that the state corporations should transfer their responsibility when the towns had reached an adequate stage of development to local authorities democratically elected by the inhabitants of the towns themselves. By the end of 1946 corporations had been appointed in England for one of these new towns (Stevenage), others being under consideration, while in Scotland, the secretary of state for Scotland, who held similar powers under the act, was proceeding with the construction of two new towns, one in the west (East Kilbride) and the other in the east of the country (Lochgelly). It was the first recognition by any government that housing by itself was not enough, that the creation of industrial factory estates by themselves was not enough, but that the two had to be integrated with all the facilities necessary for a full social life. Hoxha, Enver

Hoxha (1908—), Albanian statesman, was a teacher of French before the Italian invasion of Albania in April 1939. He thereupon joined the Albanian resistance forces and took command of a partisan army when German troops landed in Albania to help Mussolini consolidate his tottering position in the Balkans.

After Albania's liberation in late 1944, Hoxha assumed the premiership of Albania, heading a partisan or popular front government. Opposition to his assumption of power immediately sprang up from conservative elements in Albania on grounds that the new government was a soviet puppet. Politically, Hoxha enjoyed warm relationships with the E.A.M. (the leftist National Liberation Front) in Greece and Marshal Tito's regime in Yugoslavia. In Aug. 1946, Hoxha went to the Paris peace conference and asked for a further reduction of Italian armed forces, extensive reparations from Italy and the right to sign the Italian treaty. He clashed with the Greek delegates over the Greek demands for slices of Albanian territory.

On Nov. 8, 1946, the U.S. severed its political relations with Hoxha's regime on grounds that the latter had refused to accept the validity of all prewar Albanian treaties with the U.S. Hoxha charged that the U.S. had obstructed negotiations by its peremptory demands.

Hughes, Charles Evans

Hughes (1862-), U.S. jurist, was born April 11, 1862, in Glen Falls, N.Y., the son of a Baptist minister. He attended Colgate and Brown universities and Columbia university's law school. Admitted to the bar in 1884, he practised law until 1905, except for a brief period (1891-93) when he taught at Cornell university. His introduction to politics came in 1905, when he conducted investigations of gas and insurance companies for the New York legislature. He was elected governor of New York on the Republican ticket in 1907 and was re-elected in 1909. In Oct. 1910 he resigned to become associate justice of the supreme court. Resigning from the court in 1916, he waged an unsuccessful campaign against Woodrow Wilson as the Republican presidential candidate. From 1920-25 he served as secretary of state under Pres. Harding, and from 1926-30 as member of the permanent court of arbitration at The Hague. On Feb. 14, 1930, in spite of the opposition of many senators and of the liberal press, he was appointed chief justice of the supreme court. On the court he was associated with neither the liberal nor the conservative wing; he sustained some of the New Deal measures (NRA, TVA, NLRB, etc.) and opposed others (AAA, SEC), and

generally voted with the liberals in civil liberty cases. On June 2, 1941, Justice Hughes retired from the court. When the chief justiceship was again vacant in May 1946, he declined Pres. Truman's offer.

Hughes, Howard Robard

), U.S. aviator and motion-picture Hughes (1905producer, was born Dec. 24, 1905, in Houston, Tex., the son of a wealthy manufacturer. He was educated in private schools, at Rice institute in Houston, and at the California Institute of Technology. At 18, upon the death of his father, he inherited an estimated \$17,000,000. With this capital, Hughes decided to produce motion pictures. To the astonishment of seasoned Hollywood producers, he released a series of pictures—the first in 1927—that were immediate financial successes. The best known was Hell's Angels, which starred Jean Harlow. In 1934 he incorporated Hughes Aircraft company to build experimental speed planes, and set new speed records for transcontinental and transoceanic flights. In recognition of his achievements, he received the Harmon medal for 1936 and was named the outstanding U.S. aviator of 1938 by the National Aeronautics association. In 1940 he returned to Hollywood and produced a controversial film, The Outlaw, which was banned by the censors and not released for distribution until 1946. During World War II he devoted most of his time to aviation, producing cargo and troop transportation planes. Shortly before a serious crash in an experimental plane on July 7, 1946, he had completed designs for the largest plane ever constructed to that date—a flying boat to move troops and equipment.

Hull, Cordell

Hull (1871-), U.S. statesman, was born Oct. 2, 1871, in Overton (now Pickett) county, Tenn., and graduated from the Cumberland university law school in 1891. He served as a captain of infantry in the Spanish-American war. First elected to congress in 1907, he served until 1931, except for a brief interval from 1921-23. He was elected

Secretary of State Hull and Foreign Commissar Molotov at the Moscow airport prior to the Allied conference which resulted in the pact of Moscow, announced Nov. 1, 1943

to the senate in 1931 but resigned in 1933 to become Pres. Roosevelt's secretary of state. Internationally his name became closely associated with the "good neighbour" policy in South America and elsewhere; he advocated reciprocal trade agreements and the peaceful arbitration of disputes. In Aug. 1943 Hull accompanied Pres. Roosevelt to Quebec, where he participated in the British-Canadian-American conferences. Two months later he travelled to Moscow to confer with Anthony Eden, British foreign secretary, and Vyacheslav Molotov, soviet foreign commissar. This was the first meeting of statesmen of the three countries and foreshadowed the important conferences that followed. In failing health, he resigned on Nov. 27, 1944, as secretary of state. Hull was awarded the Nobel peace prize for 1945.

Humbert II

King Humbert II of Italy (1904-), was born Sept. 15, 1904, the son of Victor Emmanuel III. His education emphasized military arts and sciences and included a period at the Royal Military academy in Turin. He rose rapidly from the rank of lieutenant at 18 to colonel at 26. Because of his alliance with Italian fascists, he was the object of an attempted assassination in Brussels in 1929. In 1930 Humbert married Princess Marie José, daughter of King Albert of Belgium. During World War II, Prince Humbert served as commander of Italy's army of the Alps, with the rank of full general. After the fall of Rome on June 4, 1944, in the hope of pacifying antimonarchist sentiment, he was designated lieutenant general of the realm with all royal powers, King Victor Emmanuel retaining for himself only the title of king of Italy and head of the house of Savoy. On May 9, 1946, Victor Emmanuel abdicated in a final attempt to save the royal house, and Prince Humbert was proclaimed King Humbert II. The act was futile, however, for a plebiscite resulted in the proclamation of the Italian republic on June 3. The royal family, including Humbert, went into exile in Portugal.

Humour, War

The decline of humour accompanied the rise of totalitarianism. But as fanaticism and World War II wiped out wit and humour directed against the party and party officials of Italy and Germany, a contrary development took place within the democracies.

In the United States, government officials and government boards and bureaus co-operated in exposing themselves to fun and ridicule, realizing that morale would rise if people could laugh at the things that were annoying and hurting them. Draft and ration boards, OPA, induction centres, the war department, etc., opened their files, and Dear Sir appeared with laugh-provoking letters received by them.

With the growth of the citizen army, humour developed in the ranks. Cartoonists and writers sprang up among the soldiers and gave vent in positive terms to their gripes and grievances. The cartoon-strip figures of Bill Mauldin's "Joe and Willie" had a touch of Charlie Chaplin pathos that called forth sympathy as much as laughter. For example, one foot-tired dog-face was pictured saying to another: "Do retreatin' blisters hurt as much as advancin' blisters?"

Millions of soldiers identified themselves with George Baker's droopy draftee, "Sad Sack," to whom troubles always came. There was the strip on reveille—Sack, awakened by the bugle, jumps out of bed, thrusting legs into pants as he dashes downstairs. He reaches roll call dressed, but breathless, only to hear: "Fall out." Shut-eyed on his feet, he droops around for hours till assignment—personification of the "hurry-up-and-wait system" of army life.

Yank, Stars and Stripes and about 2,000 other army and navy papers carried these and other cartoons: Milton Caniff's "Male Call," with beautiful racy Lace, who preferred G.I.s to generals; Sgt. Leonard Sansone's "The Wolf," whose wolf-headed doughfoot was involved in semirisqué situations, and David Breger's brash nonconforming "Private Breger." These strips, together with the regular prewar comics, such as "Joe Palooka," the always noble champ fighter, were read by an all-high of about 70,000,000.

Among the books of humour published were: Marion Hargrove's See Here, Private Hargrove, an ingratiatingly funny view of the service; Theodore Pratt's pleasantly sentimental Mr. Winkle Goes to War; Harry Brown's Artië Greengroin, Pfc., which poked fun at the things the average soldier disliked; Bob Hope's I Never Left Home, telling with gags and grief the story of his entertaining the soldiers at the front; Barrie Stavis' Chain of Command, satirizing injustice to the non-coms; H. I. Phillips's Private Purkey's Private Peace—one of the few U.S. war books with humourous twist and political angle. As can be seen, a good part of written and pictorial humour took the form of soldier complaints against army life, red tape and lack of democracy in the fighting forces.

The movies, dispensing humour, remained more or less unaffected by the war. They held to old familiar lines and gave entertainment in routine escapist grooves. There were, to be sure, a sprinkle of so-called "service comedies"—of these, "See Here, Private Hargrove" was the most popular. Now and then a cartoon film brightened the scene, such as Walt Disney's "New Spirit," made for the treasury, which helped to laugh people into paying their staggering wartime taxes.

Like cartoons, radio comedy played a tremendous part in the war effort. Humour was recognized as a powerful weapon, and radio as an ideal field in which to use it. Fibber McGee and Molly had about 40,000,000 listeners every week. Jack Benny, Bob Hope and Charlie McCarthy had about the same number, while Ranald MacDougal's excellent "Man Behind the Gun" had only about 8,000,000. So messages of the greatest national importance were channelled through radio comedy.

Don Quinn built shows for McGee and A. S. Burrows for "Duffy's Tavern," around rationing, bond sales, etc. Radio writers made use of the wide field of topical jokes created by the war to stimulate fun and relieve tensions. As the daily life and relationships of all were wide open for laugh-provoking treatment, humour often developed out of actual experiences that were affecting millions of people in a similar manner. And, because of the need for unity, there was a decrease in derogatory humour directed against racial minorities.

Between their commercial broadcasts, entertainers toured the army camps and the fighting fronts. The armed forces radio service short-waved comedy shows to U.S. troops in India, Africa and the Pacific. They created "Command Performance," which delivered to the soldiers, through broadcasts and recordings, the songs, the patter, the hu-

mour and the contact with home that they craved. Most military leaders realized that laughter was often the difference between sending a fit man to the front or a psychopathic case to the asylum.

* *

In England, the civilian population was under constant attack. The people were being assaulted and destroyed, but they could not fight back like the troops in the field. The weapon that helped to sustain their morale was the mortar shell of explosive laughter. There was more spontaneous humour among the British civilians than the professional humorists could ever hope to portray.

After a bomb hit, a man stepped from the ruins of his home, blood streaking his forehead. A neighbour rushed up to him in great anxiety. "Don't worry," said the victim. "I've had high blood pressure for years, and this is the first time I've felt comfortable."

When the German planes flew over London, a woman called to her husband, "Hurry down to the shelter!"

"I can't. I'm looking for my teeth," he replied.

"Do you think," yelled the old woman, "them Jerries are dropping sandwiches?"

During a blitz, a cab driver stopped at a red light. A U.S. passenger exclaimed nervously: "Speed through to a shelter."

"What!" said the cabby. "And get a summons?"

Grimes produced a telling cartoon of an air raid warden standing at the entrance to a shelter, saying to a departing officer, "Well, come back if you feel nervous."

There was also humour in books. Heath Robinson and Cecil Hunt published How to Build a New World, showing how such oddities as the gas mask and the stirrup pump could be used for pleasures. Kay Grant, an Australian, brought out two books of ribald poetry, It's 'Ard to Stay Clean in the Country and It's 'Ard to Go Wrong in the Cactus. Michael Barsley, a radical with wit, authored Ritzkrieg, Alice in Wunderground and Common Man and Colonel Bogus. S. Evelyn Thomas, collecting jokes and humorous articles, brought out Laughs with the Forces, Laughs with the Navy and Laughs with the Home Front.

The forces themselves produced The Two Types by Jon (W. J. Jones), which appeared in the army news unit CMF (commonwealth military forces). There appeared Prune's Progress, adventures of Pilot Prune known throughout the R.A.F., and Behind the Spitfires, humorous sketches of aircraftsman Plonk and many others, all small publications because of the paper shortage.

The Tommies invented "Chad" and drew his bald head, criss-cross eyes and Durante proboscis on walls, washrooms and even in the officers' quarters with the comment, "Wot, no fags?" or whatever they most missed at the moment.

The R.A.F. created the gremlins with their aerodynamical-shaped heads, green tights, bobtailed frock coats and pointed shoes. They swarmed over British planes drinking gasoline from the tanks, biting control wires and putting ice on wings. Their pranks appealed to the U.S. fighters, and they became a part of the A.A.F.

There were a score or more of top-notch cartoonists who interpreted the British spirit and recorded the humours of the day. David Low, of liberal British tradition, drew political cartoons with wit and emotional force. He created "Muzzler," a combination of Hitler and Benito Mussolini, and "Colonel Blimp," summarizing the die-hard Tory, one of the most comically effective characters of the war.

Two and a half million readers daily watched George Strube's paper players in the *London Express*. His appealing "Little Man," taking all good-naturedly, was welcomed in the United States and other countries.

Bruce Bairnsfather, famous for "Old Bill" of World War I, continued to draw "Old Bill Does It Again" and "Old Bill and Son." Then, assigned to the U.S. air forces, he produced "No Kiddin'" and "Jeeps and Jests."

There were Leslie Illingworth, George Whitelaw, Fougasse (Cyril K. Bird), David Langdon, Pont (Graham Laidler), Leslie Grimes, J. F. Horrabin, Gilbert Wilkinson—all accomplished draftsmen, psychological analysts and students of affairs. Some reviewed world situations, others national news of the moment. But they all had this in common—a good-natured attitude toward themselves and the enemy, a casual acceptance of the tragedies to English life and an understatement of the horrors of war.

Note Thomas Derrick's cartoon. A man in dinner coat stands at the fireplace and, pointing to the wall covered with trophies of animal heads and nazi plane wings, smilingly says to a friend, "Big Game."

There was Osbert Lancaster's Scotch officer, in plaid pants and beribboned cap, remarking to a swank colonel in full regalia, "What I can't understand about the Boches is their passion for uniforms." There were many such sketches wherein the English treated the war as a sporting event and placed the enemy on a par with themselves, to be laughed at as they laughed at themselves, but to be treated with politeness, forbearance and tolerance.

There was a great deal of divertissement throughout the blitz and blackout. Theatres and motion picture houses stayed open most of the time. The E.N.S.A. (Entertainment National Service association) brought shows to both the troops and the factory workers. Entertainers, like others, were conscripted and sent to the front to amuse and relieve the soldiers.

The BBC "Variety Show" set everyone laughing with "Adolph in Blunderland" and "The Voice of the Fuehrer," while Noel Coward broadcast his satirical song, "Don't Let's Be Beastly to the Germans."

Radio comedy had a great triumph in I.T.M.A. (It's That Man Again) with the top-notch comedian, Tom Handley. Handley and his New Zealand-born script-writer, Ted Kavanagh, were the most fertile creators of character radio had produced. Others, such as Vic Oliver, George Formby, Gracie Fields, Binnie Hale, Bebe Daniels, Ben Lyon and the cockney, Jack Warner, dispensed laughter in rich and lavish portions over the BBC network. Bob Hope, London-born, delivered with a U.S. accent gag lines relished alike in both countries. Hal Block, in England from the United States, wrote shows for an Anglo-American series called "Yankee Doodle Doo."

The English and the people of the U.S. were having a great time ribbing themselves and their leaders. Meanwhile, inside Germany, Hitler had decreed death for political jokesters.

* * *

Russians had always been loud laughers. They laughed at funny situations and at the little ironies of life. During the war Alexander Trifonovitch Tvardovsky's epic poem, "Vasily Tyorkin," told with rollicking humour of the adventures of a typical private. Russians would laugh at their own shortcomings and at the failures of their bureaucrats as seen in a humorous magazine, Crocodile, the album of soviet wit. But during their life and death struggle against Germany, their humour was mainly armed and aimed against fascism.

Boris Efimov, and three cartoonists (Mikhail Kupriyanov, Porphyry Krylov and Nikolai Sokolov) collaborating under the composite name of Kokriniski, and thousands of artists in all the cities of the soviet union worked on posters which were displayed everywhere and changed continually. Some were humourous, some gay, some undisquisedly horrifying, but they all carried the stamp of emotional and intellectual intensity. There was a cartoon of a jackass and Josef Goebbels coloured alike, standing side by side, looking up with open mouths. The caption read:

"Which is which? Who can say?
There is no difference in their bray."

The Russians depicted their enemies with bestial faces. Goebbels was portrayed with ratlike body, slimy tail and grotesque head. Sometimes the nazis appeared as gorillas, sometimes as imaginary beasts, such as the man-eating monster, swastika adorned, hairy-armed, with clawlike hands and bloodstained nails, devouring the bones of the defeated while sitting on the skulls of Greece, France and Poland.

All the arts enlisted in the fight for survival and of each one, humour was a vital part.

A series of films was turned out on the exploits of some gnarled old peasants who constantly placed the *Herrenvolk* in humiliatingly ludicrous situations.

Russian entertainers were at all the fronts and carried on under the fire of German guns. The Russian soldiers were adept at creating their own amusements. Gathered around low fires, groups of Red army men, wearing furlined shathas and felt boots, stamped the ground to the rhythm of harmonicas. With congealing breath, they sang rough verses or recited chastushky, the timely couplets of witty commentary on the progress of the war that the Russian poets delighted in recording.

Within the conquered countries there was humour too, humour among the patriots—a grim and terrible kind that went by the name of "gallows humour."

Anecdotes and political jokes were whispered from mouth to ear. One such in Yugoslavia was, "Go ahead and sow," scoffed a German. "We'll do the reaping."

"I hope so," replied the farmer. "I'm sowing hemp."

Stephen, the Czech, drew a cartoon, surreptitiously circulated, of an insignificant little Hitler carrying a large brief case marked "Invasion Plans." He looks up at an imposing statue of Moses and remarks, "Though being racially prejudiced, I would like to know how you crossed the Red sea."

Under their breaths, the Czechs told how, after an intense search, the gestapo found one Czech who claimed to have benefitted by the German occupation. When asked what he did, he replied, "Your Excellency, I am a grave-digger."

In the village of Teplitz Schoenau, a hanged hen was found at dawn with the inscription, "I'd rather be dead than lay eggs for Hitler."

In France they circulated the story of the little boy who in the year 2044 asks his father, "Who was Hitler?" and receives the answer, "He was one of the old boys in ancient history books."

"What did he do?" persists the boy.

"I'm not a teacher," replies the father. "Look him up in the encyclopaedia."

A few minutes later the boy announces, "It says 'Hitler, a robber baron in the time of Stalin."

Pablo Picasso, caught in Paris, was brought to the Kommandant. The latter pointed to a copy of "Guernica" hanging on the wall—a painting showing the havoc wrought by nazi bombers during the Spanish Civil War.

"Did you do this?" shouted the nazi.

"No, sir. You did," Picasso replied.

A butcher shop in Lyons hung the photographs of Henri Pétain and Pièrre Laval at the window and placed beneath them a sign: *Vendu*—Sold Out.

These acts took courage. They bolstered the resistance of the victims and brought anger and fear to the nazis.

Gallows humour, while it could cause death to its adherents, gave hope and strength to the oppressed throughout Europe and helped to speed the collapse of the nazis. (See also Cartoons; Comic Strips.) (J. Ll.)

Hungarian Literature

See CENTRAL EUROPEAN AND BALKAN LITERATURE.

Hungary

As the result of territorial expansion from 1938 to 1941, the area of Hungary in 1942 was 66,409 sq.mi. with an estimated population of 14,733,000. After the axis defeat in World War II Hungary found itself reduced in 1945 to its size of 1938—an area of 35,911 sq.mi. Its population (Dec. 1936) was 8,989,000. The majority of the population was Roman Catholic, but there was a large Protestant and, formerly, a considerable Jewish, minority. Capital: Budapest. Chief cities (pop. 1939 census): Budapest (1,115,877); Szeged (141,254); Debrecen (128,442) and Kecskemét (83,837).

Hungary remained officially a kingdom until Feb. 1, 1946, though the throne had been vacant from 1918. From 1920 to 1945 the royal functions were exercised by a regent, Nicholas Horthy de Nagybánya. On Feb. 1, 1946, the republic was proclaimed. President (for a four-year term): Zoltan Tildy, Prime minister (1946): Ferenc Nagy. (X.)

Herald of Fascism.—Already at the beginning of 1937 the fate of Hungary was sealed. In the European constellation of that time its place, from the very first, was assigned beside that of fascist Italy and nazi Germany. Nicholas Kállay, then premier, spoke the truth when, in a speech made on Oct. 20, 1942, he boasted that neither Italian fascism nor German national socialism had introduced any novel idea; all that Benito Mussolini and Adolf Hitler had introduced were in the essence of the Szeged idea. Horthy's counterrevolution of 1919 was the herald of fascism in Europe. The only thing he failed to do was to elaborate in detail the organized construction of fascist ideology. The social demagogy of fascism and naziism was also lacking in him, all the more so because Horthy, after overthrowing the revolutions of 1918-19, re-established the semifeudalistic Hungarian large estate system, with the only difference that, from that time on, it was not so much the aristocrats who defended the privileges of the large estate owners, but the praetorian guards formed from the impoverished gentry, the chauvinistic upper middle class who, for their counterrevolutionary services, gained important positions in state politics.

All that characterized fascist foreign policy could be found in the Szeged idea: chauvinism, militarism; the mass organization idea so characteristic of fascism was, however, lacking in the internal policy in spite of its antiprogressive, antiliberal and anti-Semitic character. Horthy and his satellites were satisfied with inaugurating the middle classes into various race protective and chauvinistic social unions, but they kept their hands off the peasantry and working classes, because they wanted to keep these masses away from politics at any price, and took great care to safeguard the Hungarian gentility. The gradual militarization and

organization of the masses began only in 1932, during the premiership of Julius Gömbös.

The defense of this semifeudalistic order, the maintenance of this burdensome anachronistic and contradictory system was only possible, as at the time of the Austro-Hungarian monarchy, by dependence on such reactionary foreign powers who supported aggressive foreign political endeavours that served to conceal internal difficulties. The aggressive revisionary policy of the Horthy system, which proved a Fata Morgana to the country in consequence of the peace treaty of Trianon, from the very first rendered reconciliation with the neighbouring states impossible, as it reclaimed the thousand-year-old frontiers, which in reality meant the liquidation of the successor states, Czechoslovakia, Yugoslavia and Rumania, and the oppression of the Czech, Yugoslav and Rumanian nationalities.

It was for this reason that Count Stephen Bethlen, the so-called consolidating premier of the Horthy system (1922-31), rejected the proposition of Thomas Masaryk, president of the Czechoslovakian republic, for the restoration of the frontier territories peopled by Hungarians. He could not renounce the advantages which the revisionist policy afforded him in internal and foreign politics. From the very first the revisionist propaganda at home and abroad was carried on with indefatigable force. Bethlen, of course, first found an ally for his policy in Mussolini's Italy, but at the same time endeavoured to exploit the differences arising on the continent between France and England; as France supported the Little Entente, Bethlen endeavoured to gain the support of England. Lord Rothermere, an English publisher, became the greatest exponent of Hungarian revisionism, which later was so absurdly exaggerated that many Hungarians wished to make Rothermere their king.

Then, with the extension of fascism and naziism, the praetorian group came to the fore in Hungary, too, from among the ranks of army officers, civil servants and the middle classes in general, who awaited realization of the revisionary endeavours from the accomplishment of similar German and Italian aims. The most noted executor of these endeavours was an officer of Horthy's and Bethlen's making, Julius Gömbös. Gömbös became premier on Oct. 1, 1932, one month before the memorable German elections in which the National Socialists consolidated their position as the strongest party in Germany. On Jan. 10, 1933, just before Hitler's rise to power, Gömbös took over the additional office of foreign minister. From that time on, the connections between the two countries became ever closer, and when Mussolini still resisted Hitler because of Austria, it was Gömbös who first brought up the idea of a Berlin-Rome axis; moreover, it was he who coined the word "axis."

Double-Sided Policy.—Legalization of the quasi-parliament, the Social Democratic party, the trade unions and other similar democratic concessions saved Hungary from being booked by the west as a fascist and totalitarian state. On the other hand, this enabled the Horthy system, right up to the end of World War II, to carry out the "two irons in the fire" tactics with, however, certain divergencies, and at the same time an ostentatious pose of independence in foreign policy too. This is how, with constant changes, the definitely pro-German, the vacillating pro-German and, in a lesser degree, the anti-German elements could exist within the system.

For the sake of agricultural export to Germany the greater part of the large estate owners took no notice what-

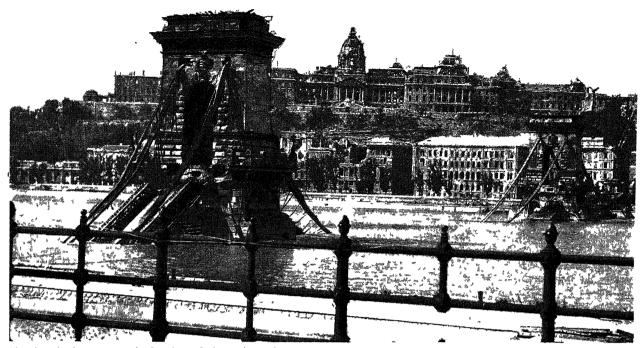

ever of the social agitation of the openly pronazi Hungarian quislings. A smaller part, together with the clerical majority, were legitimists and Habsburgers, for they saw the security of their future only in the mask of policy. Of the army 90% sympathized with Hitler. The trade concerns and banks, the civil servants and representatives of the government (80% of the parliament) were divided in their opinions, but later, with Hitler's advance, allowed themselves to be guided by the one governing idea.

Julius Gömbös died on Oct. 6, 1936, at the beginning of the last historical phase prior to World War II. During his premiership, the League of Nations discussed the complaint brought forward against Hungary by Yugoslavia, according to which the Croatian Ustashi were trained in Hungary at Jankapuszta. Gombos' League of Nations representative, Tiberius Eckhardt, was a member of the opposition who, at the beginning of the counterrevolutionary era, belonged to Gombos' extremist circle but later joined the anglophile group of the system. He played the part of the second "iron" which was constantly held in readiness, a part which, for a long time, seemed to be an ungrateful one, but which fact did not keep him from standing by Gömbös in the Jankapuszta affair.

Horthy, the Hungarian Pétain.-From 1937, after the death of Gombos, Hungarian foreign and internal policy was governed by external events insofar as the internal situation permitted. The path led straight to destruction. What happened between 1919 and 1937 had sealed the fate of Hungary. Already at that time the Hungarian system dangerously resembled the picture which later Vichy France portrayed in its connection with Germany. Horthy always considered the internal enemy greater than the external, and, for the preservation of the system and the Hungarian large estates, cast aside all patriotism. But at the same time he was afraid of the Doriots and Déats, because they followed too strong a social demagogy. There were the Hungarian go-between Lavals, who at the time of the German political and military victories were placed in the foreground as absolute pro-Germans, but who, in internal politics, were after all not nazis and were exchanged after German political or military defeats for the Flandins, Darlans and pro-Anglo-Saxon politicians. Horthy did not take definite steps against Maj. Francis Szálasi and his followers because, to a certain extent, they were not only Hitler's reserves, but his too. Hitler followed the same tactics toward Horthy as toward Marshal Pétain and other satellites. From the point of view of the maintenance of law and order, Horthy was preferable to Szálasi and the nazis, because through him he could utilize Hungary as a larder. To the Hungarian feudalists, as in France and elsewhere, he appeared as the defender of order and property. To the Hungarian farm labourers and workers he stood forth as the apostle of the new social order. Thus, he kept both classes in check. This situation prevailed, with smaller or greater variations, during 1937-45 and placed extraordinary tasks on the shoulders of those Hungarians who in a brave and unrelenting struggle strove to attain the impossible, to persuade into opposition the masses who for two decades had been living under suppression and were infected by revisionist, antiliberal, anti-Semitic and antisocialist propaganda.

But the mental and working elite could not prevent the catastrophe because they could not successfully counterbalance the backwardness of the Hungarian social order and the stupor of the masses.

Italian-Hungarian-Austrian Alliance.—After the death of Julius Gömbös, Koloman Darányi, a member of the large estate class, became premier. Darányi led a firmer policy

The chain bridge spanning the Danube at Budapest lay under water after the violent siege of Hungary's capital in 1945. Across the river, the royal palace and the buildings lining the shore below stood in virtual shambles

against the open fascists and Nyılases, the so-called Arrow-Cross party. Primarily, this was for a foreign political reason: Mussolini's temporary resistance to Hitler's anschluss endeavours. After Horthy's visit to Rome in Nov. 1936, the Hungarian ruling clique played with the thought that an Italian-English-French agreement might come to pass, and so to a certain extent it would have to modify its revisionist policy.

During 1937, considerable thought was given to an Italian-Austrian-Hungarian treaty. Darányi and Koloman Kánya, minister of foreign affairs, tried to advance their revisionist aims with a new power-seeking assemblage, in place of the Gombös axis' "rearguard." They tried to break up the Little Entente and, instead of emphasizing their friendship toward Germany, turned toward Italian fascism. From an internal political standpoint it was more agreeable for them to hold with Italian fascism, which had worn off its aging and social demagogy, all the more so since they could thus better get the west to accept their semifascistic system and so secure this system in any event. It was for this reason that they maintained, throughout the fatal period, their quasi-parliament chosen by open elections everywhere except in the cities.

Nothing characterized the semifeudalistic and semifascist system better than the fact that the peasantry was forbidden by law to form trade unions and the Social Democratic party was forbidden to undertake any kind of political activity in the villages—and this in a country where more than 55% of the population comprised peasants and farm workers. The agricultural population was excluded from all health insurance, and no worker, industrial or agricultural, was entitled to unemployment benefits. At the bottom of Hungary's social and political reaction lay the distribution of the land. The census of 1930 showed that out of a population of 8,500,000, 1,000,000 rural workers had no land of their own; in addition to these there were 600,000 domestic labourers on the large estates and 300,000

owning less than 1 ac. After the so-called land reform in 1920, 36 large landowners still owned the same acreage as 1,184,783 peasants who had less than 5 ac. each.

In 1937, Hungarian statesmen visited Rome and Vienna, while Italian and Austrian leaders went to Budapest. On May 19, the king and queen of Italy visited Budapest. During a toast at the reception, Horthy referred to the Triple alliance as the firm column of peace. On May 26, Koloman Kánya, minister of foreign affairs, announced that the autarchy of the Little Entente had proved a failure in the Danube basin.

The foreign political tactics of Kánya at that time consisted of a struggle for the equal rights of Hungary and the ever increasing defense of the Hungarian minorities, instead of emphasizing the sincere revisionary aims and, with the help of Italy, the endeavour to tear Yugoslavia from the Little Entente.

At the same time, Horthy's power in internal policy was strengthened. On June 25, 1937, the government introduced a bill in connection with the extension of the regent's jurisdiction. Horthy, who had already held the right to prorogue or dissolve parliament, thereafter held no responsibility toward the parliament whatever.

Anschluss and its Consequences to Hungary.—It was evident that the policy of Darányi and Kánya was built upon illusions. Neither Italy nor the Italian-Hungarian-Austrian alliance had an appropriate economic basis for the continuance of a long-lasting independent policy. In The Bloodless Invasion (London, 1940) Paul Einzig described how the nazis conquered the Danubian countries. Hungary was one of their complete victims. Already in 1937, 50% of the Danubian countries were in their hands. Germany deliberately contracted large debts. From 1933 on, the nazis adopted a policy of buying the largest possible quantity of goods from the small eastern European countries. In this way they were bound through their claims to Germany. In addition, Germany absorbed the market of the small countries, reselling abroad at a very low price for cash the commodities which it had acquired from them and for which it had not paid. In this way Germany ruined the markets

for Danubian and Balkan exports. In exchange for commodities, Germany, in several cases, supplied the small nations with arms. Even though the material was secondhand it was better than nothing; with German arms deliveries the influence of the small countries naturally grew stronger. Hungary became completely dependent on Germany economically. For any possible advantage it could gain out of the transaction Hungary had to give political concessions such as more independence for the German minorities and pro-German orientation; in short, the strengthening of the position of the Hungarian quislings. As economic advantages were linked closely to the German policy, many were tempted to follow it. Although the successive governments were on the whole pro-German, there was an additional need for an organized German volkstum, controlled by demagogic quislings.

The meeting of Hitler and Mussolini at Munich in Sept. 1937 brought about a change in Hungarian politics. Hungary again followed the path Gömbös had prepared, though not unanimously. Two months later Darányi and Kánya travelled to Berlin. It then became evident that Hungary, with Mussolini, would drop Austria. The great Austro-Hungarian friendship, in which the collaboration of the Heimwehr fascist ideology and Horthy's ideology played a great part, fell to pieces since it no longer suited the requirements.

On Jan. 9, 1938, the Austrian, Hungarian and Italian ministers of foreign affairs again met in Budapest for negotiations. The published communiqué clearly showed that Austria was lost. The first paragraph of the communiqué emphasized the closest collaboration with Germany, the second paragraph the struggle against Bolshevism. As a result of these negotiations Hungary recognized Francisco Franco, but received a guarantee that it could declare its equal rights to rearm. At the same time, Hungary was directed to seek reconciliation with the Rumanian Goga government of the extreme right, which had meanwhile been formed. They endeavoured to make the encirclement of Czechoslovakia complete.

On Feb. 3 the extremist powers obtained the upper hand within the Hungarian government party. The pro-German, Andreas Tasnádi Nagy, was nominated president of the party and the government was changed. Adalbert (Béla) Imrédy became minister of economy and Louis Remenyi Schneller minister of finance. Meanwhile the fascist bloc was doomed to an unforeseen disappointment. Goga's government in Rumania failed, but Hitler, at that time, had other things in hand; he arranged a concentrated attack against Austria. The fate of Austria was sealed on March 11, and Germany became Hungary's neighbour. On March 16, Mussolini, the one-time protector of Austrian independence, swore to German-Italian friendship, and Horthy naturally fell into line. On April 8 the first anti-Semitic bill which thoroughly curtailed the rights of the Jews was introduced in parliament. This new anti-Jewish law was really the second in the history of the Horthy system; Horthy had introduced the first in 1920, a numerus clausus at the universities directed against the Jews.

Appeasement.—The policy of appeasement hastened Hungary's alignment with Hitler's policy, and the most pro-German politicians came to the front. When, on April 22, Neville Chamberlain announced that he wished to reorganize the League of Nations on the basis of a great power pact, Hungary made preparations for a sterner revisionist and antibolshevistic foreign policy. On May

13, 1938, Darányi resigned and Imrédy, who had won the confidence of British circles, was made premier as the double-dealing Hungarian politicians took great care to remain at least acceptable to the west too. It was then that the foreign political offensive aimed at blockading Czechoslovakia began. On July 17, Imrédy and Kánya visited Rome.

When Konrad Henlein began his activities in the Sudetenland, the Hungarian minority also went into action. On Aug. 3 the Czechoslovak-Hungarian party, which did not succeed in winning over the whole Hungarian people, claimed entire equality and self-government.

On Aug. 21, on Hitler's invitation, Horthy and his wife took part in a festival of the fleet and the regent launched the "Prinz Eugen." Events followed in quick succession. The German-Czechoslovak conflict found the Hungarian government quite prepared; in internal policy too, naziism and fascism had gained ground. Corporation chambers were established. At the time of the Munich agreement Hungary aided in hastening the fall of Czechoslovakia. Mussolini, now within the axis, again stepped forth in the interest of Hungary, this time more energetically and, on Oct. 3, claimed the whole of Slovakia on its behalf. But Hitler supported an independent Slovakia, which, on the one hand, meant a greater help to him in the suppression of Czechoslovakia, and, on the other hand, a suitable rear guard against the Hungarian policy.

As a result, there was much delay in the fulfilment of Hungary's claims. Slovakia, with Hitler behind it, resisted all claims, and on Oct. 13, Hungarian-Slovak negotiations were interrupted. Finally, on Nov. 3, the Italian-German court of arbitration convened in Vienna, in consequence of which Hungary recovered a part of the Felvidék. Hungarian revisionists celebrated the event. Horthy was nominated augmenter of the country. Premier Imrédy, Minister of Foreign Affairs Kánya and Paul Teleki, minister of culture, leaders in the negotiations, received the great cross of the Hungarian Order of Merit. On Nov. 9, Lord Rothermere, the apostle of Hungarian revisionism, was welcomed to Budapest so that "English friendship" should not be left out of the game.

With the first "gifts" from Hitler and Mussolini, the aims of territorial expansion were partially realized, and thus there was no stopping the leaders of the movement.

After 18 years of revisionist policy they had led the country straight to its doom. For the masses the opium dreams became reality. In this question there were no differences of opinion between the politicians and the economic leaders. Even at that time, like a grim eminence, Stephen Bethlen stood at the back of Horthy. In spite of his reserved bearing he was in accord with Horthy and his official government with regard to general foreign policy. He wished only for a sterner policy against increasing agitation of the extremist Nyilas party, and so, behind the scenes, he agitated against Imrédy, who in the meantime had veered toward the right. With the help of the small group of legitimate large land proprietors and capitalists, who were afraid of social demagogy, Bethlen succeeded in ousting Imrédy, by ascertaining that anti-Semitic Imrédy had Jews among his ancestors. When Horthy informed him of this, Imrédy collapsed, and on Feb. 15, 1939, he resigned. His successor was Count Paul Teleki, who stood close to Bethlen and who imagined that with the realization of expansionist aims and the consolidation of the semifeudalistic and semifascistic system, Hungary could maintain its national independence and take no part in the forthcoming war. Teleki knew that entering the war would mean the end of the system if

Germany were defeated, while if Germany was victorious, it would mean the end of independence. Of course, Germany, realizing this policy, strengthened its reserves, the Nyilas party, but Teleki counterbalanced this move by trying to take the wind out of Nyilas sails. He quickly brought into force a more stringent anti-Jewish law. The open nazis, knowing their strength, successfully clamoured for the introduction of a new election law which commanded secrecy, but at the same time, with various restrictions, excluded the greater part of the workers and peasantry from the ranks of the voters.

On Feb. 22, 1939, Teleki delivered a significant speech in which he declared "We wish the thousand year old Hungarian idea to be respected." He went even further. On Feb. 24, he banned the right-wing Hungarista party. In foreign politics, however, he was prisoner of his own program and the whole of Horthy's political system of two decades. Also on Feb. 24 Hungary joined the anti-Comintern pact.

On March 15, 1939, at the same time as Hitler's march on Prague, Horthy's soldiers marched into Ruthenia, in the eastern part of Czechoslovakia, where a great part of the population was Ruthenian. With this step Hungary bound its fate more closely to that of Hitler's. That there was hardly any difference between Bethlen's foreign policy, and that of the Nyilaskereszt party, needed no better proof than Bethlen's article of April 11, 1939, in the moderately conservative Pesti Hirlap which stated that: "It is far better for the small States to ensure their independence through close friendship with Germany if necessary, even at the price of certain concessions."

In the Drift of War.—In the national assembly elections of May 30, 1939, the government party won by a great majority, although a part of the middle classes was already on the side of the open nazis. Under the leadership of the accused Imrédy, who had become a staunch supporter of naziism, 61 right-wing extremists and Nyilas members obtained seats in parliament. This fact and the growth of Germany's economic influence rendered the successful continuance of the swinging policy of Teleki and his satellites quite illusory.

For a time the German-Russian pact signed in Aug. 1939 checked the favourite antibolshevistic policy and made manoeuvring more difficult, for side by side with the anti-Semitic slogans the bolshevistic bogey was the bone of contention thrown to the dissatisfied masses. Thus, Horthy's revisionist claims had to be more strongly emphasized, which incidentally drove the country more closely into the arms of Germany. After the outbreak of World War II in Sept. 1939, Teleki and his followers, with the aid of social-political "drops of oil" and chiefly on account of the prosperity derived from the German military orders, were able to counterbalance the demagogy of the Nyilas party, the only tendency of which was to compel the reigning clique to back Hitler unconditionally. Hitler by no means wanted to create a disturbance in his "larder" because he was in great need of Hungarian wheat, bauxite and other commodities.

Thereafter, the revisionism of Hungarian foreign policy continued apace with the success of German arms. At the time of the "phony war," Hungary cast an eye toward the west too, in the hope that the Chamberlain government would make peace with Hitler, a peace which would have strengthened the Hungarian system.

Hitler's victory over France in 1940 also blinded Teleki, and again the expansionist idea proved stronger than tactical tendency. After the German occupation of Paris, Teleki lost no time in wiring Hitler and declaring that Dismemberment of the still-resistant Rumania in 1940 afforded another opportunity to strengthen the chauvinistic endeavours. On July 9, 1940, Teleki and Minister of Foreign Affairs Csáky travelled to Berlin. Their visit brought about the second Viennese decision (Aug. 30, 1940) in which Joachim von Ribbentrop and Count Galeazzo Ciano awarded Hungary the northern part of Transylvania. As in the first Viennese decision, Mussolini supported Hungary, but Von Ribbentrop did not fail

the Europe of Trianon no longer existed.

to make Transylvania an instrument of blackmail. During the continuation of the war the Germans alternatively threatened Hungary with the granting of Rumanian requests, and Rumania with the statement that it would be deprived of the southern part of Transylvania.

In Hungarian internal policy, meanwhile, the changing of the guard was continued. The third anti-Jewish bill was passed with increased enforcement but still not with the severity of the laws of Nuernberg. The Jewish question was a good card to play in the maintenance of Hungarian policy toward England, which as yet had not become estranged. Most of the Jews were thrown into labour camps, where they were badly treated but, as yet, not annihilated.

Horthy and his followers were alarmed at the consequences of their policy, and after the first English victories in Africa in the autumn of 1940, they again swung the pendulum. On Nov. 20, 1940, after having hastily joined the German-Italian-Japanese Tripartite pact, Hungary sought a treaty of friendship with Yugoslavia. On Dec. 15, in their joy at the re-annexation of Transylvania, Hungarians swore allegiance to the Szeged idea, i.e., the large estate system and revisionism with the cry: "From Szeged to Zágon."

On Jan. 21, 1941, Csáky suddenly died under suspicious circumstances, and the pro-German Ladislas Bárdossy took his place; yet Teleki on Feb. 21 succeeded in bringing about the signing of the contract of "eternal friendship" between Hungary and Yugoslavia.

On March 8, in a move to ensure himself against the possibility of an Anglo-Saxon victory, Horthy sent Tiberius Eckhardt to the United States. On March 27, the Yugoslav coup d'état also brought about a crisis in Hungary and placed Teleki in a critical situation. He had to break the contract of friendship signed only a few weeks before. There was no escape from Germany's embracing arms. On April 3, Teleki committed suicide, the victim of his own policy. The details of his death were not cleared up.

Ladislas Bárdossy became premier, and on April 10 Horthy gave the order for Hungarian troops to march into Yugoslavia. In consequence, England broke off diplomatic relations with Hungary.

After the new German victories in the Balkans, Hungary for a time gave up its swinging policy and carried out all that Germany demanded of it. Horthy then served Hitler without any direct interest. On June 29, 1941, Horthy and Bárdossy led the country into the war against Russia.

When in 1946 the Hungarian Democrats put Bárdossy on trial on a charge of war guilt, it came to light that Horthy and Bárdossy had had the town of Kassa bombed to serve as a pretext for the declaration of war.

Bárdossy consoled the Hungarians by telling them that the new Europe claimed only economic sacrifices from Hungary, for they were terrified by the war. The ranks of the opposition swelled, mostly from among the labourers and intellectuals. Bárdossy and his followers invented the

slogan, "much bread and little blood," with which they deluded themselves for a number of months.

Hitler, in the hope of a speedy victory, at first demanded only one mechanized army corps from Horthy. This Hungary granted him and thought that all was settled. The anti-bolshevistic agitation surpassed all expectations, and the war seemed only ideological. On March 8, 1942, Nicholas Kállay took Bárdossy's place as premier. Bárdossy had been too openly a nazi agent, and the increasing sacrifices of World War II could be thrust upon the people only by a more acceptable politician from the Teleki-Bethlen group. Hungary was also counting on the possibility of a change in the fortunes of war and had to make preparations accordingly. But for the time being there was no question of such a change, because the summer of 1942 was again favourable for the Germans. Nevertheless, Hitler demanded more and more "blood" from Hungary. Except for a few brave organizers, there was no serious resistance. The still-tolerated trade unions, together with the Social Democratic party, endeavoured to stir up resistance, but with little success. The antipathy of the Hungarian educated classes was marked.

Kállay, in a speech at a meeting of the grand council of the government party on April 20, 1942, said: "We go to war voluntarily, not driven into it, not coerced by anyone. . . . For this war I take the whole responsibility upon myself. . . . I take the responsibility because I know why we have to fight." After his visit to Hitler at his head-quarters on July 1, 1942, Kállay declared: "I am convinced that, after victorious battles, this summer will clear up the European situation and already in this year the reformation of the New Europe can begin."

In the autumn of 1942, after Stalingrad and the Allied landing in Africa, a great change came into Hungarian politics. Kállay resorted again to his swinging policy and afforded great scope to the legal opposition, the Social Democrats and smallholders, in order to prove to the west that Hungary was "democratic."

The persecution of the Jews also abated after the summer and autumn of 1942, but thousands of Jews had already died in the labour camps and on the Russian front. Then came the catastrophe of Voronezh. On January 25, 1943, almost the whole of the 2nd Hungarian army was annihilated. Kállay and his satellites did not dare to reveal the truth, and dissatisfaction increased in the country. The legal opposition still was apathetic; instead of preparing for organized mass resistance, it was satisfied by fighting with words only. In the press of the opposition, a slightly anti-German tone was discerned; organization began in working class circles, but not a word about armed resistance was uttered. A few leaders, however, together with the London and Moscow emigrants, warned the Hungarian people that only open fighting on the side of the Allies could save them from a catastrophe. Meanwhile, Bethlen, by way of Stockholm and Ankara, offered his services to Adm. Jean Darlan but stipulated such conditions that the Allies rejected them entirely.

The columns of the government's semiofficial organ, Pester Lloyd dealt with proposals of rapprochement with the Allies as early as Jan. 1943, but the offer was energetically rejected by way of the British Broadcasting corporation.

Hitler, meanwhile, had had enough of this double-dealing policy, and the members of the Nyilas party increased their agitation. It became evident that the government

policy could not last. After Mussolini's fall the Kállay government became more and more desperate. The general tone was quite different from that heard in 1942; it was now not a question of an ideological but of a "compulsory" war.

On Jan. 1, 1944, former Premier Count Michael Károlyi addressed a message from London by wireless to the Hungarian people, warning them of the great danger and advising them to organize partisan fights and mass resistance. On March 19, 1944, Hitler marched into Hungary and Horthy gave himself up. Even then he preferred the Germans to resistance, for he was afraid that the latter would mean his end. Kállay fled to the Turkish embassy and Döme Sztojay, ambassador to Berlin, took over the leadership of the government. The Nuernberg laws were immediately brought into force, and in the summer of 1944 the deportation of the rural Jews to Auschwitz began. The united front of the national independence front was created with the participation of the Small Landowners, Social-Democrats and Communists. A part of the legal opposition was imprisoned or deported, the rest merely being declared illegal. Andrew Bajcsi Zsilinszky, leader of the anti-German Small Landowners, was captured, but not before firing at the members of the gestapo who arrested him; he too was wounded. Among the civilians, this shot was practically the only manifestation of resistance. So far there had been martyrs only from the ranks of the Communists.

Collapse and Liberation.-The continued series of German defeats in the summer of 1944 again resulted in a slackening of nazi pressure. Sztojay resigned and Horthy entrusted Col. Gen. Vitez Geza Lakatos with the reformation of the government. Rumania's unconditional surrender on Aug. 23, 1944, left Hungary the only remaining satellite of Hitler. As soon as the Russians crossed the frontier into Hungary, the Lakatos government began its armistice negotiations, but Horthy hesitated until the last minute and could neither bring himself to come to an agreement with Arpad Szakasits, leader of the illegal Social-Democratic party, and Ladislas Rajk, leader of the illegal Communist party, nor break away from the Germans. At last, after his son Nicholas had been abducted by the Germans on Oct. 15, Horthy announced by radio that he would break off relations with the Germans and called for an armistice, but in a few hours this unpremeditated change also ended in failure. Horthy became a prisoner of the Germans and not only withdrew his announcement but also handed over his power to Maj. Francis Szálasi, leader of the Nyilas party. Thereupon, the Nyilas reign of terror began; with its slaughter and deportation of tens of thousands and its unbridled terrorism, it exceeded by far the cruelties of the German nazis. The Nyilas regime in Hungary lasted from Oct. 15, 1944, until April 4, 1945, but always on a gradually decreasing scale; liberation of the eastern part of the country right up to the outskirts of Budapest had been effected by the red army as early as Nov. 1944. In December the northern part was also liberated and on Dec. 24, the siege of Budapest, which lasted 52 days, began. This event, because of the treachery of Horthy and the Hungarian Nyilas party, caused incredible suffering to the population. All the Danube bridges were destroyed by the Germans; the city, especially Buda on the right bank of the Danube, was reduced to ruins. Not only Budapest, but the whole country suffered the pangs of war. Few villages stood intact. In addition, the Nyilas party and the Germans carried away everything that could be moved; machines, agricultural implements, whole factory plants, hospital equipment, laboratories, raw materials, the gold of

the National bank, ships, engines, railway equipment and 70% of the livestock. As soon as the west of the country had also been liberated after strenuous fighting in February and March, Hungary was a picture of utter destruction. Only the great desire of the population to live helped the country through this period. The comparatively small group of resisters, who, from the very beginning of World War II rallied into the Hungarian national independent front, organized national committees everywhere and immediately began to build the country from its ruins.

In Szeged on Dec. 5, 1944, the Hungarian national inde-

pendent front, which then consisted of the Small Landowner, Social-Democratic, Communist, National Peasant and Civil Democratic parties, introduced a new democratic program and completely broke with the past. Between Dec. 5 and Dec. 13, 1944, a committee was formed from the delegates of the national independent front which organized the temporary national assembly. This committee called upon the freed towns and villages to choose their delegates. Elections were held between Dec. 13 and 20, in such a way that the organs of local public administration, the parties, trade unions, agricultural unions, industrial unions and other public organizations, chose their delegates for the national assembly.

The temporary national assembly convened at Debrecen in the Protestant college on Dec. 21, 1944. On Dec. 22, the temporary national assembly chose a political committee to pave the way for election of a temporary government. On Christmas eve, 1944, the temporary national assembly elected the temporary government. • Adalbart Nicholas Dálnoki, the commander-in-chief of the former first Hungarian army, who at the last moment went over to the Russians from the circle of the Hungarian general staff, became the premier of the temporary government, which consisted of representatives from the parties of the independent front.

The most important points of the program of the national assembly and government were the ensuing armistice with the Allies, the safeguarding of liberty and democratic rights, the taking over of the administration of the country and, above all, the extensive territorial reform and distribution that broke the backbone of the feudalistic class.

On Dec. 26, 1944, the temporary national assembly declared war on Germany. On Jan. 10, 1945, the Allied Powers and Hungary signed the armistice in Moscow.

Hungary: Statistical Data

gary was born during World War II and was based on the collaboration of all anti-German forces indispensably resulted in many former Horthyists joining the democratic camp. In spite of this, the execution of the land reform was immediately put into force. It was evident that the hasty distribution of land, from a national economic standpoint, could not be done without mistakes and inequities. By the immediate compensatory expropriation of every estate consisting of more than 1,000 ac., however, and by permitting only 100 ac. to be retained from among the 100 and 1,000 ac. estates, it was possible for 600,000 landless peasants (1,800,000 in all, together with their families), to sow and reap for the first time on their own parcels of land, averaging about 5 ac. each. As the country was .liberated piece by piece, the distribution of land was immediately put into action. The greater part of the proprietors, together with the Germans, had escaped toward the west, but the Germans took with them all the agricultural equipment. The hard work of the peasants, however, helped save the country from famine. The Hungarian workers, too, resumed their work immediately. In Budapest, after the final liberation on Feb. 13, 1945, and after the transference to the capital of the temporary government, electric and gas utilities were re-established in less than three months.

The terms of the armistice were severe, but after the loss of the war it was somewhat of a miracle that the country's independent existence was permitted at all. The nation had to withdraw to its frontiers of 1938, and an allied control committee was established in Budapest to see that the government respected the Armistice agreements.

During 1945-46, Hungarian democracy passed judgment on many war criminals. The chief war criminals: Ladislas Bárdossy, Adalbert (Béla) Imrédy, former premier, Francis Szálasi, the Nyilas leader, and many others were executed. Horthy, who was taken into custody by the Germans on Oct. 15, 1944, and was later captured in Germany by the Americans, was not claimed as a war criminal. The more advanced elements were in no doubt of his guilt for the highest power had always been in his hands, but this was expressed only by democratic re-educational propaganda.

The great lack of commodities and the critical material losses of the country resulted in the greatest inflation in history, which aggravated the suffering of the population of the country. In spite of this, reconstruction was carried on. To a certain extent inflation raised the money for the expenses of reconstruction.

After liberation two new bridges were built across the Danube in Budapest and the traffic system was also restored. The factories re-attained 60% of their prewar production.

Reparations (\$300,000,000) and the troops of occupation were great burdens on the country, and the help received from the United Nations Relief and Rehabilitation administration and other foreign relief sources was far less than that rendered to the victorious countries or even to Austria. Yet stabilization of the currency was the greatest achievement of the country in the early postwar period.

In Nov. 1945 Hungary, for the first time in history, held a general secret-ballot democratic election, in which the nonsocialist, democratic party of the coalition, the Small Landowners, won 58% of the votes, the Labour party 34% against 8% won by the National Peasant party. On the basis of this election the new national assembly was formed, then later, the new coalition government, pre-

sided over by Zoltán Tildy, leader of the Small Landowners. In Feb. 1946 the grotesque kingless kingdom of 25 years' standing, was abolished and the national assembly voted the new republic a constitution. Zoltán Tildy was nominated president of the republic, while Ferenc Nagy, new leader-of the Small Landowners became premier. Mathias Rákasi, leader of the Communists, and Árpád Szakasits, leader of the Social-Democrats, were nominated deputy premiers in the government.

Within the coalition there was a constant conflict between the Social-Democrat, Communist and National Peasant parties representing the workers and the poor peasantry on the one part, and the Small Landowners representing the more well-to-do peasants and the citizens on the other. The recurring crises were, for a time, eased by compromises, but a final settlement was constantly postponed. The greater part of the former followers of the Horthy system joined the party of Small Landowners. (See also Rumania; World War II.) (M. Ki.)

Hurley, Patrick Jay

Hurley (1883-), U.S. lawyer, diplomat and army officer, was born Jan. 8, 1883, in the Choctaw nation, Indian territory (later the state of Oklahoma). He took his law degree from the National University law school in Washington in 1908 and began practice in that year at Tulsa, Okla. From 1912 to 1917 he was national attorney for the Choctaws, settling their claims with the U.S. government. After serving in World War I and reaching the grade of lieutenant colonel, he returned to the practice of law. He was influential in having Herbert Hoover nominated for president in 1928, and served as secretary of war during Hoover's term of office. A month after the Pearl Harbor attack, he was promoted to brigadier general and was assigned to the far eastern theatre of operations, where he was put in charge of running supplies through the Japanese blockade to the defenders of Bataan. He was President Roosevelt's special representative to the soviet union in Nov.-Dec. 1942, and in March 1943 was named special representative to the near and middle east. Promoted to the rank of major general in Dec. 1943, Hurley was appointed ambassador to China in Dec. 1944. He sided with the Chungking government in its factional struggle with the Chinese Communists. When he announced his resignation on Nov. 27, 1945, he charged that career diplomats of the state department were sabotaging U.S. foreign policy in China by siding with the Communists and by excluding the United States economically.

Husseini, Haj Amin el

Husseini (1900?—), Arab religious leader, politician and grand mufti of Jerusalem, was educated at the

El Azhar university in Cairo, where he was profoundly influenced by the teachings of the rector, Sheik Mustapha el Maraghi, celebrated Arab scholar and archpriest of Arab nationalism. During World War I, he served with Feisal at Damascus and saw action in Palestine. After the Balfour declaration, the mufti joined Arab nationalists in protest against establishment of the Jewish national homeland. He participated in the anti-Jewish disturbances at Jerusalem in 1920 and then fled to Trans-Jordan to avoid serving a prison sentence. Returning under amnesty, he was appointed by the British in 1921 as grand mufti. The following year, he was elected to the Supreme Moslem council.

The grand mufti participated in and encouraged the Arab attacks on Jews in 1937. The police took him into custody in July but the mufti "escaped" and later fled to the Lebanese republic, where he was given asylum. When the French were about to arrest him, he slipped through police cordons and fled to Iraq after the outbreak of World War II in 1939. In Iraq, he played a prominent role in engineering the pro-axis revolt of 1941. After the collapse of this rebellion, Husseini fled to Rome and Berlin.

Arriving in the reich in 1941, the mufti met Hitler and Ribbentrop. He was authorized to broadcast over axis radio channels anti-British and anti-Jewish propaganda to the middle east and helped recruit Moslem units for the German S.S. (Elite Guard) troops.

He also was charged with having urged axis leaders to send their Jewish citizens, not to Palestine, but to Poland for extermination.

He fled to Switzerland after the German collapse in May 1945, but in compliance with the Allied directives against harbouring war criminals, the Swiss deported the mufti to France, where he was placed under house arrest in a villa outside Paris. French officials declared on May 8, 1946, that they would see that he did not leave for the middle east. On June 10, however, the French disclosed that the mufti had "escaped" from their custody; ten days later it was disclosed that he had arrived in Egypt, where he was given sanctuary by King Farouk. Both the British and French governments were accused of complicity in the mufti's escape, although official spokesmen of these countries denied the charges.

Shortly after his arrival in Egypt, Husseini was made spiritual head of a newly-formed Palestine committee created by the Arab league. Jerusalem dispatches dated Sept. 30, 1946, said the mufti had been made head of a secret "shadow government" for Palestine.

Hutchins, Robert Maynard

), U.S. educator, was born Jan. Hutchins (1899-17, 1899, in Brooklyn, N.Y. His father, William James Hutchins, minister and theologian, was subsequently president of Berea college, Berea, Ky. Hutchins left Oberlin college, Oberlin, O., in 1917 to enlist in the U.S. ambulance corps, winning the Croce di Guerra in action with the Italian army. Entering Yale in 1919, he received his A.B. in 1921 and his LL. B. (magna cum laude) in 1925, subsequently receiving honorary degrees from many colleges and universities. In 1923 he was appointed secretary of Yale university and in 1927 dean of its law school. In 1929, at the age of 30, he became the fifth president of the University of Chicago, where his reforms, and proposals for reform, made him one of the best-known and most controversial figures in the history of American education.

From 1937 to 1946 he emerged as a leading figure in the prewar and postwar debate over the role of the United

States in world affairs. Opposing the "steps short of war" policy prior to Pearl Harbor, he argued, in speeches and articles, that the U.S. was "morally unprepared" and that its participation in the war, even if it ended in victory, would diminish rather than increase the strength of democracy both at home and abroad. Calling for the extension of liberal domestic reforms to provide "light and leading to a suffering world," Hutchins never allied himself with any political or extra-political group, asserting, in one of his 1941 speeches, "I am not a member of the America First Committee. I should like to join a committee for Humanity First."

Throughout World War II the University of Chicago was a major centre of military training and governmentsponsored research. When, with the defeat of Japan, it was revealed that the university, under Hutchins' administration, had played a central role in the development of the atomic bomb, Hutchins declared in a radio broadcast that "with the dropping of the bomb, the United States lost its moral prestige." He then began a campaign, in speeches and writings, for international civilian control of atomic energy and against peacetime military conscription. Calling for immediate world organization and the abandonment of national sovereignty as the only hope of saving civilization from atomic destruction, he accepted the chairmanship of the Committee to Frame a World Constitution. In order to devote more time to writing and speaking, he resigned as president of the university and assumed the post of chancellor.

In 1946 he took a year's leave of absence from the university to be chairman of the board of editors of Encyclopædia Britannica, Inc. Announcing his intention to devote himself to the spread of adult education through the reading and discussion of the "great books," Hutchins declared: "If there is a choice to be made between youth and adult education, then the urgency of our time gives priority to the adult."

Besides editing a set of the "great books" to be published by Encyclopædia Britannica in 1948, Hutchins, during the decade beginning in 1937, extended and consolidated his educational reforms at Chicago. In 1937, the law school was reorganized in the direction of a fundamental, rather than a vocational, curriculum. In the same year, Chicago's college plan went into effect, offering a four-year liberal arts program beginning with the usual junior year of high school, and in 1942 the university decided to award the bachelor's degree for this program and to substitute a battery of placement tests for the high school credit system as the basis of admission to the college. Chicago's withdrawal from intercollegiate football preceded by several years the general wartime deflation of college athletics.

In addition to papers in learned journals, articles in popular magazines, and platform and radio addresses, Hutchins continued to teach an undergraduate "great books" course during the decade and wrote Education for Freedom (1943). His earlier books, No Friendly Voice and The Higher Learning in America were published in 1936.

(M. S. Mr.)

Hyde, Douglas

Dr. Hyde (1860—), first president of Eire, historian and poet, was born at Frenchpark, Co. Roscommon, of which his father was Anglican rector. He was professor of modern Irish in the National university from 1909 to 1932. With the possible exception of W. B. Yeats, Dr. Hyde was most responsible for the revival of Gaelic.

Many of his poems, plays, retellings of old legends, etc., were published under his pseudonym, An Craoibhin Aoibhinn ("the delightful little branch," i.e. Ireland). Some months before the promulgation of Eire's new constitution in Dec. 1937, Dr. Hyde, a lifelong Protestant, had been suggested as a nonparty candidate for the presidency. With the support of both Eamon de Valera and William Thomas Cosgrave, leaders of the rival parties, Dr. Hyde was unanimously elected president on May 4, 1938, and was officially installed in office on June 25 of that year. He did not seek re-election when his term expired in June 1945 and was succeeded in office by Seán T. O'Kelly.

Hymans, Paul

Hymans (1865–1941), Belgian statesman, was born March 23, 1865, at Ixelles, Brussels. The son of a prominent member of the Belgian Royal academy, and a successful barrister in his own right, Hymans was appointed minister of state on the date that Belgium received the German ultimatum in 1914. He was one of the three ministers to draft his government's reply to the Germans. He served as minister of foreign affairs from 1918 to 1920, 1924 to 1925, 1927 to 1934 and from Nov. 1934 to March 1935, serving thereafter as minister without portfolio.

He died in Nice, France, March 8, 1941.

lbn-Sa'ud

King Ibn-Sa'ud of Saudi Arabia (c. 1880—), was born in Riyadh, the son of 'Abd-al-Rahmān, leader of the Wahhabi sect of Arabs. Ibn-Sa'ud was christened 'Abd-al-'Azīz Ibn-'Abd-al Rahmān Ibn-Faisal Ibn-Sa'ud, but became generally known by the shorter title. After suffering defeat at the hands of Ibn-Rashīd, 'Abd-al-Rahmān, father of Ibn-Sa'ud, went into exile in Kuwait.

In 1901 Ibn-Sa'ud launched his campaign to regain his father's throne. He soon captured Riyadh, his birthplace, proclaimed himself ruler of Nejd, and began to extend his authority over the outlying provinces; by 1914 he had become a potent influence in Arabic affairs. After the outbreak of World War I, Ibn-Sa'ud threw in his lot with the Allies. Circumstances favoured this union because the Turks supported his dynastic rival, Ibn-Rashīd. Although Ibn-Sa'ud engaged in some desultory military operations against the Turks, he was more concerned over domestic rivalries than over the war.

Immediately upon conclusion of the war, Ibn-Sa'ud undertook a new campaign of conquest. He invaded the Hejaz in 1924, defeated King Husain and entered Mecca. On Jan. 8, 1926, Ibn-Sa'ud was proclaimed king of Hejaz; a year later he converted his title of sultan over Nejd to king of the area. In 1932 his kingdom and dependencies were renamed "The kingdom of Saudi Arabia."

During World War II, Ibn-Sa'ud was neutral, although he favoured the British. Toward the close of the conflict, he joined the controversy over establishment of a Jewish homeland in Palestine on the side of the pan-Arabs; he expressed his views on the topic when he visited President Roosevelt on board a U.S. battleship anchored off the Suez canal in Feb. 1945. He journeyed to Cairo, Egypt, in Jan. 1946 for a conference with King Farouk, and the two monarchs jointly declared that "Palestine must remain an Arab country."

Ibn-Sa'ud criticized President Truman's appeal for admission of more Jewish immigrants to Palestine and declared in a letter to the president Oct. 17, 1946, that his statement was in "complete contradiction" to a presidential assurance to the Arabs and "violated" previous promises made to them.

Ice Cream

The production of ice cream in the United States rose steadily from 1937, when the total output reached 280,-901,000 gal., until 1943, when there was a slight recession before another record of 444,277,000 gal. was made in 1944. This increase was due to the lower restrictions on butterfat and total solids. The use of milk-solids in ice cream was limited in 1942, to 75% of the amount used in the base period (Dec. 1941–Nov. 1942) compared with 65% in 1944. Production increased again in 1945 to a new record and in the first half of 1946 the increase was at a much more rapid rate, reaching an annual production of more than 740,-000,000 gal. in 1946. The release of restrictions on milk-solids was favourable to larger production, but the shortage of sugar was a retarding factor.

Production of Ice Cream in United States, 1937-46

(in gailons)																
1937								280,901,000	1942							464,146,000
								281,939,000								411,626,000
								304,522,000								444,277,000
								318,088,000								475,009,000
1941	٠	٠	٠	٠	٠	٠	•	390,175,000	1946	•	٠		٠	٠	٠	740,470,000

The demand for ice cream, far above the supply throughout the war period, was stimulated by the strong buying power of consumers and the changed practices of eating lunches in war plants. The quick-lunch trade was limited by the distributors. The limitations on the sale of cream restricted home freezing. The prewar average per capita consumption was about 10 lb., which had been reached by steady expansion from about 5 lb. per capita in 1933. Consumption was about 16 lb. per capita in 1942, and nearly 18 lb. in 1946. When the restrictions on ice-cream making were imposed in 1943 the production of sherbet jumped at once from 8,772,000 gal. in 1942 to 47,218,000 gal. in 1943 and 49,481,000 gal. in 1944.

Sherbet production then dropped as restrictions on ice cream were removed. Other frozen milk products, developed to meet the shortage of ice cream, became less important in 1946.

The high level of ice cream consumption was expected to continue in the postwar period so long as consumers' incomes were relatively high.

(J. C. Ms.)

BIBLIOGRAPHY.—For statistics of consumption see U.S. Dept. Agri., Agricultural Statistics; Ice Cream Trade Journal (mo.).

Ice Hockey

Ice hockey, along with ice shows and other forms of entertainment on ice, grew tremendously from 1937 to 1946. Attendance in the National Hockey league, the game's major professional circuit, almost doubled; in 1945–46, more than 2,000,000 witnessed 150 league games.

The Boston Bruins dominated the National Hockey league prior to World War II, winning four successive titles from 1938 to 1941. The Montreal Canadiens, drawing from a population where armed service was not mandatory, came to the fore during and after the war, winning the National Hockey league title from 1943 to 1946.

The Stanley cup, emblematic of world hockey supremacy, was passed among the six National Hockey League cities during the ten-year span—Montreal, Que., Toronto, Ont., Detroit, Mich. and Boston, Mass., each winning it twice, and Chicago, Ill., and New York city capturing it once each. Buffalo, N.Y., and Cleveland, O., dominated the American league; teams from Quebec and Ontario captured five out of nine Allan cups, while skaters from Winnipeg, Man., won four out of ten Memorial cups.

Eight teams composed the National Hockey league in 1937. The Montreal Maroons withdrew in 1938, and the league dropped to six teams in 1942, when the Brooklyn Americans, formerly the New York Americans, retired. Chicago proved a pivotal point of the game as far as gate receipts were concerned, attracting a record 419,924 for 25 home games during 1946 and a single-game crowd of 18,475, largest in hockey history.

Numerous outstanding players were developed during the decade. Eddie Shore, the great Boston defense man, wound up his colourful career in the early years of the era. Two of the finest goal tenders of all time, William Durnan of Montreal and Frank Brimsek of Boston, stood out during the period. The Canadiens offered one of the game's fastest forward lines in Elmer Lach, Maurice Richard and Toe Blake, while the Chicago Black Hawks had an exceptional brother team in Max and Doug Bentley.

Chronology of the Game.—In 1937, the Detroit Red Wings won both the National Hockey league championship and the Stanley cup play-offs, defeating the New York Rangers three games to two in the cup finals. Although the Amateur Athletic union executive committee disqualified teams in the Eastern Amateur Hockey league from the national championships, the tournament was held as a four-team event and was won by the Boston Olympics.

The Chicago Black Hawks led professional hockey in 1938, capturing the coveted Stanley cup in a best four out of seven match play-off with Toronto. Boston finished first in the National Hockey league race, but was beaten in the play-offs for the Stanley cup. A world's amateur hockey championship was conducted in Prague, Czechoslovakia, in 1938, with eight countries represented: Canada won the title. The National A.A.U. championship again was won by the Boston Olympics, an 8–0 victor over the Brock-Hall Hockey club in the final. The American Hockey league championships went to Providence, R.I., in the east and Cleveland, O., in the west.

In 1939, Boston's Bruins dominated professional hockey by winning both the National league championship and the Stanley cup. The Bruins defeated the New York Rangers in the cup finals. Philadelphia, Pa., in the east and the Hershey, Pa., Bears in the west topped the American Hockey league. St. Louis, Mo., won the American association title, with Portland, Ore., the champion of the Pacific Coast league. The Cleveland American Legion defeated the University of Minnesota Gophers in the final of the A.A.U. championship of 1939.

Although Boston won its second straight National league championship the following year, the New York Rangers annexed the Stanley cup in the post-season play-offs. The Rangers defeated the Toronto Maple Leafs in the final. The American league titles went to Providence, R.I., in

Decisive game of the Stanley Cup series April 12, 1938, at Chicago stadium. The Chicago Black Hawks won the championship with a score of 4–1 against the Toronto Maple Leafs

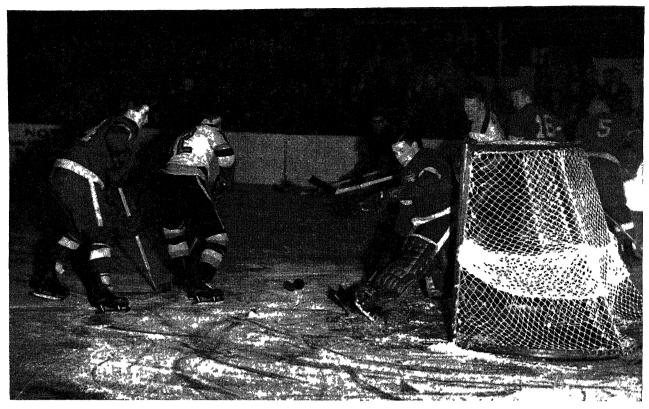

the east and Indianapolis, Ind., in the west. St. Louis repeated as winner of the American association title, while Vancouver, B.C., won the Pacific coast crown. The National A.A.U. championship of 1940 went to the University of Minnesota, Minneapolis, with a final victory over the Brock-Hall team. The Baltimore Orioles won the Eastern Amateur Hockey league title, while the New York Rovers captured the Hershey Challenge trophy. The Allan cup, emblematic of the amateur championship of Canada, was won by the Blue Devils of Kirkland Lake, Ont., with three straight victories over Calgary, Alta., in the finals.

In 1941, the Boston Bruins again won both the National league championship and Stanley cup, defeating Toronto in the trophy play-off. The Washington, D.C., Eagles won the Eastern league title, while Cleveland dominated the American league race. St. Louis once again topped the American association. The St. Nicholas Hockey club won the A.A.U. championships, while the Regina Rangers won the Allan trophy.

The New York Rangers won the National league championship of 1942, but could go no further than the semifinals of the Stanley cup play-offs. The Toronto Maple Leafs captured the cup by defeating the Rangers and then the Detroit Red Wings. Toronto lost its first three matches to Detroit, then won four straight for the world championship. Indianapolis, Ind., defeated Hershey, Pa., three matches to two, in the American league play-off. Omaha, Neb., won the American association championship; the Eastern league title was won by the New York Rovers.

Although the U.S. entrance into World War II affected amateur hockey, most of the important championships had been decided. Boston college won the A.A.U. tournament; the Royal Canadian air force won the Allan cup, while Portage La Prairie, Man., won the Canadian Junior championship. Defense man Tom Anderson of the Brooklyn Americans was judged the most valuable player in the National league, while Frank Brimsek of Boston led the league's goalies.

The Detroit Red Wings completely dominated major professional hockey during 1943, first winning the Na-

off victory with four straight triumphs over the Boston Bruins. John Mowers, winner of the Vezina trophy as the league's outstanding goalie, held Boston scoreless in two of the four final cup matches. Buffalo, N.Y., won the American league championship in 1943. The Eastern Amateur league crown went to the Curtis Bay Coast Guard Cutters. The Ottawa Commandos captured the Allan cup, while Dartmouth was unbeaten in U.S. collegiate competition.

tional league title and then going on to a Stanley cup play-

Bill Cowley of Boston was voted the most valuable player in the National league in 1943, and Doug Bentley of Chicago tied the league scoring record with 73 points.

In 1944, the Canadiens of Montreal reigned completely supreme over the National Hockey league, winning 46 games, tying 5 and losing only 6 in league and Stanley cup campaigns. The Canadiens won eight out of nine play-off matches against Toronto and Chicago. Montreal was unbeaten in 25 home games during 1944. Buffalo, N.Y., retained the American league championship in 1944 with play-off victories over Indianapolis, Ind., and Cleveland, O. The Boston Olympics dominated the Eastern Amateur league with 11 victories and only 1 defeat. The Quebec Aces won the Allan trophy. Walter "Babe" Pratt, Toronto defense man, was judged the most valuable player in the National Hockey league, while William Durnan of Montreal topped the league goalies by holding his opposition to 100 goals.

Canada continued to dominate wartime hockey in 1945, Montreal winning the National league championship and Toronto capturing the Stanley cup. After finishing third in the league race, Toronto defeated Montreal, four matches to two, in the semifinal play-offs and went on to stop Detroit, Mich., in the final series. The Stanley cup windup went the maximum seven games, with Toronto winning the deciding contest, two to one. Minor league hockey in 1945 was again restricted to the American

Opening contest for the 1946 Stanley cup between Detroit's Red Wings and the Boston Bruins, won 3-1 by Boston. The Boston Bruin team lost the cup in the play-off finals to the Montreal Canadiens

league, with Cleveland, O., winning the championship in play-offs with Buffalo, N.Y., and Hershey, Pa. The Seattle Ironmen won the U.S. amateur title in the finals against the Boston Olympics, four games to two. Seattle won the Pacific Coast league campaign, while the Olympics dominated the Eastern league. Elmer Lach, Montreal, was voted the most valuable player in the National league, while the Canadiens' William Durnan repeated as the outstanding goalie.

Reverting to their all-around supremacy of 1944, the Canadiens of Montreal won both the National Hockey league championship and Stanley cup in 1946. Montreal won eight out of nine play-off games to capture the Stan-

The Buffalo, N.Y., Bisons won the American league title for the third time in four years, defeating Cleveland, O., four games to three, in the final play-off. Kansas City, Mo., won the United States league championship. The Boston Olympics won the Eastern league race, but lost to Vancouver, B.C., Pacific coast league champions, in the Amateur Hockey association play-off. Max Bentley of Chicago was voted the league's most valuable player, while Bill Durnan won his third straight Vezina trophy as hockey's leading (M. P. W.)

Iceland

An island republic of the North Atlantic, Iceland has an area of 39,709 sq.mi.; its population in 1939 was estimated at 120,264. Capital, Reykjavik, the only large town

(pop. 1939, 38,219). Religion, Lutheran Christian. Hereditarily united with Denmark, Iceland became an independent state Dec. 1, 1918, legally united with Denmark only by recognition of a common king. After April 9, 1940, the executive power was wielded by the Icelandic ministry, headed by a regent (Sveinn Bjornsson, after May 17, 1941). At first the coalition cabinet had no chief minister; after the fall of 1941 Hermann Jonasson so acted; he was succeeded by Olafur Thor in May 1942; Dr. Bjorn Thordarson became chief minister in a nonpartisan government on Dec. 16, 1942. Olafur Thor formed a coalition government with a six man cabinet-two each from Conservative, Social-Democratic and Communist parties, on Oct. 21, 1944. Sveinn Björnsson became president for one year on June 17, 1944, and was later re-elected for the additional regular four year term ending in 1949.

Independence.—For more than 300 years after establishing its constitution in A.D. 930, Iceland had been vigorously independent. Internal strife brought evil days and an agreement to unite with Norway for the sake of order. It was an agreement subject to cancellation by the free men of Iceland if the king of Norway should break it; but it lasted, and in 1280 Iceland as well as Norway became united with Denmark. Under changing conditions that association lasted down to World War II. In the 19th century Jón Sigurdsson and others led a long fight for Icelandic independence. Jón Sigurdsson emphasized Iceland's historic right to independence and insisted upon the revival of the power of the Althing, the famous legislative body of the country, oldest parliament in the world. The Althing was re-established in 1843, and home rule was granted Iceland in 1903. The next step forward was taken on Dec. 1, 1918, after the end of World War I, with the Danish-Icelandic Act of Union:

Denmark and Iceland shall be free and sovereign states united under a common King, and by the agreement contained in this Law of Union; the names of both states shall be indicated in the King's title.

Denmark was to handle Iceland's foreign affairs as its attorney, but otherwise the island state was almost completely independent, creating its own supreme court and gradually taking over control of fisheries inspection and other aspects of administration.

The Act of Union provided for its own possible termi-

Record gale off the shores of Iceland in Jan. 1942 all but swamped this U.S. navy supply ship dragging its anchor along the coast nation at the end of 25 years. The process was to be complex, requiring first three years of negotiations, then a two-thirds vote in each house of the Danish Rigsdag and in the Althing, and confirmation by a three-fourths majority of the voters in an election in which at least three-fourths of the eligible voters participated. But the Icelanders were not stopped by the complexities, and war made it all easy. The political parties in the Althing had declared for complete independence in 1928; in 1937 the Althing instructed the government to prepare for the independent handling of foreign affairs.

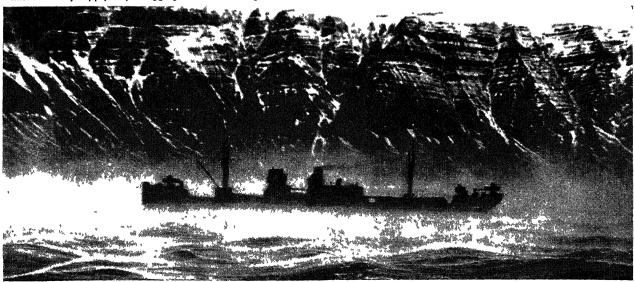

When Denmark was invaded by the Germans on April 9, 1940, the Icelanders were forced to take some kind of action. On April 10 the Althing vested executive power in the cabinet, because the king of Denmark could not act; and it resolved to take over the conduct of foreign affairs. The next step was taken on May 17, 1941, with passage by the Althing of three resolutions:

(1) The Althing resolves to declare that Iceland has acquired the right to abolish entirely the Act of Union with Denmark, since Iceland has had to take into its own hands the conduct of all of its affairs, and since Denmark is not in a position to attend to the matters on behalf of Iceland which were agreed to under the Danish-Icelandic Act of Union of 1918. On the part of Iceland there shall be no question of renewing the Act of Union with Denmark, although it is not thought expedient in the present circumstances to effect the formal abolition of the Union, nor to establish the final constitution of the State, but these will not be postponed beyond the end of the war.

(2) The Althing resolves to appoint a regent, for a period of one year (term of office subsequently extended) to wield Supreme Power in matters of state which were placed in the hands of the Cabinet on April 10, 1940.

(3) The Althing resolves to announce its will that a republic be established in Iceland as soon as the Union with Denmark has been formally dissolved.

Sveinn Björnsson, longtime Icelandic minister in Copenhagen, was chosen regent, and on May 20, 1941, Iceland served on Denmark formal notice of her desire to end the union. On Feb. 25, 1944, the Althing again resolved to end the union, subject to approval by the electorate. In the plebiscite of May 20–23, 1944, more than 98% of the citizens voted, including Icelanders abroad who rushed to their consulates to record themselves. On the abrogation of the union 71,122 voted yes, 377 no. Then by a vote of 69,435 to 1,051, the republican constitution adopted by the

Althing was accepted. The republic of Iceland was proclaimed June 17, 1944, the birthday of Jón Sigurdsson, and a tremendous national celebration greeted the event on the ancient field of the parliament meetings—Thingvellir. In New York City, N.Y., 270 Icelanders and their descendants gathered to celebrate the great event.

Denmark, still under the heels of the nazis, was hardly in a mood to celebrate an event such as the breaking away of Iceland. But on June 17, King Christian X sent a telegram of acceptance and good wishes to the Icelanders, and their cup of happiness was full as they sang the Danish royal anthem as friends but not as subjects.

The union of Denmark and Iceland would doubtless have ended in due course in some fashion; unquestionably World War II, which overwhelmed Denmark and thrust Iceland into new complexities, both simplified and speeded the process of independence.

Role in World War II.—Iceland, an innocent bystander in the rivalries of diplomacy and war, had always been far enough from the centre of strife to avoid involvement, until World War II. Then the position was changed. Mass armies, air armadas and critical supply routes made weather reporting more vital than ever, and Iceland was a significant point for such reports. The position of the Germans in Norway revolutionized the North Atlantic strategic situation, and made Iceland a bulwark on Britain's flank, as well as a potential base for naval or air operations in the Atlantic. After the U.S.S.R. had been drawn into the war, Iceland became a crucial position on the long and dangerous convoy route to Murmansk. And the island was, most important of all, the natural half-way point on the North Atlantic run between the U.S. and Great Britain. Geography had once isolated it; geography now, under changed conditions, drew it into the vortex of trouble.

The British foresaw some of the future importance of the island, and realized that after the occupation of Denmark and Norway by Germany, it would be natural for the Germans to try to establish their position in Iceland too. Hence, on May 10, 1940, British troops landed in Iceland, and a force of 60,000–80,000 was maintained there in order to keep the Germans from using it as a base for offensive action.

The British did not interfere with the government or freedom of speech, and the Icelanders while none too friendly, tried to believe that the British soldiers would evacuate as soon as the war ended. The occupation created social problems among a people only twice as numerous as the garrison itself, but it also stimulated business. Icelandic ships continued to operate, and the country sold its entire output of herring meal and herring oil, and the catch of cod, to Great Britain.

The U.S. "Occupation."—Early in July 1941, United States marines landed on the island, to be re-enforced later by more U.S. troops in unknown number. The step was taken after consultations between the British and United States governments, and a direct exchange of messages between Pres. F. D. Roosevelt and Prime Minister Hermann Jónasson of Iceland. Jónasson set up eight conditions for the admission of U.S. forces, and Roosevelt accepted them. Chiefly they were: recognition of Icelandic independence and sovereignty both at the time of occupation and after the war; organization of defense with sufficient force and matériel, and by picked men; arrangements to assure Iceland's markets and supplies.

The prime minister's message stipulated that "The U.S.

promises to withdraw all their military forces, land, air, and sea, from Iceland immediately on conclusion of present war." Pres. Roosevelt in his reply carefully repeated verbatim all the other stipulations, but to this one added his own phrasing. "That immediately upon the termination of the present international emergency, all such military and naval forces will be at once withdrawn, leaving the people of Iceland and their government in full sovereign control of their own territory." Roosevelt envisioned the possibility of just what happened; that the end of war would not end the "international emergency." But here were seeds for misunderstanding.

British forces were diminished as the U.S. troops arrived, and were withdrawn entirely by the autumn of 1942 Relief of the British and closer guarding by the United States of its sea lanes were the primary reasons for the move. The question remained undetermined whether Iceland belonged in the western hemisphere or the eastern By August the U.S. troops were comfortably established in heated corrugated iron huts, with ample supplies of clothing and food.

The threat from Germany was dramatized in Aug. 1941, when a nazi bomber appeared, and many times later as damaged merchant naval vessels limped into the harbour of Reykjavik. Despite the obvious danger, and despite a favourable commercial agreement with the United States reached in Aug. 1941, people were discontented with conditions, especially with rising living costs. Disputes increased, and in October the ministry resigned. Nine days later (Oct. 31) it returned to office after an appeal from the regent. War and military occupation disturbed the price balance profoundly. In Reykjavik the cost of living index soared (using Jan.-March 1939 as 100) from 146 in Jan. 1941 to 183 in Jan. 1942, and up to 272 in Sept 1942. But the country began to increase its imports, and the price line did not get completely out of hand. The index was down to 259 in Nov. 1943, but up again to 285 in the spring of 1946. An important factor was that wages rose automatically each month on the basis of the official index of prices published by the bureau of statistics. This aroused political controversy and the proposal to reduce the compensatory rise to 80% of the index.

Relations between the occupying troops and the people of Iceland were in general very friendly. The British and U.S. generals were evidently able administrators-Gen. Henry Osborn Curtis of Great Britain was replaced in command of the U.S. and British forces in April 1942 by Maj. Gen. Charles H. Bonesteel of the U.S.; he in turn was replaced by Gen. William S. Key (U.S.) in June 1943, and Gen. Early E. W. Duncan (U.S.) took command in Dec. 1944. It was Gen. Key particularly who revised the policy of segregation of troops and civilians and through lectures on Iceland to the troops and by other means developed a more sympathetic mutual understanding. A few tragic incidents had occurred, such as the shooting in the back of an Icelandic boy by a U.S. soldier. More numerous were the evidences of good feeling such as the marriages between U.S. soldiers and Icelandic girls.

In many ways the bystander got hurt. Nazi planes sank many Icelandic fishing vessels, and finally its two important passenger ships, the "Godafoss" and the "Dettifoss," leaving the country dependent on U.S. planes for travel between Iceland and U.S.

Iceland's economic activities were affected by other things than war. Refrigeration, for example, practically stopped the export of salt fish, and the great product became frozen fish. At the close of World War II, Great Britain, Iceland's best customer, announced that it would

Snow-covered street in the camp of the U.S. Iceland Base command

need none of Iceland's fish in 1946, and the Icelanders hurriedly sought markets in central Europe and the U.S. During the war Great Britain had continued to buy most of Iceland's output, but Iceland purchased its imports increasingly from the U.S. War co-operation brought an arrangement by which the U.S. paid for Britain's purchases with U.S. dollars, but such a policy could not continue. Iceland looked hopefully to Russia as a future market, and in May 1946 signed a trade treaty with the U.S.S.R.

One of the great events of the wartime period was the completion in 1945 of the great project of heating the homes of Reykjavik by water piped in from the hot springs some 12 miles away. Some of the work had been completed when war broke out, and the materials for much of the rest lay ready to ship in Denmark. Despite British and German pledges of free passage, one vexatious delay piled on top of another. Substitute piping was bought in the U.S., and then the ship bringing it was torpedoed. But at last the job was done, especially important for Iceland because of its long heating season and the fact that all coal had to be imported. Furthermore, the water piped in was medicinally useful for baths, and valuable for greenhouse use-even bananas could be raised with its aid. New hydroelectric plants were built with equipment from the U.S.

Other Wartime Events.—During the war the roads of Iceland were greatly improved, and a considerable amount of building was completed. Millions of dollars were set aside for postwar replacement of fishing vessels; 55 motor fishing ships were ordered in Sweden, 20 steam trawlers in England, 30 schooners in Iceland; larger ships were contracted for in Denmark and England.

The Roman Catholic Church in 1943 appointed Jóhannes Gunnarsson bishop of Iceland—the second Catholic

bishop after Lutheranism became the state religion in 1550.

A careful work of mapping the entire island, begun in 1900, was completed in Copenhagen during World War II. All of Iceland was accurately and beautifully mapped on a scale of 1:100,000.

Art enjoyed a boom in Iceland, and literary production increased especially because of the wartime cutting off of other Scandinavian literature. A choice of the Book of the Month club in the U.S. was an Icelandic novel, Halldór Laxness' Independent People. Perhaps the most important work in the country during the period was Prof. Sigurdur Nordal's Islenzh menning (The Culture of Iceland).

The people of Iceland had always taken their politics very seriously, but there was little shifting in the power of the parties during the decade. In the elections of June 1946, the opposition Progressives lost two seats to the Social Democrats, a government party, but otherwise the balance remained as it had been. The new voting strength and position in the Althing was as follows: Independence party, 26,428 votes, 20 seats; Progressives, 15,072 votes, 13 seats; Communists, 13,049 votes, 10 seats; Social Democrats, 11,911 votes, 9 seats.

Postwar International Relations.-Iceland was not invited to the San Francisco conference because it had not declared war on Germany or Japan. Actually there had been acts of war against Iceland by Germany, but Iceland valued the permanent neutrality it had declared in 1918, and would do nothing to weaken its legal position. Iceland did participate in some of the other international conferences such as Bretton Woods and the air conference in Chicago, Ill., where it had four delegates. In the latter conference, its position had real importance, and it was this position with relation to air routes which led to the later complications of the country in world affairs. When Iceland became independent, Sweden particularly feared that it meant withdrawal from Scandinavian ties of culture and trade. But the Icelanders emphasized that they valued and intended to continue their Scandinavian connections, while at the same time playing an independent role in the family of nations. Iceland joined the International Labour organization. Iceland also entered into special trade agreements with Sweden, the U.S., and other countries. On July 26, 1946, Iceland voted to apply for admission to the United Nations, and was one of the states approved by unanimous vote of the Security council on Aug. 29.

The great problem of 1946 was the use of Iceland's U.S. built airfields. Rumours had floated about for months, and protests against U.S. "imperialism" in Iceland had come out of Moscow. On April 26, 1946, it was announced in Iceland that on Oct. 1, 1945, the U.S. had asked to open negotiations with the Icelandic government regarding future bases. Icelandic officials discussed the proposal, but averred that they were not ready to negotiate. Hence the matter had been dropped for some months. In 1946 talks were undertaken and an agreement was reached; the U.S. would be allowed to use Keflavík áirfield until the end of the occupation of Germany; the U.S. would leave some operating personnel at the fields, but withdraw its naval and military occupying forces.

In Sept. 1946 when this agreement came up for discussion in the Althing, hot debate ensued. The Communists, who for nearly two years had co-operated in the cabinet, threatened to leave if the agreement was ratified. Conserva-

tive and Social Democratic organs expressed approval, feeling that essential control would be in the hands of Icelanders anyway. The Communist paper said that the agreement would make Keflavík a camouflaged base for the U.S. A mob of some 200 people attacked the mayor of Reykjavik, Bjarni Benediktsson, as he was leaving a meeting where Conservative party leaders had spoken in favour of the agreement. Prime Minister Thors, who had made a speech, had a police escort from the hall. The police urged the mob to disperse, but there was no movement until a Labour spokesman announced plans for a general strike in protest against the treaty. The strike, under the leadership of the Federation of Icelandic Trade Unions, began at noon on Sept. 23, to last 24 hours. At a Communist outdoor meeting the air base agreement was called "a surrender of Icelandic

11941

In Washington the state department announced that an agreement had been signed whereby U.S. troops would depart from Iceland within 180 days, leaving only civilian personnel at the Keflavík airport, which was to be used as a transit point for planes to and from Germany. The navy department said it would begin evacuation of its forces on Sept. 23, and the war department stated its readiness to begin removal of army forces as soon as the state department submitted a request.

The strenuous opposition in Iceland was not strong enough to prevent ratification of the agreement, which passed in the Althing on Oct. 5, by a vote of 32-19, despite riots and the threat of the Communists to leave the government. A few days after the vote in the Althing the cabinet split and resigned (Oct. 10, 1946).

Ice Skating

Hampered by World War II and the lack of Olympic game competition, speed and figure skating nonetheless held its place in the sports firmament from 1937 to 1946. Figure skating especially grew in popularity with the introduction of three major and several minor ice shows Such former world and national champions Sonja Henie, Robin Lee, Maribel Y. Vinson and Bobby Specht featured the specialty numbers in

various professional ice shows.

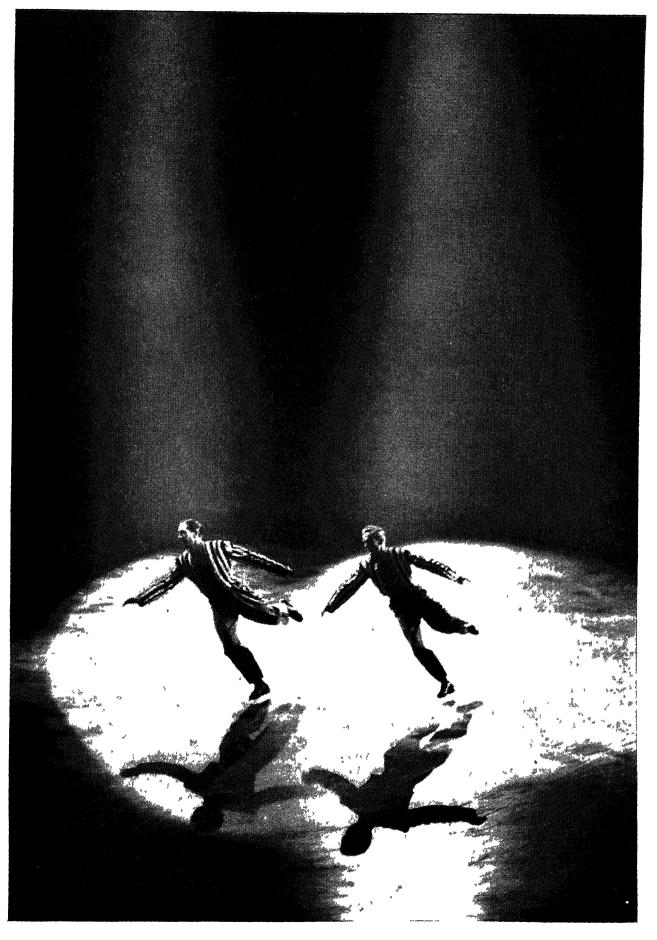

Minneapolis, Minn., and Chicago, Ill., completely dominated the men's national speed skating championships over the ten-year period. Outstanding men's skater of the era was Ken Bartholomew, who won three national championships before entering the army in 1942.

The nationals were cancelled in 1943, 1944 and 1945 because of the war.

Except for a two-year reign by Carmelita Landry of Fitchburg, Mass., the women's national speed skating titles were the legacy of mid-westerners. Madeline Horn of Beaver Dam, Wis., dominated the women's division prior to 1941, while Mrs. Elaine Bogda Gordon of Chicago was returned as champion when the nationals were revived in 1946.

The 1937-46 era in figure skating marked the close of a nine-year championship reign by Maribel Y. Vinson and the supremacy of Joan Tozzer of Minneapolis, Minn, Mrs Jane Vaughan Sullivan of Philadelphia, Pa., and Gretchen Merrill of Boston, Mass. Miss Tozzer won three titles from 1938 to 1940; Mrs. Sullivan captured the 1941 and 1942 championships, and Miss Merrill, a 'teen-aged member of Boston society, won successive championships from 1943 to 1946.

Robin Lee concluded a string of five successive men's national figure skating titles in 1939, turning the championship over to Eugene Turner of Los Angeles, winner in 1940 and 1941 Robert Specht of Chicago and Arthur R. Vaughan Jr. won the next two years, after which the men's national championships were by-passed until Rich-

Robert Fitzgerald of Minneapolis, Minn., (left) who won the North American speed skating championship at "Schenectady, N.Y., on Jan. 27, 1946. He is shown leading in the senior men's three-quarter mile event

ard Button of Philadelphia captured the revival in 1946. England took charge of the women's world figure skating championship upon the retirement from amateur competition of Miss Henie, a ten-time winner up to 1937. Cecilia Colledge brought the title to England in 1937, and Megan Taylor won the championship in 1938 and 1939. No competition was held from 1940 to 1946. The 1937 and 1938 men's world title went to Flex Kaspar of Austria, while Graham Sharp of England won in 1939.

Numerous national records were broken during the decade. Robert Fitzgerald of Minneapolis set a mark of 18.1 sec. for 220 yd. in 1943, and shared the 440-yd. record of 35.4 sec. with Charles Gorman and Bartholomew. Ross Robinson's time of 14 min., 30.4 sec. for the five-mi. event, set in 1937, was the other outdoor record broken during the ten years.

In the women's division, records were established in four of the five distances from 220 yd. to 1 mile. Miss Horn set three of them, setting marks of 20.2 sec. in the 220, 1 min., 25.9 sec. in the 880, and 3 min., 6.1 sec. in the 1 mile. Mrs. Dorothy Franey Drolson of St. Paul, Minn., set a three-quarter mile record of 2 min., 17 sec. in 1937.

The season of 1937 marked the dominance of two veteran skaters in national speed events. Marvin Swanson of Minneapolis won his third straight men's senior title, while Miss Horn won the women's crown. The national figure skating championship, held in Chicago to mark its first appearance away from the Atlantic seaboard, was won by Lee, then 17 years of age, and Miss Vinson.

Vic Ronchetti of Chicago arose for a one-year dominance of men's speed skating in 1938, winning the national and North American outdoor and North American indoor titles. Miss Tozzer started the first year of her three-year championship reign by winning the women's senior figure skating crown. Lee repeated in the men's division.

Bartholomew came into his championship own in 1939

with the first of his three national senior speed titles. Miss Horn was first in both the women's national and North American, with Charles Leighton of Minneapolis winning the men's North American. Both Lee and Miss Tozzer repeated as national figure skating champions, after which Lee turned professional.

Miss Tozzer not only won her third national crown in 1940, but repeated as national pairs champion with Bernard Fox, also of Boston. Eugene Turner of Los Angeles replaced Lee as men's senior champion. Leo Freisinger, a member of the 1936 Olympic games team, won both the national and North American speed trials. Miss Horn also scored a double in the women's phase of the meets.

Bartholomew came back to capture both the national and North American titles in 1941. Halting the long dominance of Miss Horn, Miss Landry won the women's national speed championship. Miss Vaughn, a University of Pennsylvania coed, started a two-year reign as women's national figure skating champion, while Turner repeated as men's titlist.

Bartholomew and Miss Landry dominated speed skating in 1942, each winning national and North American championships. The former Miss Vaughn, having become Mrs. Sullivan, retained her women's national figure skating championship, while the men's crown went to Bobby Specht of Chicago. Specht turned professional after winning the title.

Only one national senior skating championship—the women's figure championship—was contested regularly from 1943 through 1945. All national speed competition was wiped out because of the war, while the national men's figure event was held in 1943 and then cancelled until 1946. Arthur R. Vaughn, Jr., a brother of the former women's champion, won the figure title in 1943. The national women's figure skating crown was wholly in custody of Miss Merrill, who won four straight championships from 1943 to 1946.

The return of national competition brought new champions in all divisions except women's figure skating. Bob Fitzgerald, a 22-year-old air corps veteran, defeated Bartholomew in the men's speed. Mrs. Gordon won the women's speed title, while Richard Button of Philadelphia annexed the men's figure skating crown. (M. P. W.)

Ickes, Harold L.

Ickes (1874—), U.S. statesman, was born March 15, 1874, at Frankstown Township, Pa., and graduated from the University of Chicago in 1897. After spending several years as a Chicago newspaper reporter and engaging in local politics, he set up legal practice in 1907. After assuming office in 1933, President Roosevelt selected Ickes as his secretary of the interior.

In July of the same year Ickes was also appointed head of the Public Works administration. In succeeding years of the New Deal, Ickes held a multitude of other posts; he became solid fuels administrator in Nov. 1941, coal mines administrator in 1943 and petroleum administrator for war in Dec. 1942. Ickes was an ardent New Dealer and opponent of big business. In Feb. 1944, for example, he led a vigorous, although unsuccessful, campaign for the building of an oil pipe line across Arabia, a project which was bitterly opposed by U.S. oil companies. He was also much concerned with his belief that there was no

genuine freedom of the U.S. press which, he charged, was controlled by financial and business interests. As a result of a dispute with President Truman over the appointment of Edwin W. Pauley as undersecretary of the navy, Ickes resigned as interior secretary on Feb. 13, 1946. He then accepted an offer to write a daily column for the New York Post. Among his later publications were: Back to Wolk (1935); New Democracy (1934), America's House of Lords (1939), Freedom of the Press Today (1941), and Autobiography of a Curmudgeon (1943).

Idaho

One of the far northwestern states of the U.S., Idaho was admitted to the union on July 3, 1890; popularly known as the "Gem state." Area, 83,557 sq.mi., pop. (1940) 524,873, of which 66.3% was rural, 33.7% urban. On July 1, 1944, the bureau of the census est. the pop. at 531,573. There were 3,537 Indians in the state in 1940. Principal cities (1940) are Boise, the capital (26,130), Pocatello (18,133), Idaho Falls (15,024), Nampa (12,149) and Twin Falls (11,851).

Principal state officers in 1937 were: governor, Barzilla W. Clark; lieutenant governor, Charles C. Gossett; secretary of state, Ira H. Masters; attorney general, J. W. Taylor; chief justice, Raymond L. Givens; treasurer, Myrtle Enking; auditor, H. A. Parsons; state mining inspector, Arthur Campbell. Sen. William E. Borah was returned to Washington, D.C., for the sixth time, having defeated his opponent by a substantial majority. In the biennial elections of Nov. 1938 a Republican governor and legislature were elected. Idaho's governors had been Democratic from 1932, and after 1934 all governmental branches were controlled by that party. Principal state officers were: governor, C. A. Bottolfsen; lieutenant governor, Donald S. Whitehead; secretary of state, George H. Curtis; attorney general, J. W. Taylor; chief justice, James F. Ailshie; treasurer, Myrtle Enking; auditor, Calvin E. Wright; state mining inspector, Arthur Campbell. D. Worth Clark (Dem.) was elected U.S. senator; Henry Dworshak (Rep.) was elected representative from the second district and Compton I. White (Dem.) from the first district.

The 1939 session of the state legislature, which met from Jan. 2 to March 2, enacted 270 laws. Important measures passed were those authorizing the establishment of civil service tenure for certain nonelective state employees; an automobile driver's financial responsibility law; humanitarian occupational disease measures; reduction of passenger car licence costs to \$5, the loss of revenue to highway districts being compensated for by revenues from the state highway department; appropriation of \$1,000,000 for the equalization of educational opportunity between school districts with adequate funds and those without; and a law providing for the creation of locally-financed junior college districts.

In the presidential election of 1940, Roosevelt received 127,842 votes and Willkie 106,553. In the state elections a Democratic governor and a Democratic legislature were elected, while a Republican, John Thomas, was sent to

the U.S. senate. Compton I. White (Dem.) and Henry Dworshak (Rep.), represented the two congressional districts. Sen. Thomas succeeded Sen. Borah, who died in Jan. 1940. State officers for 1941–42 were: Chase A. Clark, governor; Charles C. Gossett, lieu-

tenant governor; George H. Curtis, secretary of state; Bert H. Miller, attorney general; Calvin E. Wright, state auditor; C. E. Roberts, superintendent of schools; Arthur Campbell, state mining inspector. No general election was held in 1941 and the legislature was not in session.

In the 1942 elections, held Nov. 3, the following state officers were elected: governor, C. A. Bottolfsen; lieutenant governor, Edward Nelson; secretary of state, George H. Curtis; attorney general, Bert H. Miller; auditor, Calvin E. Wright; superintendent of schools, C. E. Roberts; state mining inspector, Arthur Campbell; treasurer, Myrtle Enking. The governor and both houses of the legislature were Republican. The principal subject of controversy in the new legislature, which convened on Jan. 4, 1943, was the old-age pension act adopted in 1942 on an initiative vote. The legislature "repealed" the act and Gov. Bottolfsen approved and signed the repeal. Supporters of the pension immediately began a movement for the recall of the governor and members of legislature who had given their support to the repeal, but no definite action was taken.

Principal state officials elected in the general election of Nov. 1944 were the following: governor, Charles C. Gossett; lieutenant governor, Arnold Williams; secretary of state, Ira H. Masters; attorney general, Frank Langley; auditor, Earnest G. Hansen; superintendent of public instruction, Grover C. Sullivan; treasurer, Ruth Moon; mine inspector, Arthur Campbell. Also elected were Edwin M. Holden and Bert H. Miller, supreme court justices; Glen Taylor, U.S. senator; and Compton I. White, con-

gressman, first district. The above were all Democrats. Henry M. Dworshak (Rep.) was re-elected congressman for the second district, and both houses of the newly-elected legislature were Republican by small majorities, but nationally the state went Democratic. Presidential electors: Democrats 107,399; Republican 100,137. All state offices were carried by Democratic majorities of 4,000 to 12,000.

The legislative body elected in 1944 convened in Jan. 1945. Principal legislation dealt with problems of postwar planning. Upon the death of Sen. Thomas on Nov. 10, 1945, Gov. Gossett resigned and Lieut. Gov. Williams automatically assumed office. Williams immediately appointed Gossett to the U.S. senate to fill the vacancy left by the death of Sen. Thomas.

New state officers elected in Nov. 1946 (all Rep.) were: governor, C. A. Robins; lieutenant governor, Donald S. Whitehead; secretary of state J. D. Price; attorney general, Robert Ailshie; auditor, N. P. Neilson; treasurer, Leila D. Painter; superintendent of public instruction, Elton Jones. Large Republican majorities were elected to both state senate and house.

Illinois

A north central state of the United States, Illinois was admitted to the union in 1818, popularly known as the "Sucker state," or the "Prairie state." Total area, 56,400 sq.mi., of which 55,947 sq.mi. are land. Pop. (1940) 7,897,-241, of which 7,504,202 were white and 393,039 nonwhite. Pop. classed as urban was 5,809,650, rural not on farms 1,119,488, rural farm 968,103. Springfield, the capital and fifth largest city, had a pop. of 75,503 in 1940. Chicago (3,396,808) is the largest Illinois city, followed by Peoria (105,087); Rockford (84,637); East St. Louis (75,609).

The 6oth general assembly, which had a Democratic majority in both houses, convened from Jan.-June 1937. Important measures passed during the session were: an eight-hour law for women workers; a new insurance code; marriage laws requiring a medical examination for both parties and a three-day period between application for and issuance of the licence. A 3% tax on public utility sales was passed to replace one that had been declared unconstitutional, and the 3% sales tax was extended to Feb. 15, 1939, after which it reverted to 2%. Permanent registration of voters, instituted in 1935 for ten cities, was extended to all of Cook county (Chicago). Other legisla-

Night work on the Anderson Ranch dam in Idaho during 1945. Located in the Boise valley, it was to be the world's largest earthfilled dam when completed

tion established machinery for the administration of unemployment insurance and old-age assistance. The life of the Illinois Emergency Relief commission was extended to July 1, 1939. State officers were: Henry Horner, governor; Edward J. Hughes, secretary of state; Edward J. Barrett, auditor; Otto Kerner, attorney general; John Stelle, lieutenant governor; and John C. Martin, treasurer. All these officers were Democrats.

In 1938, two special sessions of the general assembly were called to deal primarily with exhausted relief funds in Chicago, and relief deficits elsewhere. An appropriation of \$4,500,000 was made; funds were provided out of general revenue, after proposals for new taxes were defeated. Additional funds were obtained by continuing the 3% tax on utilities until July 1, 1939, when it became 2%. A driver's licence bill was passed, requiring no immediate examination for applicants, but providing for accident liability. A proposal to call a constitutional convention was defeated.

Gov. Horner was kept from office by ill health during the latter part of 1938 and early part of 1939. His duties were taken over by Lieut. Gov. Stelle. Sen. James Hamilton Lewis died on April 9, 1939, and James M. Slattery was appointed to succeed him pending the Nov. 1940 election. Bills introduced by Sen. Hickman repealing some 400 obsolete laws were passed.

Lieut. Gov. John Stelle assumed the governorship after Gov. Horner's death on Oct. 6, 1940. A critic of the Horner administration, Stelle made numerous replacements of appointive officers, among whom were five directors of administrative departments. In 1940 the heaviest Illinois vote on record (4,262,196) gave a majority to Roosevelt for the presidency (Roosevelt 2,149,943; Willkie 2,047,240), but elected from the Republican roster a U.S. senator, C. Wayland Brooks, to finish the term of the late J. Hamilton Lewis; other Republicans elected were 16 out of 27 congressmen; all state officers with one exception; and a majority in both houses of the general assembly. Based on the 1940 census, Illinois was to lose one seat in congress by federal reapportionment in 1943. New state officers were Dwight H. Green, governor; Hugh W. Cross, lieutenant governor; Edward J. Hughes (Dem.), secretary of state; A. C. Lueder, auditor; Warren Wright, treasurer; George F. Barrett, attorney general. The general assembly

convened in special session on April 30, 1940, its chief accomplishment being to increase old-age pensions to a maximum of \$40 a month. (T. C. PE.; X.)

War and preparation for it overshadowed political life in Illinois in 1941. The year closed with the general assembly in special session to consider new legislation to enable the state to co-operate better with the national government; appropriations of \$16,000,000 were asked for this purpose by Gov. Dwight H. Green. In the previous session of the legislature, 88 of the 650 bills passed were vetoed by the governor. The legislature refused to carry out the constitutional mandate to reapportion the legislative and congressional representation of the state, with the result that representation was still based on the census of 1900. Thus the population of Chicago was underrepresented both at Springfield and Washington. The state sales tax was reduced from three to two cents per dollar and additional taxes were laid on cigarettes, liquor and oil. Women were made eligible for grand jury duty.

Mobilization and production for war dominated the Illinois scene in 1942. The Great Lakes Naval Training station was supplying numerous navy personnel, Camp Grant was one of the largest army receiving centres and Ft. Sheridan an important army headquarters. Chanute field and Scott field were centres of intense and expanding aviation activity. Ordnance facilities at Savanna, Kankakee, Elwood and Marion were all in production, while the historic arsenal at Rock Island was vastly expanded. By Dec. 1, 1942, a total of \$617,475,000 in war bonds had been absorbed by private buyers, and the state's financial institutions had taken billions. Gains were made by the Republican party in the 1942 elections. U.S. Senator C. Wayland Brooks, at the head of the Republican ticket, defeated Raymond S. McKeough, Democrat, for the junior U.S. senatorship. Republicans gained 3 U.S. representatives, electing 19 to 7 Democrats. The entire Republican slate for state offices were elected.

In 1943, more than 800 Illinois plants were engaged in the manufacture

of aircraft and parts. The four great ordnance plants and the tank and artillery plants were near full production; production of landing barges and similar watercraft was increased throughout the year. The state stood sixth in the union in war expenditures. Up to Oct. 1, 1943, supply contracts and capital investments in plant and facilities totalled \$9,015,490,000, excluding subcontracts and prime contracts of less than \$50,000. Of this amount \$1,482,069,-000 was for aircraft; \$197,840,000 for ships and boats; \$2,928,678,000 for ordnance; \$3,140,589 for all other supply contracts. The total amount of facility contracts, principally industrial installations, was \$1,266,314,000. Absorption of 750,000 residents in the armed forces offset an influx to war industries so that on Nov. 1, 1943, the census bureau estimated a population loss of 318,284 after 1940.

1944

\$264,419 \$225,969

1943

813 \$7,826,735

\$280.872

329 \$2,864,376

\$256,399

War contracts for the state reached \$10,205,174,000 in 1944 exclusive of food contracts, all supply contracts under \$50,000 and facility construction under \$25,000. The four large ordnance plants were stepped up after the German offensive in late 1944, after having been previously cut back to less than capacity. In the 1944 election, Pres. Roosevelt received 2,079,479 votes to 1,939,314 for Dewey. Gov. Dwight H. Green was re-elected, receiving 2,013,270 votes to 1,940,931 cast for Thomas J. Courtney, Democratic candidate. The only Democratic state officer elected was Edward J. Barrett, secretary of state, but Democratic U.S. Senator Scott W. Lucas was re-elected and Emily Talt Douglas, Dem., defeated incumbent Stephen A. Day, Rep., congressman at large.

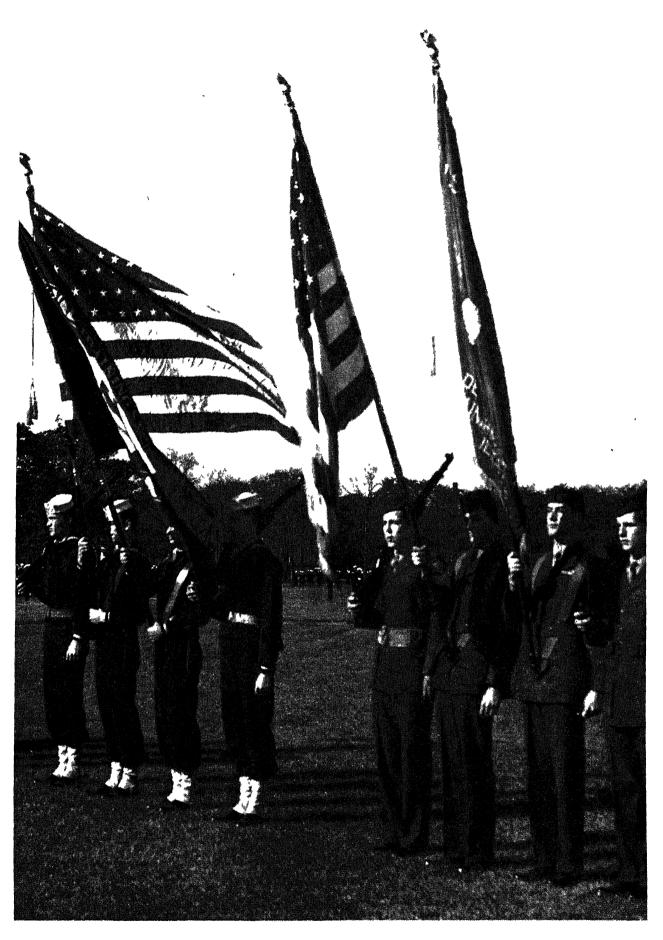

Incumbent state officers Hugh W. Cross, lieutenant governor; Arthur C. Lueder, auditor and George F. Barrett were re-elected. Conrad F. Becker (Rep.) was elected treasurer.

The return of Illinois veterans and the reconversion of industries from war work were the features of Illinois history in 1945. At the close of the year approximately one-third of the state's 890,000 men and 70,000 women in the armed services had been discharged. Re-employment was more rapid than had been expected. In the first 11 months of the year, 400,000 persons were placed in jobs by the U.S. employment service, including 46,646 veterans of whom 4,141 were severely handicapped.

The entire state Republican ticket was elected in Nov. 1946; in Chicago and Cook county, normally Democratic majorities were wiped out in many of the contests.

William G. Stratton, Republican candidate for congressman-at-large, defeated Mrs. Emily Taft Douglas, Democratic incumbent, by a plurality of 367,469. Richard Yates Rowe, Republican candidate for state treasurer, polled a plurality of 474,184 over Sam Keyes, Democrat. Vernon L. Nickell, Republican state superintendent of education, had a plurality of 520,003.

A proposal to pay a bonus to all Illinois veterans of \$10 for every month in service at home and \$15 for every month served overseas was adopted by a vote of 2,173,425 to 980,345.

Illiteracy

Although World War II interrupted many proposed literacy studies and interfered with the world's efforts to reduce illiteracy, available material at the end of the decade 1937-46 showed a distinct increase in world literacy.

A simple statement of ability to read and write is a measure of technical but not of functional literacy. By the end of the decade, no satisfactory test of functional literacy had been developed. In Article 2 of Guatemala's National Literacy law of March 8, 1945, literacy was defined as "not only the knowledge of reading and writing, but also the possession of a minimum of abilities that may help the individual to incorporate himself with the cultural environment of the country." This very workable and far-reaching definition served as the basis for Guatemala's literacy campaign. Other Latin American countries, notably Venezuela and Mexico, also developed vigorous literacy campaigns and greatly increased the literacy of their population, especially during the latter half of the decade.

In the United States, the refusal of the army in 1940 to draft men having less than the equivalent of a fourth grade education focused attention on the problem of illiteracy. Later the army established camp schools to bring its recruits up to the fourth grade level of reading ability. Two other movements were designed to cope with illiteracy; the elementary education movement concerned primarily but not exclusively with foreign-born adults, and the movement to develop functional literacy by simplifying reading materials so that adults with a limited knowledge might still be functionally literate. Both of these measures were obviously stop-gaps.

The 1930 census showed that the illiteracy rate in the United States was 4.3%, but it was estimated in 1941 that the literacy rate had risen to 97%.

Denmark, Sweden and the Netherlands claimed practically no illiteracy while Italy showed 21% of its population over 6 years of age unable to read, Spain, 43% over 10 years of age unable to read or write, and France, 7% over 5 years of age unable to read. England and Wales showed .32% illiteracy using the signing of the marriage contract as the literacy standard.

Literacy in Russia (excluding western Ukraine and western White Russia) increased from 51.1% in 1926 to 81.2% in 1939.

India and China remained among the nations with the largest illiteracy problems and were making strong efforts to solve them. Literacy remained extremely low in India. About 120 out of 1,000 persons were literate in the sense of being able to read and write a letter. The Indian child's school days were cut short as soon as he could help in the field or at home.

Statistics of the ministry of education in China showed that after 1938, 46,348,469 illiterates had been educated. China's fight against illiteracy was bolstered with a new public school law which provided that all children between the ages of 6 and 12 should receive free basic education in public schools.

The United Nations Educational Scientific and Cultural organization announced that it would make a strong effort

to alleviate illiteracy through its education section, under the directorship of Dr. Kuo-Yo Shu of China in 1946. Señorita Elena Torres on Dr. Kuo's staff brought her wide experience acquired in working on the Mexican literacy campaign. U.N.E.S.C.O. chose to apply the term "Fundamental Education" to this phase of its program.

Immigration and Emigration, U.S.

Prior to World War II, U.S. consuls stationed abroad approved visa applications of aliens seeking entry into the United States. This procedure was set aside during the war period. During the period July 1, 1941, to June 1, 1945, a special procedure was evolved for issuing visas. The consul was required to submit the request to the secretary of state, who in turn transmitted it for advice to a committee of representatives of the state, war and navy departments, the Federal Bureau of Investigation and the immigration and naturalization service. Effective Dec. 1, 1941, additional restrictions were placed upon the entry and exit of aliens generally. Except for emergency cases, permits both to enter and to depart were required. Aliens whose movement was considered prejudicial to the interests of the United States were not allowed to enter or depart. These controls gradually were relaxed after the end of hostilities with respect to most aliens.

During the fiscal year 1943, the number of immigrants—aliens admitted to the United States for permanent residence—fell below 25,000. The number of immigrant aliens admitted during the 1930s had risen from 23,068 in the fiscal year 1933 to almost 83,000 in 1939. Following the outbreak of World War II in the autumn of 1939, immigration declined steadily until 1943, after which an upward trend was evidenced.

The war and the consequent disruption in transportation facilities caused a considerable decline in quota immigration. Quota immigrants to the United States totalled 62,402 in 1939. This was 40.6% of the number admissible under the quota laws. For 1945, there were only 11,623 quota immigrants out of the total annual quota of 153,879 permitted entry under the Immigration act of 1924.

Nonquota immigration showed a fairly constant number from the western hemisphere countries not subject to quota restrictions. Although this type of immigration supplied the smaller share of the total immigration from 1938 through 1941, yearly totals of nonquota immigrants after 1942 equalled or exceeded in number those admitted under the quota system. Of the 26,496 nonquota immigrants for 1945, 22,770 were admitted as natives of the following (nonquota) countries:

Vanada8,4	20
Newfoundland	oo
Mexico 5	11
Central America	-0
Trest indies	4 4
South America	44
Other countries	12
Other countries	11

The remainder of the nonquota total were members of particular groups exempt from quota restrictions, such as alien wives and unmarried children of United States citizens, husbands of United States citizens, and persons in a group including professors, ministers and students.

Nonimmigrants included principally the following: government officials, their families and employees; temporary visitors for business or pleasure; persons in continuous transit through the United States; seamen; and those individuals allowed to carry on trade under treaty agreements. Students, although nonquota immigrants, were admitted under conditions similar to those applicable to nonimmigrants. For statistical purposes, emigrants were considered as aliens who had lived in the United States for at least one year and were departing at least that long; nonemigrants were aliens who had entered the country temporarily or who were permanent residents departing for a stay of less than one year. Immigrants, during the period 1938-45, exceeded emigrants by 276,583.

Deportation.-Persons subject to deportation fell generally into two groups: those who entered the United States unlawfully and those who, though lawfully admitted, lost the privilege of remaining in the country because of subsequent conduct. The attorney general, with the acquiescence of congress, could suspend deportation of certain aliens who had close family ties in the United States; thereafter, those aliens might remain as permanent

An act passed in 1929 had prohibited the return of deported aliens without special permission.

Prior to 1925, the number of deportations from the United States had been comparatively small. Aliens in need of public assistance from causes arising after their entry and who requested removal might be removed from the United States at government expense. During the years 1937-45, 4,289 aliens were returned to their native lands under this provision. During this period, 64,032 aliens were deported under warrants of deportation, and 163,392 deportable aliens were allowed to depart at their own expense without warrants of deportation. This total of departures was 227,424.

For the fiscal year 1945, more than 8,000 of the total of 11,270 deported were Mexican nationals. There were 69,490 aliens who were permitted to depart voluntarily in lieu of deportation, 51,000 of whom left the United States via the Mexican border. In 1945 the principal causes for deportation were: entering the United States without proper inspection or by false statements; having been previously deported or debarred from the United States:

remaining in the country longer than authorized; committing a crime, entering without proper documents; entering in violation of the alien contract labour law; having mental or physical defects; violating the narcotic laws; and belonging to immoral classes.

Border Patrol.-With the restriction of immigration in the 1920s, there had been a marked increase in the number of aliens attempting to gain entry into the United States surreptitiously, and at the same time, an increase in smuggling. The immigration border patrol was formed to meet this situation. From the time of its inception in 1924 to 1944, the border patrol captured 4,187 smugglers of aliens and seized more than \$6,000,000 worth of contraband merchandise. During 1945, in the course of patrolling more than 8,000,-000 mi. along the borders of the United States, this organization apprehended nearly 70,000 deportable aliens.

Importation of Western Hemisphere Labourers.—The continued manpower shortage led to the extension of regulations and agreements reached with nearby countries regarding the importation of alien labourers. After 1942, when the first agreements were made, there were 354,896 labourers temporarily admitted to the United States, chiefly from Mexico and the West Indies. Most of these persons were repatriated. On June 30, 1945, there remained temporarily in the United States 99,434 agricultural labourers, 64,990 railroad track workers and 17,333 others employed in industries and services essential to the war effort. Imrédy, Bela

Imrédy (1891-1946), Hungarian politician, was a banking official and a well-known financier before he became premier of Hungary in May 1938. At that time the Hungarian government had joined the axis powers and had passed its first anti-Semitic legislation. Although Imrédy had been looked upon as a liberalizing influence, he continued and even implemented this anti-Jewish policy. His program, the chief plans of which were a capital levy and land reform, was never carried out. Shortly after taking office he visited Germany, was impressed with nazi totalitarianism and on his return to Budapest introduced more and even harsher anti-Semitic laws. Ironically, it was Imrédy's anti-Semitism that led to his downfall, for during a debate in parliament, it was brought out that Imrédy himself was partly of Jewish descent. He was forced to resign in Feb. 1939. The discovery that he had Jewish forbears did not change Imrédy's views on anti-Semitism, however, nor did it lessen his popularity with Adolf Hitler. With the fuehrer's blessing, Imrédy formed a new fascist party, called the National Party of Rejuvenation, which became a powerful and frequently decisive influence in government affairs. In the government headed by Gen. Doeme Sztojay in 1944, Imrédy was named minister without portfolio of economic affairs, but was ousted in August of that year as the Russian armies drew closer to Hungary. He fled the country after the Russian invasion and on June 16, 1945, it was disclosed that he had been seized by U.S. troops near Innsbruck. He was later turned over to the new Hungarian government, tried and convicted in Nov. 1945 on charges of committing war crimes and anti-Jewish acts, and executed Feb. 28, 1946.

Incendiary Warfare

Use of fire as a weapon of war extends back beyond the era of recorded history. The early importance of fire weapons was gradually eclipsed after the invention of gunpowder until, with the introduction of nitrocellulose propellents and explosives, incendiaries were relegated to a position of relative unimportance.

Developments of military technique between 1937 and 1945, however, reversed this trend. Newly developed fire agents and weapons proved to be of such utility that incendiary warfare came to be an outstanding feature of hostilities during the closing phases of World War II.

Incendiary Bombing.-As early as 1918 Germany had

developed and produced a new type of incendiary bomb of which much was expected. Its use in World War I was withheld because the defeat of the Central Powers was obvious by the time it had reached production stage. The existence of this new weapon was not entirely unknown outside Germany; yet no other nation was seriously advancing the offensive employment of incendiary bombs between 1936 and 1939. During these years, however, the British government initiated an extensive program to supplement the fire fighting resources of English cities.

The German electron bomb was the first "secret weapon" of World War II. Its use was expected to lead to the catastrophic destruction of raided cities and to demoralize their populations to the point of surrender. This bomb consisted of a magnesium alloy case containing an ignition charge of thermit (aluminum and iron oxide), designed to burn for several minutes at a temperature of approximately 3500° F. Since the bomb weighed only about two pounds, it was intended to be showered in quantity over burnable targets. In aerial attacks against London and other English cities in 1940 and 1941, chief reliance was placed on the electron bomb. It did produce widespread damage; yet its effectiveness could not be rated as decisive.

Reasons why the electron or magnesium bomb fell short of expectations were: (1) Fire defense proved stronger and more effective than had been anticipated; (2) the luftwaffe was never able to deliver saturating attacks such as became commonplace later in the war; (3) the bomb itself possessed certain technical deficiencies as compared with subsequently developed incendiary munitions.

The serious threat presented by the incendiary bombing of English cities in the early days of the war, however, led to the hurried development by Allied technicians of aerial fire weapons for the bombing of continental targets. Preference was given at first to thermit and magnesium agents because of ease of manufacture and availability of materials.

Oil incendiaries were used in military operations as early as the 8th century B.C. The Germans used some oil bombs against British targets in 1940 and 1941 but without marked success. Light oil derivatives tend to burn too rapidly for general incendiary purposes while heavier products are difficult to ignite. Hydrocarbon oils, however, are extremely efficient generators of heat, which fact induced study of methods to modify their physical characteristics in order to produce a fire-generating agent more effective than the metal incendiaries, thermit and mag nesium.

This development proceeded in two directions. Gasoline was thickened to a gelatinous state by addition of "napalm" to lengthen burning time and to ensure adhesion to walls and ceilings once the bomb had burst. Addition to jellied gasoline of magnesium powder and liquid asphalt produced a "pyrogel" mix which proved to be highly efficient in holding intense heat against firevulnerable surfaces for extended periods. In these developments Allied techniques surpassed those of the axis powers, the latter achieving little improvement in the incendiary munitions that were at hand at the outset of the war.

These newer oil incendiaries, however, were not available to the U.S. army air force at the time the first aerial attack of the Japanese mainland was undertaken in April 1942. The bomb used on the occasion of Gen. James Doolittle's raid on Tokyo contained thermit which, although reacting at high temperature (4,330° F.), had a brief burning period of only about one minute. Conse-

quently the results obtained against Tokyo, although impressive at the time, were scarcely comparable with the effects produced in the later bombing of Japanese targets.

In the first and only appearance of Japanese aircraft over the U.S. mainland, incendiary bombing was the objective. On Sept. 9, 1942, a lone naval seaplane sortied over the Siskiyou National forest in southern Oregon and dropped a fire bomb with the expectation of starting a forest conflagration. This attempt was unsuccessful, because unseasonable rains had lowered combustibility in this area.

German incendiary bombing attacks reached their maximum intensity during the final phases of the battle of Britain. Beginning Sept. 8, 1940, London was attacked for 22 successive nights with fire bombs. During this period an average of more than 700 serious fires were combated each night by the British fire brigade and auxiliary units. The climactic raid of Dec. 29 represented the extreme effort of the German air force to destroy the British capital by fire. Thereafter, German incendiary attacks became more sporadic and the initiative in this field passed to the British.

Tactics of the R.A.F. bomber command, once attack of continental targets was regularly undertaken, involved night flying and the general bombing of areas rather than the precisely aimed bombing of specific points. For this purpose the incendiary type of bomb proved to be more destructive than explosive munitions, although the latter were liberally used for the purpose of restraining fire fighters. Scientific analysis of bombing effectiveness determined that in some instances where fire hazard was substantial, as high as 90% of destruction was attributable to fire bombing. This led to a partiality toward fire weapons on the part of British airmen which was not shared by the U.S. air force when U.S. bombers appeared over Europe.

Incendiary barrage of flame-throwing tanks at "Skyline Ridge," southern Okinawa. Japanese troops offered stiff resistance in this area and had to be burned out of caves during the campaign of April—June 1945

Tactics of the U.S. favoured daylight precision bombing of selected points, for the destruction of which explosive bombs were preferred. It was not until Oct. 1943 that the bomber command of the 8th (U.S.) air force began flying frequent incendiary missions and commenced accumulating data as to the relative effectiveness of incendiary and explosive munitions in precision bombing.

Tactical experience gained by Allied forces in bombing operations against European targets in 1944 and 1945 may be summarized as follows: (1) for area bombing, where exact aiming was not required, the incendiary was the more effective weapon; (2) for precision bombing, use of incendiaries should be limited to targets or sections of targets known to be inflammable, others being attacked with explosive bombs.

On the whole, types of targets encountered in Germany and other European cities could not be rated as especially vulnerable to fire. Nevertheless postwar bombing surveys completed in 1946 indicated that an amazing proportion of damage to both cities and industrial plants was traceable to incendiary attack. Ton for ton, incendiaries proved to be four to five times as destructive as explosives, according to findings of the Strategic Bombing survey (U.S.A.). Actually, fire damage was assessed as equalling destruction of 162,000,000 sq. ft. of targets on continental Europe.

From these studies the following empirical rules could be formulated: (1) when roof coverage of an area equalled 30% or more, prospects were good for sustaining spreading fire; where structures were less compactly grouped, pattern bombing of the area was not justified; (2) for isolated targets, where precision bombing methods were followed, incendiary attack was preferable when directed against any single building where 25% of its structure or contents were inflammable.

The Air Attack on Japan.-It was with considerable

background of experience and data that the bombing of industrial Japan was begun in 1944 by U.S. army aircraft based in Saipan and Guam.

As compared with European structures, the typical Japanese building was recognized as being more readily burnable, the general fire hazard being greatly aggravated by the density of population characteristic of Japanese urban communities. The situation was such as to invite area bombing of industrial districts with the tactical objective of initiating general conflagrations, something that could scarcely have been accomplished in the European theatre.

In the course of attacks made by U.S. bombers from Nov. 1944 until the surrender of Japan, 66 cities with a combined population of 20,000,000 were seriously crippled. In five major metropolitan centres, more than 100 sq.mi. were gutted by fire. Destruction was so complete that the U.S. army air force chief could remark, "Never in the history of aerial warfare has such destruction been achieved at such moderate cost." Postwar analysis indicated that dislocations of the Japanese war effort due to incendiary bombing were so critical that capitulation would have been forced by autumn of 1945 even though atomic bombing had not been undertaken in August of that year.

The incendiary bomb most frequently employed against Japan was a small sized unit loaded with jellied gasoline or the more viscous pyrogel mixture which included magnesium paste and asphalt. These were clustered into bundles having the general ballistic characteristics of a standard 500-lb. bomb, the cluster being designed to open at a predetermined level—usually 1,000 or 2,000 ft. above the target. Larger fire bombs weighing 100 to 500 lb. were also dropped singly against more fire resistant targets.

The incendiary bombing operation was initiated in many instances by demolition of water supplies or other high-explosive missions where these could be undertaken without impairing the combustibility of the target. Incendiaries were then laid down, in types and quantities calculated to induce sustaining fires. Finally, fire prevention efforts of the defense were counteracted by use of fragmentation and delayed-action bombs. Aircraft were usually kept over the target area long enough to prevent the all-clear signal from being sounded until fires were well under way.

Fire Defense.—The tremendous potentiality of the aerial bomber as a distributor of fire-starting munitions gave rise to new and unprecedented problems in fire fighting. Once defense against incendiary warfare had become thoroughly organized, however, it threatened to limit materially the effectiveness of fire bombing, so that the attacker was soon forced to adopt countermeasures against fire fighting.

During the course of World War II, civilian fire defense organizations in Great Britain, Germany, and Japan were successively called on to withstand large-scale incendiary bombing. In order of accomplishment the British fire service could be rated first, the German second and the Japanese third. This statement, however, required some qualification.

Japan was more vulnerable to fire than either Britain or Germany; moreover, the attacks against it were much the most ponderous. The early fire raids against London and other English cities, although seeming at the time to be heavy, were actually moderate compared with the overwhelming assaults eventually delivered against Germany and later against Japan.

British fire defense was built on the realistic premise that incendiary attacks were coming and had to be prepared for. Some 1,400 local professional fire brigades provided nuclei around which the emergency wartime fire organization was developed. When the battle of Britain commenced, this auxiliary service had enrolled 50,000 members trained in operating pumper units. In addition, countless fire wardens were provided to handle small incendiary incidents with portable apparatus.

It was the heroic efforts of this organization that denied Germany the full fruits of its incendiary offensive against British territory. Yet the fact remained that while these attacks were in progress the royal air force was still actively challenging the luftwaffe over England and was able to ward off a considerable part of Germany's bombing potentiality.

German fire defense was never supplemented by an emergency organization comparable with that developed in England, probably because the likelihood of large-scale bombing of the German homeland had never been seriously considered before the war. However, failure of German fire fighters to prevent the fire destruction of so many German cities may be attributed more directly to conditions under which the service was forced to operate than to defects in organization.

With the beginning of 1,000-plane missions over Germany it became customary to withdraw fire fighting units to the perimeter of the city until the attack had ended, for one reason because equipment was too scarce to risk its destruction. While these heavy raids were in progress, civilians took to shelters and sought merely to keep alive until the sounding of the all-clear. By this time fires had accumulated such momentum that efforts to extinguish them were, in most cases, futile.

The Japanese, in contrast to the Germans, had made elaborate preparations for the fire defense of their cities well in advance of World War II. Here failure of passive defense to avert calamitous fire destruction was not due to inefficiency or to lack of courage on the part of the defenders—it followed because the problem was too great to be solved by fire fighting alone.

While fire defense was counteracted in the case of German cities by liberal use of explosive munitions to force personnel away from the attack zone, such measures were sparingly used against Japanese targets, on the theory that here bomber capacities could be more efficiently utilized by 100% incendiary loads. Japanese fire defense was overwhelmed by the simple expedient of starting more fires than the ground defense could possibly cope with.

Experience of the war years indicated that a well developed fire defense was an essential adjunct to protection against aerial attack but that this type of defense could not be expected to succeed without substantial support from a friendly air force.

Tactical Employment of Fire.—Incendiary bombing operations were essentially strategic in nature and, although inevitably causing death, were aimed primarily at the destruction of matériel. As a tactical antipersonnel weapon in direct support of ground force operations, fire also attained considerable usage—particularly in the later stages of World War II.

The flame thrower was the most important tactical incendiary weapon. It differed from the incendiary bomb in that, being intended for use against personnel, it was expected to produce only short bursts of intense, flaming heat. As used in World War I, the flame thrower was spectacular but was not particularly effective. Better combinations of fuel (heavy and volatile oils), introduction

Flame thrower igniting a Japanese structure on Namur Island, which fell to U.S. forces on Feb. 3, 1944. The flame thrower projected a burst of diesel oil or jellied fuel about 35 yards; the flames not only burned but suffocated the occupants of the objectives. Flame was ejected by nitrogen or compressed air

of thickened gasoline and some improvements in the basic design of the portable weapon, all aided in the development of a much better apparatus.

The portable unit was carried by one soldier and was fired under protection of riflemen to pin down the enemy while the flame thrower was being brought into action. The late U.S. model weighed 70 lb. and, under favourable wind conditions, projected flame to a range of 125 ft. At the end of the war much lighter units were introduced, intended to be discarded after firing one burst of flame.

The tank-mounted flame thrower was an innovation of World War II and represented an important development in military technique. It enabled easier penetration of fields of hostile small arms fire so that flame could be brought directly to embrasures of pill boxes and other types of fortifications; by filling these with flame and smoke, the defenders were flushed out or destroyed.

Flame throwers were sparingly used in European operations because tactical situations rarely offered best opportunities for their employment. The reverse was found to be the case in attacking Japanese-held fortifications in the Pacific. Consequently, flame throwers appeared conspicuously in every island operation from the Marianas to Okinawa.

An aerial weapon resembling the flame thrower in action was the jettisonable fuel tank filled with thickened gasoline. This weapon was widely used in 1944 and 1945 by low-flying Allied fighter planes in Europe as well as in the Pacific. It produced a large burst of flame extending over a wide area and was found to be most effective against entrenched troops.

Incendiary rifle and hand grenades of various types were standard equipment of the leading belligerents during World War II. These were filled with white phosphorus, thermit, sometimes gasoline. Such portable weapons proved convenient for destroying materials and munitions and for attacking vehicles and even personnel at close range. Income and Product

The ten-year period 1936–46 witnessed enormous changes in the United States national income and national product. Although a substantial expansion had been achieved from the low levels of the great depression by the beginning of this decade, the U.S. economy was still operating at much less than its potential capacity, with the national income slightly less than \$65,000,000,000. Further recovery occurred in the years before the outbreak of World War II, but it was only in the following period of economic mobilization for total war that the full

productive capacity of the economy was utilized. During these years, the national income expanded to record high levels, reaching \$161,000,000,000 in 1945. The high rate of economic activity was exceptionally well maintained in the first year following the end of World War II. In fact, the postwar inflation in 1946 contributed to raising the national income to a new high figure of \$163,800,000,000.

The decade, embracing recovery and war, also produced significant results in the quantity and quality of national income research accomplished. The National Bureau of Economic Research published its definitive work on national income, National Income and Its Composition, under the authorship of Prof. Simon Kuznets. Kuznets also developed a practical method for estimating the national income from the commodity flow aspect and published his results in a significant volume entitled Commodity Flow and Capital Formation.

During the years of World War II, the official statistics of national income were greatly elaborated in the United States and Great Britain, as well as in several other countries. The trend of this research was in the direction of making the national income statistics sufficiently detailed to serve as a system of national income accounting, covering both income and expenditures for the major segments of the economic system. The results of British government research were made available in a brilliant series of national income White Papers, and the department of commerce research was published in articles in the Survey of Current Business throughout World War II.

As the problems of the postwar period became evident and international organizations were established to deal with those problems, it became apparent that national income research would be greatly stimulated throughout the world. Several of the international organizations included in their charters the requirement that the members furnish national income statistics as a necessary aid in the solution of economic problems. It was evident, too, that administrative use would be made of national income statistics in such problems as the contributions to be made by the various nations to international organizations.

Meaning of Terms.—"National income" represents a summation of the net earnings of the various factors of production derived from their association in current economic production. Both money income and income in kind are included, as long as they are derived from participation in current production. Such income receipts as relief, unemployment benefits, pensions, gifts, capital gains or losses and gains from illegal activities are excluded since they do not represent earnings derived from current productive activity. The incomes included in the compilation are net incomes; that is, in the case of business enterprises, the incomes are counted after deduction of costs of doing business and after allowance for depreciation and business taxes. In the case of corporations, the income is taken after allowance for income and excess profits taxes. The estimates are limited to those incomes ordinarily derived from the market economy. Thus, the value of the services of housewives is not included, whereas the income derived from government employment or government obligations is included. It is well to emphasize that the national income is not simply the sum of money incomes of all persons in the U.S., such as might be reported for income tax purposes.

"Gross national product," as measured by the U.S. department of commerce, represents a summation of three

major components: (1) the market value of goods and services flowing to consumers; (2) the value of the gross output of capital goods retained by private business; (3) the cost value of the goods and services produced or purchased by government. The gross national product differs from the national income in that no allowance is made for depreciation and other reserves (which constitute business expenses in the computation of income) or for taxes paid by business.

Taken together, the national income and national product estimates provide a comprehensive picture of the economic activity of the U.S. as a whole. The two sets of estimates represent the receipts (national income) and expenditures (gross national product) sides of a consolidated national account showing the major transactions that occurred during the year relative to current production of goods and services. The data are useful in giving quantitative expression to economic trends and problems of the national economy as well as in comparing the operations of an individual business firm with the national totals for all economic activity. During World War II, the data proved of considerable value in dealing with problems of economic mobilization and fiscal policy. As attention turned to postwar economic problems, this body of statistics was utilized in studying postwar market potentials and in providing the framework for analyzing such problems as taxation and social security.

Changes After World War I.—The estimates of U.S. national income from 1919 through 1946 are shown in Table I. These estimates are in terms of current dollars and consequently are affected by the general level of prices as well as by the physical quantity of goods and services produced. Since for many purposes the physical quantity of national production, or real national income, is required, a national income series in dollars of constant purchasing power is also shown in Table I.

In assessing the importance of the rise in national income over a period of time, it is essential to take account of the increase in population. As population rises, there are more persons to share in the goods being produced for present and future consumption and also more hands available for contributing to total output. These changes in income produced per capita, after adjustment for fluctuating prices, are shown in Table I.

By 1936 substantial recovery of the national income

Source: U.S. Department of Commerce. *Preliminary.

from the bottom of the depression had been made. As compared with 1932, income had increased by more than 50%, from a level of \$40,000,000 in 1932 to \$64,900,000,000 in 1936. As may be seen in Table I, this recovery in current dollar national income was influenced to only a minor extent by rising prices. The expansion of the national income in 1935–39 dollars was almost equally as impressive, while the increase in per capita income amounted to almost 25%.

The position of the economy in 1936 was, however, far short of full prosperity. A substantial volume of unemployment remained, and the industrial plants of the nation were operating at much less than full capacity. The economic expansion continued in 1937 with the national income rising to \$71,500,000,000, though in that year a larger rise in prices limited the increase in real national income.

The rising trend of economic activity which was in progress after 1933 came to an end in the fall of 1937. Many maladjustments arising from the rise in prices, the sharp increase in wage rates, the accumulation of inventories, the rapid decline in the balance between government expenditures and receipts and other factors brought an end to the recovery movement at a point well below full employment of economic resources. In consequence, 1938 was a year of sharp, though fairly short, recession. The national income declined to \$64,200,000,000. The low point in the downturn was reached about the middle of 1938, when the government expenditure program designed to halt the slump began to take effect.

In 1939 the national income reached \$70,800,000,000, and the economic situation was fairly stable by the time World War II broke out in Europe in September.

During the first months of World War II, little occurred to indicate a material change in the general economic situation. However, after the German war machine demonstrated its power against France, the U.S. initiated a rearmament program that dramatically changed the trend of national income. Even though the rearmament effort did not get under way until the second half of 1939, its impact upon the economy was apparent in 1940, when the national income rose to \$77,600,000,000. With the national defense program being continuously revised upward as the U.S. committed itself to aid the countries fighting Hitlerism, the nation moved more and more rapidly toward capacity operation of its economic system. In 1941 the national income made a spectacular increase to \$96,900,000,000.

Not until after actual entrance of the United States into World War II at the end of 1941, however, was the tremendous production potential of the nation demonstrated. During the two years which followed, unemployment was virtually eliminated, and the labour force of the nation was substantially increased by the recruitment of large numbers of younger persons and female workers. In addition, industrial capacity was enlarged through the war production facilities program fostered by the government. As a consequence, the national income continued to expand by large amounts in 1942 and 1943, with a gain in the earlier year of more than \$25,000,000,000 and a gain in the later of more than \$27,000,000,000.

As may be seen by a comparison of the national income in 1946 dollars and in 1935-39 dollars, shown in Table I, the rise in the national income after 1940 was in part because of the rising trend of prices, but the larger part of the expansion represented an increase in real income. This rise did not have the same significance as an expansion of real income in times of peace from the standpoint

The period of rapid wartime expansion of the national income came to an end at about the close of 1943. By that time the national income was flowing at an annual rate of approximately \$155,000,000,000, and represented virtually complete utilization of economic resources. As inflation of the national income through rising prices was held in check during 1944 by the price control and rationing programs, the national income in that year rose only moderately to \$160,700,000,000. It may be seen, therefore, that the fairly substantial increase in the national income

of economic welfare because it had to be used in the

prosecution of World War II.

Even so, 1944 national income exceeded the 1943 total by only 8% in terms of current dollars, while in terms of constant dollars the increase was limited to 6%.

from 1943 to 1944 occurred largely during the earlier year.

The 1944 level of national income continued to prevail through the summer of 1945. Although the war production program of World War II was curtailed somewhat after the end of the European phase of the war, reemployment in civilian industries was sufficient to hold the income level substantially stable. With the end of the Japanese phase, however, the cutback of war production was so substantial and affected so large an area of industry that unemployment rose and the flow of income turned downward. The reconversion of industry to peacetime products proceeded fairly rapidly, but re-employment in civilian goods lines was not large enough to offset the release of workers from war production and the release of men from the armed forces.

The period of declining economic activity proved to be exceptionally short, considering the magnitude of the industrial shift required from wartime to peacetime production. It lasted for about nine months, reaching a low point in the first quarter of 1946. Despite the interruptions caused by labour-management disputes in the early months of the year, the reconversion of industry was accomplished rather quickly. An upswing in economic activity was begun in the second quarter of 1946 which continued until a strike in the coal industry led to some dampening of economic activity in December. The flow of income was also increased by a large rise in wage rates and a substantial rise in prices which occurred as wartime controls were eliminated after the middle of the year. A preliminary estimate of national income for 1946 showed an aggregate of \$164,000,000,000, or a new record high, although, after adjustment for rising prices, income was lower than in the 3 preceding years.

Distributive Shares of National Income.—The changes in the distributive shares of national income from 1936 until the entrance of the United States into World War II, shown in Table II on p. 631, were, in general, characteristic of the expansion of the business cycle. Just as profits and entrepreneurial types of income had declined most severely during the depression years, so did these components of the national income experience larger expansion in the period of economic recovery. This was the case not only with the earnings of corporations but with agricultural income and the income of other noncorporate business.

For the aggregate of corporations, 1932 was a year of severe losses. The \$7,200,000,000 profit level of 1929 had been converted into an aggregate loss of \$3,600,000,000 as a consequence of the economic depression. In the years of recovery which followed, corporate profits rose rapidly, though up to the outbreak of World War II in Europe

they did not approach the 1929 figure. In both 1937 and 1939, corporate earnings were near the \$4,000,000,000 mark. The large stimulus given to profits by high levels of economic activity was demonstrated in the rearmament period. As the economy approached capacity output in 1941, profits rose to \$8,500,000,000, double the 1939 figure, even though taxes on corporate income had been substantially increased.

While less spectacular than corporate earnings, the net income of noncorporate business rose very materially during the recovery period. By 1937 agricultural income was greater than three times the level at the bottom of the depression and approximately equal to the income received in 1939. On the other hand, the entrepreneurial income of nonagricultural business doubled from the bottom of the depression to 1937, though it remained well below the 1929 total. With the rearmament boom in 1941, further large gains were made, agricultural income rising to \$6,300,000,000 and the nonagricultural segment reaching \$9,600,000,000.

Salaries and wages also benefited from the recovery movement, though at a slower pace than the profit incomes. By 1937 the influence of increased employment at higher wages had raised salary and wage income to slightly less than \$45,000,000,000, approximately 50% higher than the level at the bottom of the depression. During 1938–39 a gain of about the same magnitude was made, the total rising to \$60,800,000,000 in 1941. During this entire period, the rising trend of employment and the increase in the average working week were the primary factors responsible for the rise in total wage payments. There was, however, a significant increase in wage rates and a shift in the percentage of the labour force that was employed in the higher-paying industries.

Supplements to salaries and wages, which are accruals to the income of labour through pension and other benefit plans, became an important segment of the national income for the first time during this period. While there had been such supplements on a small scale for many years, the enactment of a national social security system raised this element of income to significant magnitudes. By 1937 the supplements amounted to \$3,300,000,000.

Income from interest and rents was the only component of national income to remain fairly stable as the economy moved from depression to prosperity. Although there had been a large decline in this component from 1929 to 1932, the aggregate rose from \$7,100,000,000 in 1932 to \$8,000,000,000 in 1941. A major influence behind this stability was the decline in interest rates which occurred during these years.

The changes in the distributive shares of national income which occurred during the years of World War II differed in several important respects from the pattern of the recovery period. Although the level of economic activity rose to record highs as the nation's economy was fully mobilized for war, and though this expansion was particularly great in the mining and manufacturing areas because of the requirements of the munitions program, corporate profits rose only moderately after 1941. The peak reached in 1944, slightly less than \$10,000,000,000, compared with the 1941 total of \$8,500,000, oo. The moderateness of this rise in net corporate earnings resulted primarily from the heavy taxes on corporate income which were imposed during World War II. The normal rate of tax on corporate income was increased to 40% and, more importantly, an excess profits tax with a very heavy rate

schedule severely limited the increase in net corporate earnings. Moreover, war contracts were in many cases renegotiated at lower prices in an effort to limit profit margins to reasonable proportions.

Another significant difference from the prewar pattern was the large rise which occurred in income from interest and rents. The 1941 total of \$8,000,000,000 increased to \$11,800,000,000 by 1945. The most important influence behind this increase was the rise in government interest payments that occurred as a consequence of a tremendous increase in the national debt. In addition, rent income rose materially, even though rental rates were fairly well held down by administrative controls, because rental units were so fully and so continuously occupied during World War II.

The largest wartime increase in income occurred in the agricultural field when net returns approximately doubled between 1941 and 1945. The net agricultural income of \$12,500,000,000 in 1945 far exceeded any peacetime year. It was caused in part by the large increase in agricul tural production, but the much more important influence was the sharp advance of agricultural prices. Prices in this segment of the economy were less well controlled during World War II than was the case with other types of commodities and services.

The income of nonagricultural entrepreneurs also rose materially, reaching a figure of \$13,100,000,000 in 1945 as compared with \$9,600,000,000 in 1941. Higher prices and a greater volume of business were the significant factors accounting for this expansion of income.

In terms of dollars, the largest increase in income during World War II was in the salary and wage component. Total salaries and wages of \$60,800,000,000 in 1941 advanced to \$112,800,000,000 in the peak war year of 1944. Many factors contributed to this expansion. Probably the most important was the increase in the number of persons employed, including those serving in the armed forces of the nation. The volume of employment was also increased by a substantial lengthening of the average work week as every effort was made to increase the production of the implements of war. As overtime was paid for at premium rates of pay, the lengthening of the work week contributed materially to the increase in wages. Another significant factor which tended to raise the total flow of wages by more than the increase in hours worked was the fact that the increase in employment hours came in substantial measure in the manufacturing and mining industries, where wages were higher than the national average. In addition, there was a tendency throughout World War II for wage rates to increase because of the shortage of labour. However, after the Little Steel formula was established in 1942, the government's control of wage rates effectively limited their increase for the wartime period.

The year which followed the end of World War II, being one of reconversion and inflation, could not be taken as establishing the postwar pattern for the distributive shares of national income. Many abnormalities arose, though it was evident that some of the peacetime characteristics of the economy were also emerging. By and large, the components of national income rose in 1946, the only exception to this tendency being in the area of wages and salaries. The decline in this area, which was initiated in 1944, was entirely because of shrinkage of the labour force and the decline in overtime work which followed the ending of World War II.

A reduction in the size of the armed forces, which allowed many younger men to resume their education, and the return of many women to the home as the war pro-

duction program was eliminated led to a fairly sharp decline in wage and salary payments. The decline was somewhat offset by the general increase in wage rates which occurred in 1946. In large measure, the reduction in pay envelopes that came as overtime pay was eliminated was offset by wage rate increases. The total wage bill of the nation dropped from \$112,800,000,000 in 1944 to \$106,000,000,000 in 1946.

Corporate profits also declined in 1945 with the liquidation of the war production program. In the early part of 1946, profits were still being depressed by this factor as well as by a rather widespread series of strikes which occurred at that time. However, the elimination of the excess profits tax at the end of 1945 and the large expansion of production which was initiated after the first quarter of 1946 produced a very favourable profit picture for the year as a whole. Preliminary estimates of profit for 1946 of \$12,000,000,000 showed this component of income at a new record high level.

The net income of unincorporated business also rose materially in the first postwar year. In the case of agricultural income, this was because of the inflationary trend of prices which followed the relaxation of wartime price control. Agricultural income rose to an estimated figure of \$14,400,000,000,000, a record high. The expansion in nonagricultural business income was of similar proportions. It, too, resulted in large part from rising prices, though perhaps equally important was the increase in civilian goods which became available after the end of World War II.

Gross National Product.—As the national income measures the income to the various factors of production arising from current productive activity, it necessarily follows that the general trend of the gross national product over the decade was similar to that of the national income. The value of national output fell precipitously during the depression years to a low of \$55,400,000,000 in 1932 and in the years of recovery followed a generally upward trend as the volume of business activity expanded. The gross product reached \$70,800,000,000 in 1935 and continued to rise in the years before the outbreak of World War II, with the exception of the recession year of 1938, to a total of \$88,600,000,000 in 1939. The pace of the expansion was considerably accelerated under the stimulus of the rearmament program, with the total rising to \$120,200,000,000 in the short space of 2 years.

The statistics on the components of the gross national product, given in Table III on page 633 show the character of the depression and later recovery. Of the three major components of the gross national product, government expenditures, private gross capital outlays and consumers' expenditures, the severest decline from 1929 to 1932 came in the capital goods area. The drop from \$17,600,000,000 to \$2,200,000,000 was so drastic as to stamp the depression as primarily a failure in the investment of

capital. While all types of capital outlays declined, it may be seen that the drastic curtailment in construction activity and the severe liquidation of business inventories in 1932 were the factors which in magnitude were most responsible for the disastrous deflation. By contrast, the drop in consumers' expenditures was much less severe, though the large proportion of total output accounted for by this segment meant a large decline in the dollar total.

In the years of recovery, these downward trends were reversed with a new element added, the substantial increase in government expenditures prompted by the pump-priming philosophy of the Roosevelt administration. It may be noted that government expenditures declined very little during the depression. But in the years after 1932 this component of the gross product was greatly expanded. Expenditures by the federal government reached \$3,900,000,000 in 1935 and rose further to \$7,900,000,000 in 1939. Capital expenditures responded to this stimulus in the sense that inventory liquidation was halted and there was a substantial increase in outlays for durable equipment. Expenditures for construction, however, remained sluggish, the total of \$3,600,000,000 in 1939 being still less than half the volume of 1929.

The driving force behind the expansion after 1939 was, of course, federal expenditures for goods and services required in the rearmament effort. While there was a significant increase in war outlays during 1940 because of the inauguration of the defense program in that year, the real results of the defense program became fully evident in 1941, when war expenditures rose to \$13,300,000,000. Economic activity of all kinds was intensified, and there was a great effort to increase the production of goods before the shortage of materials made it impossible. Gross capital outlays rose to the highest figure on record to that time, \$19,100,000,000 in 1941. The prospect of shortages contributed to the large accumulation of inventories, and the output of producers' durable equipment attained a record figure of \$8,900,000,000. Private construction activity was the only area which did not reach a new high level, partly because a considerable quantity of materials was already being utilized for the government's construction program.

There was also a notable expansion in consumers' expenditures as the volume of income flowing to consumers rose with the level of economic activity. In the space of two years, this aggregate increased from \$61,700,000,000 to \$74,600,000,000 in 1941. As prices were somewhat lower in that year than in 1929, this meant that the real volume of goods flowing to consumers was much higher than ever before.

After Pearl Harbor, the U.S. rearmament effort was converted to a program of total economic mobilization. What occurred in the following two years was best reflected in

the government's war expenditures. This segment of total output skyrocketed to \$81,300,000,000 in 1943 to make the government's budget the dominant element in the economic situation. Under this stimulus, the gross national product underwent an unprecedented expansion, rising by 50% to an aggregate of \$187,400,000,000 in 1943.

"Roll Out the Barrel." Shoemaker of the Chicago Daily News criticized price control as the cause of continuing scarcities among consumers' goods following the close of World War II, although postwar national incomes remained high

It may be observed that both in 1940 and 1941 the expansion of war production had not required curtailment of civilian output. In fact, both capital formation and consumers goods and services steadily increased. This was made possible because of the large pool of unemployed economic resources, both men and machines, that was available at the beginning of the rearmament program.

After 1942, however, this situation came to an end as the value of war output increased more than the total gross national product. It meant that the rising flow of war matériel was produced in part by reducing various categories of nonwar output. Both federal nonwar and state and local government utilization of current production were decreased. The major cut, however, occurred in the area of private capital outlays, where the 1941 total of more than \$19,000,000,000 was reduced to \$7,600,000,000 in 1942 and to \$2,000,000,000 by 1944. Private expenditures on construction and producers' durable equipment were substantially reduced, and, in addition, the large increase in inventories of 1941 was converted into a steady decrease throughout World War II.

In terms of dollars spent, consumers purchases of goods and services increased materially from 1942 on. The expenditure total of \$74,600,000,000 in 1941 had by 1944 reached \$98,500,000,000. This increase, however, was mostly because of the influence of rising prices, although even in terms of dollars of constant purchasing power there was apparently a small increase in consumers expenditures over the period. That it proved to be possible to maintain consumers' goods and services at so high a level in the face of the tremendous requirements of the war program was because of two important factors. In the first place, the total of consumers' purchases was larger than current production by virtue of the drawing down of business inventories of consumers' goods. In the second

place, the fact that the United States did not have to allocate manpower meant that the restrictions of consumers' goods were largely the result of shortages of raw materials and imported commodities. Because the war program consisted mostly of munitions and munitions manufacturing facilities, the material shortages were largely confined to durable goods. Consumers' durable goods declined fairly sharply, and this decline would have been very much greater had it not been for previously accumulated inventories. While there were isolated shortages among the nondurable goods, on the other hand, many of these commodities as well as virtually all consumers' services were increased. The decline in consumers' durable goods, therefore, was more than offset by increases in nondurable goods and services.

By the beginning of 1944, the government's war production program had virtually reached its peak; it continued at a fairly stable level until the end of World War II in Europe. There was likewise relative stability in the level of the gross national product, though the tendency for prices to increase moderately led to a further rise in this aggregate. In 1944 government war expenditures were \$83,700,000,000, and the gross national product was \$197,600,000,000. Thus, the war effort was utilizing more than 40% of gross output. The output available for private use, approximately \$100,000,000,000, was somewhat higher than the comparable figure for 1941 in dollar terms, but after allowance for the rise in prices, it was substantially lower. As previously mentioned, the curtailment had come entirely in the category of private capital outlays.

With the successful conclusion of World War II, there occurred a sharp liquidation of the war production program and a rapid demobilization of the nation's armed forces. As a result, government war expenditures declined sharply in the second half of 1945 and the first half of 1946. From the wartime peak in 1944, war expenditures dropped to \$69,400,000,000 and \$17,600,000,000 in the 2 succeeding years.

The immediate effect of the liquidation of the war effort was a decline in total output. However, the freeing of economic resources from the requirements of war made possible an expansion of nonwar economic activities. The reconversion of industry was so rapid that by the first quarter of 1946 the low point in total production was reached, so that for the rest of the year the increase in civilian goods and services more than offset the decline in the military area. Even in 1945 all the nonwar components of the gross national product showed increases over the preceding year. These increases were far exceeded by the expansion in 1946. The dollar totals were inflated to some extent by the sizable rise in prices which occurred, particularly after the middle of the year, but the major part of the increase reflected a rise in the real flow of goods and services.

Just as private capital outlays had contracted most sharply during World War II, so did they experience the largest increase during the reconversion period. From a low of \$2,000,000,000 in 1944, private gross capital formation rose to \$29,300,000,000 in 1946, a figure 50% larger than the previous record of 1941. The construction industry made a substantial beginning toward a peacetime basis and the output of machinery and equipment was at capacity levels. In addition, the necessity of filling the raw material and goods-in-process pipeline in the civilian sector of the economy produced an exceedingly large increase in business inventories. Furthermore, the tremendous shortages of goods in foreign countries led to a record high of net exports, supported as it was by govern-

Table III.—Gross U.S. National Product or Expenditures† (In billions of dollars)

ment loans and by the large volume of foreign assets that had been accumulated during World War II.

Consumers' expenditures rose to the unprecedented level of \$126,000,000,000, reflecting higher prices as well as the increased volume of goods. Expenditures for durable goods to \$13,700,000,000, more than double the 1944 total, as the reconversion of these industries became effective in increasing the flow of final products. More surprising was the heavy demand for nondurable goods. This reflected the decrease in purchasing of food and other nondurable items by the armed forces, as well as the increased buying which occurred as the civilian population replenished stocks

of goods that had been depleted during World War II. In the closing month of 1946, production was somewhat restricted by a major strike in the bituminous coal industry. While the reconversion of industry had been substantially completed, the economy was still characterized by severe shortages in many lines of goods. It was apparent, however, that the production of finished goods would be further increased in 1947 and that the area of shortages would be materially reduced.

Disposition of Income.—The statistics showing the breakdown of national income by use of funds are contained in Table IV. The primary purpose of this breakdown of the national income is to show the impact of taxes on the flow of personal income, and the allocation which consumers make of their income between consumption expenditures and savings.

In the recovery period, the pattern of income use was typical of the rising phase of the business cycle. Income payments rose from \$47,400,000,000 in 1932 to \$70,800,000,000 in 1939. Tax payments kept pace with this increase, though by 1939 the level of taxes was higher than in 1929 because of the higher rate schedules that were in force. The distribution of disposable income between savings and expenditures followed a normal pattern during this period.

During 1941-45, however, the requirements of the war economy produced many abnormalities. The phenomenal increase of the national income has already been noted; a comparable increase occurred in income payments to individuals. This aggregate advanced from \$70,800,000,000 in 1939 to \$156,800,000,000 in 1944, but as the high wartime rates of taxation were imposed tax payments began to cut heavily into the income flow. From the level of \$3,100,000,000 in 1939, personal taxes increased to \$19,400,000,000 in 1944 with the result that the expansion of disposable income was limited to \$137,400,000,000.

The main abnormality of World War II came in the proportion of disposable income that was spent. This was restricted by three factors in the wartime economic situation. First of all, there was the limit on the supply

*Preliminary, based on partial-year data.
†Detail will not necessarily add to totals because of rounding.

of goods and services that could be produced for consumers in view of the large requirements of the war effort. As previously indicated, the supply of durable goods was actually curtailed in physical terms. But even the supply of nondurable goods and services rose much less than would have been expected with the increase in income available because of a sheer lack of economic resources. The second factor which limited consumers' expenditures was the effectiveness of government price control and rationing. These programs meant that the amount of dollars spent for the available supply of goods was held well below what would have been spent if free bidding in the market place had been permitted. The third factor was the encouragement given to saving on the part of consumers by the war bond campaigns and other means.

The result of all these factors was that consumer expenditures rose much less proportionately than the increase in disposable income and that a much greater proportion of income was accumulated in the form of savings. From a level of \$6,000,000,000 in 1939, the net savings of individuals rose to \$38,900,000,000 in 1944. This was an unprecedented savings level and one which could not be expected under peacetime conditions.

With the ending of World War II, this process began to reverse itself. Taxes were reduced moderately at the end of 1945 but, on the other hand, there was a large increase in government transfer payments largely in connection with the G.I. Bill of Rights which raised disposable income in 1946 above its wartime level. The large shift came, however, in the proportions of income spent and saved. Consumers expenditures rose by \$20,000,000,000 in 1946, while the level of savings dropped to \$18,000,000,ooo for that year from its high of almost \$40,000,000,000 in the second quarter of 1945. The removal of wartime restrictions had reduced the level of savings to about a normal proportion of income in the course of little more than a year. (See also Budgets, National; Business Re-VIEW; DEBTS, NATIONAL; WEALTH AND INCOME, DISTRIBU-TION OF.) (M. Gt.)

U.S. per capita income for the civilian population in 1945, according to data prepared by the U.S. department of commerce

Great Britain

Under conditions of war the ordinary difficulties of measurement of "national income" were at their greatest. Changes in the character of production make peacetime indexes of prices partly inapplicable; and, apart from this, prices are subject to a large measure of distortion by special controls, subsidies and taxes. In time of war a high proportion of the national income is consumed on government account; and the methods of valuing this large slice of the total are necessarily to some extent arbitrary. It was not possible to say, with any approach to accuracy, by how great a percentage the physical product of industry was altered during World War II; for there was no way of adding up all the goods and services produced except in terms of money values, and, if these were distorted, the entire measurement was thrown out. Accordingly, what is said about both income and product must be taken as true only on certain assumptions, and even so as subject to a large margin of error.

The only source from which it was possible to derive any estimates of the national income of the United Kingdom during the decade 1937–46 was the series of White Papers issued annually by the government after 1941 in connection with the budget. These papers, prepared in the central statistical office, attempted to present a picture of the course of national income and outlay after 1938; but it was not possible to link them directly to earlier unofficial estimates of national income made by Prof. A. L. Bowley and Colin Clark. Table V, taken from the White Paper of April 1946, gives the general picture.

This table gives several different sets of figures corresponding to different definitions of national income. The final totals (series 11) correspond most closely to what the

ordinary man understands by the term, as they represent estimates of the total prices paid, or imputed, in respect of all goods and services currently produced. These totals include the part of current production that is needed to make good depreciation and obsolescence of capital goods used in production; but obviously from the figures the allowance for these purposes was kept very low during the years of World War II. The totals (series 11) include also all indirect taxes since these enter into the selling prices of the goods produced; but as against this all subsidies used to reduce prices are deducted. Thus, the size of the national income, in this sense, is affected both by subsidy policy and by taxation, especially by shifts between direct and indirect taxes. For these reasons, as well as because of price changes, the totals of series 11 give no effective indication of real changes in either income or product.

The totals of series g are somewhat more informative, as they exclude indirect taxes and subsidies. They are, however, of course affected by price changes and measure only the money value of the national product, not its real amount. The totals of series 3, giving the aggregates of private income (made up of personal incomes and of impersonal or corporate incomes, such as company reserves), are to some extent misleading since they include those parts of private income which are paid out of taxation; e.g., national debt interest and social insurance and other benefits as far as they fall on public funds. These "transfer payments" are excluded from the totals of series 5; and these totals, plus the small sums derived from public trading and ownership of property, make up those of series 7. Thus, for measuring gross money income, we start from the totals of series 11, and for measuring the value of output we start from the totals of series 7.

The next step is to do what can be done to convert

Table V.—National Income and Product of the United Kingdom, 1938–45

these totals into estimates of real income and product by relating them to changes in the level of prices. Here the difficulty is that no index measuring all price changes exists, or indeed can exist. There are various indexes of particular groups of price changes—wholesale prices, retail

prices and cost of living, import prices, export prices, wage-rates and so on—but none of these is wholly suitable for use in converting the money income or the money value of the product into real terms. The index commonly used is that of wholesale prices; and this is clearly preferable to the cost-of-living index, which during the years of World War II was much affected by subsidies designed to keep down the prices of essential foods. The respective movements of the wholesale price and cost of living indexes from 1935 to 1940 are shown in Table VI.

Table VI.—Index of British Wholesale Prices and Official Index of British Cost of Living, 1935–46

1005						Wholesale		1041					Wholesale	Cost of Living
1935		٠			٠	8 <i>7.7</i>	92	1941	٠	٠	•		150.5	128
1936						93.0	95	1942					157.1	129
193 <i>7</i>						107.2	99	1943					160.4	128
1938						100.0	101*	1944	٠			-	1 <i>63.7</i>	130
1939						101.4	102	1945					166.7	131
1940						134.6	119	1946					1 <i>72.7</i>	131
*\$6	nt	1.	1	93	۰.	=100.								

Although wholesale prices appear to have risen much more than the cost of living, of which the official index was kept down a great deal by subsidies, much more than the actual cost of living as a whole, the prices of both imports and exports rose much more sharply than the general wholesale index. The figures are given in Table VII, since for some purposes, it would be more appropriate to use them as means of measuring the real changes in output.

If the figures of national income in terms of net product at factor cost are converted by means of the index of wholesale prices, the results are as shown in Table VIII. These converted totals at any rate come much nearer

Table VII.—Index Numbers of British Import and Export Prices 1938–45 (December of each year)

United Kingdom had risen by about 10%.

The national income and the national product were of course affected in opposite ways by the withdrawal of large numbers of workers for service in the armed forces and by the recruitment for productive occupations of many persons previously not "gainfully occupied," principally

housewives or unemployed. The documents presented by the British government during the Washington loan negotiations of 1945 showed in summary form the effect of the wartime changes in total manpower and in its distribution between 1939 and 1944, when the war effort reached its height.

Table IX.—Distribution of Labour Force in Great Britain, mid-1939 and mid-1944 (In millions)

	Mid-1939	Mid-1944	Change
Armed forces and civil defense	0.6	5.2	+4.6
War industries (munitions)	1.4	5.0	+3.6
Direct export industries	1.3	0.3	-1.0
Other industries and miscellaneous		9.5	-2.8
Distributive trades		1.9	-1.0
Unemployed	1.3	0.1	-1.2
Total	19.8	22.0	+2.2

Thus, a loss of 4,600,000 persons to the armed forces and to civil defense was partly made good by the absorption of 1,200,000 unemployed and by an addition of 2,200,000 persons to the total occupied, leaving a net deficit of 1,200,000 for all forms of productive activity. The reduction of exports brought down this deficit to a mere 200,000; but this involved a fall in the volume of exports by at least 70% and led to a heavy deficit on the balance of payments, partly made good by lend-lease.

We may now go back to the totals of net national product (series 7 of Table V), and consider how they were applied during the years of World War II, as shown in Table X.

Table XI compares personal consumption at 1946 prices with the same consumption valued at the prices prevailing in 1938.

Thus, the volume of personal consumption fell between 1938 and 1943 by more than 20%, and the level of 79% of prewar consumption was maintained only by making large drafts on capital, both by selling overseas investments and by letting home productive equipment run down. The total decumulation of capital at factor cost for the years 1940-45 is estimated at £5,829,000,000, of which

four-fifths was accounted for by loss of overseas assets or the piling up of new foreign debts. The Washington loan documents showed that up to June 1945 Great Britain had sold external capital assets valued at £1,118,000,000 and had incurred new foreign debts of £2,879,000,000, besides a net loss of £152,000,000 in gold and dollar reserves and other losses put at £49,000,000, giving a total of £4,198,000,000, apart from obligations under lend-lease. Internal disinvestment was put at £885,000,000 up to the end of 1944.

The total population of Great Britain, excluding Northern Ireland, rose from about 46,466,000 in June 1939 to 47,646,000 in June 1945, that is, by 2½%. Thus, the reduced total consumption was spread over a larger number of persons. As demobilization proceeded, the return of

manpower from the fighting services to production was partly offset by the withdrawal from industry of elderly persons who had postponed retirement and of women who returned to family life. The total working population, including those in the forces, fell from 22,281,000 in June 1943 to 20,232,000 in June 1946. Of these, the number of males fell from 15,028,000 to 14,569,000, and that of females from 7,252,000 to 5,663,000. The numbers recorded as unemployed rose from 60,000 to 376,000, and there were in June 1946, 750,000 demobilized persons from the armed forces who had not yet taken up civil employment. In these circumstances, the total volume of industrial production could not be expected to rise. There were, in fact, in June 1946 fewer persons employed in civil occupations than in June 1943, though there had of course been a considerable transference from the war industries to normal production. The unemployment that

existed was mainly transitional: there was, in the whole economy, a marked shortage of manpower, and this seemed likely to continue in view of the decline in the number of new juvenile entrants because of the fall in the number of births in the interwar years.

On the average of the years 1936–38, the home-produced national income of the United Kingdom was supplemented by a net income from overseas of £352,000,000, made up of £203,000,000 from foreign investments, £105,000,000 from shipping services and £44,000,000 from financial, insurance and other services. By 1945 net income from foreign investments had shrunk to about £97,000,000, without allowing for sums due on new debts incurred; and there had been a heavy reduction in British-owned shipping tonnage, from 22,000,000 deadweight tons to about 16,000,000.

Thus, on all accounts, Great Britain emerged from World War II with real national income and immediate

The national product of Great Britain during World War II was partially affected by the removal of a large segment of its labour force to the armed forces. This shiff in manpower was compensated for in part by the entrance of women into industry and, as shown above, the agricultural land army

prospects seriously impaired. Even if it had been possible to convert all the capacity used in producing war goods to production for peacetime needs, the position would have been none too good in face of the changed external position of the British economy. But the position was in fact much worse than this, because the disinvestment in the industries which were cut down during World War II, and the consequent failure to keep plants up-to-date, involved both a great difficulty in changing over rapidly from war to peace production and the application of a substantial part of the currently produced national income to the production of new capital goods, as well as to the replenishment of stocks. It was, moreover, imperative to devote a high proportion of the available capacity to production for export, in order to pay for necessary imports of foodstuffs and materials. It was estimated that, in order to reach a satisfactory postwar balance of payments, it was necessary to aim at a level of commodity exports 75% higher in volume than before World War II. India

A subcontinent projecting from the mainland of Asia, India lies between 8° and 37° N.; at the end of 1946, it comprised 11 major or "autonomous" provinces, 5 minor areas directly administered by the central British government and 562 states under Indian rulers. The last were scattered about the subcontinent and varied greatly in size and importance, as well as in the powers enjoyed by their rulers. British India (the 11 major provinces and 5 minor areas) had its capital at New Delhi and was under a viceroy and governor-general, who was also the representative of the crown in its relations with the Indian states. Area: 1,581,410 sq.mi., of which the native states and agencies totalled 715,964 sq.mi.; pop.: (1931 census) 338,-119,154; (1941 census) 388,997,955 (+15%). Chief cities (1941 census): Delhi (cap., 521,849); Calcutta (2,108,891); Bombay (1,489,883); Madras (777,481); Hyderabad (739,-159); Lahore (671,659); Ahmedabad (591,257). Languages (1931): Indo-European (Hindustani, Bengali, Punjabi, Marathi, etc.) 73.5%; Dravidian (Telugu, Tamil, etc.) 20.5%; Tibeto-Burmese 3.7%; Munda 1.5%; Tai-Chinese 0.7%; others 0.1%. Religions: Hindu 65.5%; Mohammedan 24.3%; Christian 1.6% (slightly more than half of them Anglican and Protestant; the rest Roman Catholic); Sikh 1.5%; Buddhist 0.6%; Parsee 0.3%; tribes and others 6.2%. Ruler: George VI, king emperor. Viceroy and governor general: Lord Linlithgow (April 1936-1943); Field Marshal Lord Wavell (after Oct. 20, 1943).

Political Landmark.-The Government of India act, 1935, was a landmark in political history, for it brought the country a further step on the road to self-government. The provinces were to enjoy full responsible government of the parliamentary type. At the centre there was to be an all-Indian federation, in which for the first time representatives of British India and the Indian states were to sit together. Dyarchy, abolished in the provinces, was to be reproduced at the centre; foreign affairs and defense were to be reserved to the governor general, while the remaining portfolios were to be transferred to ministers responsible to the federal legislature. The federal part of the act was to come into force when the requisite number of princes signed the instrument of accession to the federation. As this number was not forthcoming by July 1936, it was decided to proceed with the provincial provisions, leaving the centre unreformed; this meant that the whole executive remained responsible to the secretary of state and parliament. The first elections under the act were held in 1937, and resulted in the return of representatives of the Indian National Congress party in a majority in 8 out of the 11 provinces. In the remaining three, coalition governments with Moslem premiers were formed. Thanks largely to the co-operation of the Indian civil service, the experiment was a success on the whole, and much useful legislation was passed. Communal tension, however, was increased, especially in the limited provinces, where there was a powerful Moslem minority.

On Sept. 3, 1939, hostilities broke out with Germany. India, not having attained dominion status, found herself automatically involved in war without the formal assent of the legislature. Congress thereupon withdrew its ministries from the provinces where it had a majority "in order to dissociate India from the war, and to enforce the Congress determination to free India from foreign domination." It was stated in a resolution passed at its Ramgarh session (March 20, 1940) that "Congress considers the declaration by the British government of India as a belligerent country, without any reference to the people of India, as an affront to them which no self-respecting and freedom-loving people can accept or tolerate-Congress therefore strongly disapproves of Indian troops being made to fight for Great Britain, and of the drain from India of men and material for the purpose of the war." The Defense of India bill was, however, passed with the consent of the other political parties, including the Moslem league.

In 1940 the war took a disastrous turn for the Allies. The Italian forces in East Africa threatened the vital lines of communications running through the Suez canal and the Red sea. Thanks to the 4th and 5th Indian divisions, however, the Italians, though greatly superior in numbers, were routed after a hard-fought campaign. The Indian divisions were then sent to North Africa, Syria and Iraq.

"August Offer."—Meanwhile, Lord Linlithgow, who had become viceroy in 1936, was untiring in his efforts to bring the Indian political parties together. In Aug. 1940 he made what was known as the "August offer." Its main provisos were: (1) it reaffirmed that India's goal was free and equal partnership within the British commonwealth; (2) it undertook that, immediately after the war, a body representative of the principal elements in Indian national life should be set up to devise the framework of a new constitution, according to their own political, economic and social conceptions; (3) it stipulated that power should not be transferred to any party whose authority

Riots broke out in Bombay and other cities of India Aug. 10, 1942, the day following Gandhi's arrest by the British

was denied by powerful minorities; (4) it stated that, while sweeping constitutional changes could not be carried out in wartime, the viceroy would invite representative Indians to join his executive council, and a war advisory council would be set up.

The offer was rejected by the Indian National congress, which declared that it would accept nothing short of complete independence, and by Mohammed Ali Jinnah, president of the Moslem league, who demanded the setting up of Pakistan, or separate Moslem states in northwest and northeast India. (See map, p. 644.)

Fresh disasters were in store when on Dec. 7, 1941, Japan launched its attack on Pearl Harbor. The Japanese land armies advanced through Malaya, and the great naval fortress of Singapore, guarding the entrance to the Indian ocean, fell on Feb. 15, 1942. Burma was invaded. The British evacuated Rangoon and Mandalay and fell back to the Indian frontier, carrying with them the bulk of the British and Indian civil population. In military circles, the invasion of India seemed imminent; it appeared doubtful whether the Japanese advance could be stemmed with the forces available.

But this had little effect on Indian party politics. Pandit Jawaharlal Nehru declared that co-operation with Britain in the war-effort was unthinkable, and the Moslem league warned the Indian government that attempts to appease Congress by opposing Pakistan would be resisted by force. Even in moderate circles, suspicions of British integrity had been roused by the misunderstanding which had arisen over clause 3 of the Atlantic Charter, which, Winston Churchill declared, applied primarily to "the nations under the Nazi yoke." The only Congress leader who took a realistic view of the situation was Chakravarti R. Rajagopalachari, the veteran premier of Madras, who toured the province urging the people to resist the invader to the death, and put forward a powerful plea for Hindu-Moslem conciliation and the whole-hearted support of the British war-effort in the face of the common peril. But his words fell on deaf ears.

The Cripps Mission.—On March 11, 1942, Churchill announced in the house of commons that the war cabinet had agreed unanimously on conclusions, which they believed to be just and final, for present and future action in

India, and that the lord privy seal, Sir Stafford Cripps, who had volunteered for the task, would go to India to satisfy himself that these would achieve their purpose. Churchill said that Sir Stafford would strive, in the name of the British government, to procure the necessary measure of assent, not only from the Hindu majority but also from the great minorities, among whom the Moslems were the most numerous and on many grounds preeminent. He would also consult with the viceroy and the commander in chief on the military situation.

Sir Stafford Cripps arrived in India with the draft declaration on March 23. Briefly summarized, its proposals were as follows: (1) the creation of an Indian union constituting a dominion, associated with the United Kingdom and other dominions by a common allegiance with the crown, but equal to them in every respect; (2) the setting-up, immediately upon the cessation of hostilities, of a body elected by the provincial legislatures to frame a new constitution for India; (3) participation of the Indian states in the constitution-making body; (4) the right of any province of British India to retain its existing constitutional positions; (5) during the interim period, the responsibility for the defense of the country must rest with the British government, but the effective participation of Indian party leaders would be sought.

For the first time it was explicitly stated that the framing of the new constitution after the war was to be entirely a matter for Indians themselves, and that the goal was independence within or without the commonwealth. There was only a slight difference of opinion on the long-term proposals. But for the interim period it was stated that "H.M. government must inevitably bear the responsibility for, and retain control and direction of, the defense of India as part of the world war-effort," though "the task of organizing to the full the military, moral and material resources of India must be the responsibility of the government of India with the co-operation of the peoples of India. . . ." This failed to meet the demands of the Congress party, which insisted that the viceroy's executive council should be immediately replaced by a cabinet responsible to the legislature, in which the position of the

viceroy would be analagous to that of the king of England.

To this Sir Stafford replied that "were such a system to be introduced by convention under the existing circumstances, the nominated cabinet (nominated presumably by the major political organizations), responsible to no one but itself, could not be removed and would in fact constitute an absolute dictatorship of the minority. This suggestion would be rejected by all the minorities in India, since it would subject all of them to a permanent and autocratic majority in the cabinet. Nor would it be consistent with the pledges already given by H.M. government to protect the rights of these minorities . . . The proposals of H.M. government went as far as possible, short of a complete change in the constitution which is generally acknowledged as impracticable in the circumstances of the day." This was, of course, correct. The viceroy was responsible to the secretary of state and the British parliament, and could not divest himself of his powers without an act of parliament involving constitutional changes of a complicated and far-reaching character which were impracticable in the crisis of a great war.

On April 11 negotiations were broken off. But the offer still held. The prime minister stated in the house of commons that "the broad principles of the declaration made by H.M. government, which formed the basis of the mission of the lord privy seal to India, must be taken as representing the settled policy of the British crown and parliament. These principles stand in their full scope and integrity."

Congress Rebellion.-After this, the political situation rapidly deteriorated. On July 14 the Congress "high command" demanded the immediate abdication of British rule, though they were prepared to tolerate the presence of the troops of the United Nations as allies of a free India. This declaration was received by the other parties with dismay, and the government of India held its hand, hoping that wiser counsels would prevail. On Aug. 8, however, the All-India Congress committee endorsed the proceedings of the working committee, threatening to order mass civil disobedience in the event of noncompliance. This, in Mohandas K. Gandhi's own words, was nothing short of open rebellion. The viceroy's council, which now consisted of four British and seven Indians, had no alternative but to declare Congress an illegal association, and the members of the working committee were interned for the period of the war; Gandhi was arrested. In several cities serious disturbances broke out, the object of which was evidently to disrupt communications with the troops defending the Assam frontier. Railway stations and government offices were destroyed, telephone and telegraph wires cut, bridges damaged, and a number of government officials murdered. Order was not restored till the end of September, and military operations were gravely jeopardized. All other political parties dissociated themselves from the rising, which was mainly the work of agitators, and local in character.

India's War Effort.—Meanwhile, India as a whole was fully alive to its peril, and an army of 2,000,000 men, all volunteers and drawn from every class of the community, was enrolled. It was officered largely by Indians and constituted a truly national army, the largest volunteer force in history. No less remarkable was the war effort in other directions. India became the centre of the eastern supply group, supplying the munitions required, not only for itself but its Allies. In the early part of the North African campaign, it was solely responsible for the supply of pipe lines, rolling-stock and locomotives; even village industries were mobilized for making cotton cloth, blankets, camou-

flage netting and pith helmets. Hundreds of miles of pipe line for fuel were laid from Bengal to the Assam frontier; two hundred aerodromes were constructed, with bases for the American forces flying supplies over the "hump" to China. A network of roads and railway tracks was hacked out of the virgin jungle; 130 new hospitals were built and equipped with instruments and other appliances and drugs. The mills of Cawnpore and other places turned out immense quantities of uniforms and equipment, and all the supplies dropped over Burma were carried by Indianmade parachutes. Aircraft were assembled and supplied with accessories and spare parts at 18 centres. Government ordnance factories produced almost every kind of weapon required in modern warfare. Many types of craft required for coastal operations were built in Indian ports. The iron and steel works at Tatanagar and other places were working night and day.

All this meant the installation of new plants, the devising of new processes and the adaptation of old ones. Batches of skilled workmen were sent to England for training. This had an important influence upon the development of India's natural resources, the effect of which would be felt in the post-war years. The effect on the country's financial position was little short of revolutionary; against a debt of £350,000,000 in 1939, it held in Dec. 1945 sterling balances amounting to £811,000,000 and "balances held abroad" by the reserve bank, as security against deposits, of £416,000,000.

The tide of war was now beginning to turn in favour of the Allies. The great victories won by the U.S. navy at the Coral sea and Midway in May and June 1942 checked the Japanese advance in the Pacific, and Colonel Louis Johnson, President Roosevelt's personal envoy in India, announced the arrival of a huge convoy, including American troops and airmen, with up-to-date equipment and armaments. Preparations for taking the offensive went on steadily during 1943; meanwhile the Japanese menace to the Assam border was definitely arrested.

Lord Wavell Viceroy.-In Oct. 1943 Lord Linlithgow retired after holding office for seven and a half years; no viceroy since Lord Canning in 1857 had to face such a heavy load of responsibilities. He was succeeded by Field Marshal Lord Wavell, who had held the post of commander in chief, India, since March 1942. This experiment of appointing a serving soldier as viceroy was an unprecedented one; 40 years previously Lord Morley had vetoed the selection of Lord Kitchener. The departure of Lord Linlithgow synchronized with the outbreak of a disastrous famine in Bengal, the most serious since the beginning of the century. The primary cause was no doubt the cyclone of the previous year, which had destroyed the rice crop, drowned thousands of cattle, and put a large area temporarily out of cultivation. But there were subsidiary factors. The country had been denuded to feed the troops overseas, and Burma, the chief source of supply in peacetime, was now in Japanese hands. There were also grave errors of policy on the part of the local government, and a lack of co-ordination between the various provinces to secure an equitable distribution of food in times of scarcity. By December bands of starving peasants were invading Calcutta in search of food.

Lord Wavell took the matter promptly in hand, and with the co-operation of the military authorities food and medical supplies were rushed to the affected areas, where one of the worst obstacles was lack of communications. But it was impossible to prevent a terrible mortality, and 1,500,

ooo people died of hunger and epidemic disease. What was really needed, however, was a long-term policy to prevent a recurrence of the disaster. The real remedy was an all-round expansion of India's economic life, with special emphasis on the basic industries, agriculture, hydroelectric power and transport. With this end in view, Lord Wavell appointed Sir Ardeshir Dalal, a director of the Tata Steel Works, as the head of a new department of planning and development of the government of India.

It was recognized, however, that progress was impossible as long as the rate of literacy remained as low as 15% of the total population, and a post-war scheme to provide free and compulsory education for all children between 6 and 14 years, and secondary and university education for those able to benefit therefrom was worked out. A planned economy was essential in order to convert India from a land of undernourished peasants into a prosperous state, utilizing to the fullest capacity its vast material and human resources; but this was impossible as long as the best energies of the country were frittered away in sterile political controversy.

By the spring of 1944 the Allies were on the offensive on all fronts. The Indian troops in North Africa, side by side with their American, British and dominion comrades, took a leading part in driving the Italian and German forces out of Africa, and in the victorious Italian campaign which culminated in the surrender of the Germans at Caserta, April 29, 1945. The 14th army under General Slim, consisting of two British, three African and nine Indian divisions, fighting in the face of immense difficulties, drove the Japanese foot by foot out of Burma. Rangoon was retaken May 4, 1945. A general offensive by the South-East Asia Command under Admiral Lord Louis Mountbatten was forestalled by the Japanese surrender on Aug. 15. During World War II the Indian army had expanded from 189,000 with 1,115 Indian commissioned officers to 2,500,000 with 15,740 Indian officers. It had suffered 180,000 casualties (24,340 fatal) and had been awarded 31 Victoria Crosses.

The Royal Indian navy, Royal Indian air force and Women's auxiliary corps had rendered invaluable services. The Royal Indian navy had expanded from 1,200 to 30,000 men, and played a leading part in the evacuation of Burma, convoy duties and coastal operations. Its most notable exploit was that of the sloop "Bengal," armed with a twelve-pounder gun, which attacked two Japanese raiders armed with 5.5-in. guns, sank one and drove the other off. In 1942 the Royal Indian air force consisted of two squadrons. It ended the war with ten, the personnel being entirely Indian. They played a conspicuous part in the Burma campaign, dropping more than 1,000 tons of bombs on the Japanese forces, and large quantities of supplies by parachute for troops in the forward areas. The coastal defense wing did valuable work hunting for axis submarines and surface-raiders and on escort duties.

Post-War Situation.—After the time of his internment in the Aga Khan's palace at Poona, Gandhi carried on a correspondence with the viceroy, complaining of the injustice of the treatment meted out to himself and his colleagues. When it was pointed out that the disturbances of Aug. 1942 had involved grave consequences, he retorted that Congress was not responsible, or alternatively, that they were provoked by the "leonine violence" of the British government. Finally, he threatened to start another fast unless he and the members of the working committee were unconditionally released. This was the ninth occa-

sion on which Gandhi had resorted to this form of protest. But the viceroy stigmatized the threat as "political blackmail," and warned Gandhi that if he fasted, he alone would be responsible for the consequences. He was, however, willing to release him, provided that he dissociated himself from the resolution of Aug. 8, and the policy which that resolution represented. To this Gandhi was unable to agree and he announced that he would start a three weeks' fast on Feb. 10, 1943. Gandhi was now 73, and grave apprehensions were felt about his health. He was allowed to carry out his self-imposed penance at a friend's house, and the rule about visitors was relaxed Madheo Shrihari Aney, Chakravarthı R. Rajagopalacharı and other friends vainly tried to persuade him to abandon the project, and an appeal was made to Churchill. The fast was duly carried out, and ended on March 3. But Gandhi's health had suffered considerably, and he was unconditionally released in May 1944.

After this, events in the political field moved rapidly. It was recognized on all sides that no advance was possible without a Hindu-Moslem entente, and in September, by the good offices of Rajagopalachari a meeting in Bombay was arranged between Gandhi and Jinnah. Gandhi proposed that the Hindus and Moslems should unite to achieve independence, after which boundaries between the two Indias could be adjusted by mutual agreement. Jinnah replied that this was putting the cart before the horse; Pakistan must first be conceded. A nonparty conciliation committee called by the veteran liberal leader, Sir Tej Bahadur Sapru, did not fare much better. The report of the committee, which was published in April 1945, proposed that India should be declared a dominion by royal proclamation. The viceroy's council should be Indianized, and dyarchy at the centre abolished. An Indian federation should be set up without insisting on the accession of the states, but secession on the part of the provinces of British India should not be permitted. Political prisoners should be released, and parliamentary government restored in the provinces. A constitution-making body consisting of equal numbers of Hindus and Moslems should be set up.

The report, admirable in all respects, had a cool reception, and it was obvious that there was little prospect that its suggestions would be adopted. The next move lay with the government, and on March 25 Lord Wavell flew home for consultations with the cabinet. On June 14 a statement of policy was made in the house of commons by the secretary of state for India, L. S. Amery. He said that if the offer made by the British government were accepted all the portfolios on the viceroy's executive council except that of the war member, held by the Commander in Chief, would be transferred to Indian hands; this would include that of foreign affairs, hitherto held by the viceroy in person. In selecting his council, the viceroy would endeavour to secure a balanced representation of the main communities, including an equal proportion of Moslems and Hindus. The new executive would thus be representative of organized political opinion. If these proposals were agreed to, ministerial government would be resumed in the provinces and the members of the Congress Working committee who had been interned in August 1942 were to be released.

On his return, Lord Wavell called a round table conference at Simla on June 26, and the leaders of the various political groups were asked to submit lists from which he could choose the members of his executive council. The conference eventually broke down because Jinnah refused to submit a list of nominees without a guarantee that all Moslems selected should be members of the Moslem

File of native women workers at a U.S. airbase in India where, in 1944, they helped to enlarge the field to accommodate B-29 Superfortresses

league. On Aug. 25 Lord Wavell again went to London to consult with the new secretary of state for India, Lord Pethick-Lawrence, and the Labour government. On Dec. 4 Lord Pethick-Lawrence made a statement reaffirming the intention of the British government to promote with all possible urgency the attainment by India of the position of an independent partner in the commonwealth. After the elections the viceroy would discuss with representatives of the Indian legislatures and the states the appropriate methods to be followed in convening the constitution-making body. Responsible government in the provinces would be resumed, and the viceroy would take steps to bring into existence an executive council which would have the support of the main Indian parties.

The closing months of 1945 were marked by a growing impatience which manifested itself in widespread disturbances. Great excitement was caused by the court martial of members of the Japanese-sponsored "Indian national army" accused of the mal-treatment of sepoys who refused to go over to their side in Burma. Congress leaders maintained that they were national heroes, fighting for the freedom of India, and mass meetings were held to insist that they should not be punished. In Bombay and Calcutta this led to demonstrations in which shops were looted and Europeans attacked, and army lorries overturned and set on fire. An American soldier was killed by the mob. On Feb. 18, 1946, a mutiny broke out among units of the Royal Indian navy stationed at Bombay, Karachi and Calcutta. These events took place against a grim

background of famine in south India. India's shortage of lood grains was estimated at 7,700,000 short tons for 1946.

The elections for the central and provincial legislatures, the first held after Congress withdrew its ministries in 1939, were scheduled for the spring; these were of unusual importance, as upon the latter would devolve the task of choosing the members of the constitution-making body. The results in both were what was anticipated. Minor parties such as the Mahasabha were practically eliminated. In the provinces, Congress obtained majorities as before in 8 out of the 11, but with greatly increased numbers; they won 930 seats out of a total of 1,585, as compared with 704 in 1937, while the Moslem league won 428 Moslem seats as compared with 109 in 1937. In the central assembly Congress won 56 and the Moslem league 30 seats. In Bombay Congress captured 126 seats out of 175, and in the central provinces 92 out of 112. In the Punjab the Moslem league won 75 seats out of 175, Congress 51 seats, the Akali Sikhs 22, and Unionists and Independents 27; thus though the league was the strongest single party it was liable to be outvoted by a coalition of the other parties. In the central legislature the league won all the seats reserved for Moslems, and an overwhelming majority of Moslem seats in the provinces, except in the case of the North-West Frontier Province, which had always been pro-Congress. Thus Moslem opinion was solidly behind the league, and this constituted a mandate for Pakistan.

The Cabinet Mission.—Further efforts on the part of the viceroy to break down the deadlock having proved unavailing, it was announced that the government would send out a cabinet mission, consisting of Lord Pethick-

Lawrence, A. V. Alexander and Sir Stafford Cripps, in an endeavour to bring about such a measure of agreement between the Indian communities as would enable Indians to frame a constitution for themselves. Its functions were purely advisory. Having secured the necessary measure of agreement, it would retire, leaving the future in Indian hands.

The first discussions hinged on Pakistan, and, though the mission succeeded in bringing Jinnah and the Congress leaders together, no agreement was arrived at. The mission was therefore forced, on May 16, to issue proposals of its own, though these were in no sense an award. An interim government was to be set up at the centre, in which all portfolios, including that of war, would be held by Indians. A constitution-making body was then to be assembled which would draw up an Indian union, comprising British India and the states. Pakistan was rejected as incompatible with the defense of the country as well as on economic and administrative grounds, but the centre was to be a minimal one: it would be limited to defense, foreign affairs and communications, the union having the powers to raise the revenues necessary for these subjects. All residuary powers would be vested with the provinces, and it was further laid down that the provinces would have the additional right to form groups, with their own executives and legislatures, each group to determine the provincial subjects to be taken in common. Contiguous provinces such as the Punjab, Sind and the North-West Frontier Province in the northwest, and Assam and Bengal in the northeast, could thus form themselves into autonomous groups of states; by this ingenious device it was hoped to preserve the unity of India while ensuring for the Moslems the substance of Pakistan. Moreover, the rights of the minorities were safeguarded. The Indian states would retain all rights and powers other than those ceded to the union. Matters arising out of the transfer of power would be dealt with by a treaty negotiated between the United Kingdom and the constituent assembly.

The mission returned to England on June 29. It had succeeded in obtaining the agreement of Congress and the league to a long-term plan for a constitution based on three separate groups of provinces with a minimal centre; but it had failed to secure the concurrence of the two political parties to an interim government, and the viceroy was compelled to set up a stop-gap executive council composed of eight officials, six British and two Indian.

Constituent Assembly.—On July 25, 1946, results of the elections to the constituent assembly were announced. Out of a total of 210 seats allotted to general constituencies the Congress party won 201, while the Moslem league captured 73 out of the 78 Moslem seats, the remaining five going to prominent Congress Moslems. The four Sikh seats remained for the time unfilled, owing to the boycott of the elections by that community, but 25 representatives of the depressed class, 7 Christians, 3 Anglo-Indians and 12 women were included in the majority, and in addition a number of eminent nonparty men were elected. Ninety-three seats remained to be filled by the Indian states, but it was plain that Congress would dominate the assembly whatever happened.

Nehru told a press conference that "what we do there, we are entirely and absolutely free to determine; we have committed ourselves on no single matter to anybody." As regards the grouping of the provinces, which the Moslems considered vital to their interests, he predicted that the North-West Frontier Province would refuse to be grouped

"What a Time to Cast Off!" Shoemaker of the Chicago Daily News was skeptical of the timing in Prime Minister Attlee's offer of Indian independence, made in the house of commons on March 15, 1946

with the Punjab, and Assam would decline to throw in its lot with Bengal. These utterances Jinnah characterized as "a complete repudiation of the basic form on which the long-term scheme rested."

On July 29 the Moslem league formally reversed its decision of June 6, accepting the cabinet mission's long-term plan. In the light of the fact that no checks save "the secretary of state's pious hope" existed to prevent the constituent assembly from taking by brute force majority decisions repugnant to the letter and spirit of the scheme, the resolution stated that conditions precedent for the successful working of a constitution-making body did not exist. It therefore demanded the rejection of the plan and the adoption of direct action. Aug. 16 was proclaimed as "direct action day." In most Indian cities it passed off quietly, but in Calcutta it was the signal for a battle royal between the contending factions, which raged for four days before it was taken in hand by the police and military; 3,500 people were killed, while looting and arson were widespread; the damage done to property was estimated at more than £1,000,000.

Interim Government.—On Aug. 25, 1946, the viceroy announced the names of the new interim government. They included Nehru, Sardar Vallabhai Patel and Rajagopalachari and two other prominent Congress men, representatives of the Sikhs, Christians and depressed classes, three Moslems and a Parsee. At the same time Lord Wavell broadcast a message in which he stated that, as soon as the league agreed to co-operate, five seats, which would ensure complete parity with the caste Hindus among the Congress party-representatives, would be placed at Jinnah's disposal. He added that the Moslem league need have no fear that it would be outvoted on any essential; he would make it his business to see that the most important portfolios were equitably shared.

The new government with Nehru as chief minister, assumed office on Sept. 1 and held its first formal meeting

under the presidency of the viceroy at Delhi four days later. The tasks confronting it were heavy. First and foremost, there was the question of communal accord, which could only be achieved by coming to terms with the Moslem league on the subject of representation in the central government; secondly, the need for energetic measures for averting the threatened famine; thirdly, the settlement of the 2,000,000 demobilized soldiers in civilian occupations; and lastly, steps to combat the growth of communist agitation among the unskilled labouring classes.

Nehru, in his first broadcast from Delhi as chief minister of India's interim government, declared that the Indian Congress party would go to the constituent assembly determined to find a common basis of agreement on all common issues. He invited those who differed from Congress to enter the assembly as equals and partners. An urgent and vital task was to conquer the spirit of discord which was abroad in India; out of mutual conflict they would never build the house of India's freedom.

Turning to foreign policy, Nehru said that an independent India would have friendly and co-operative relations with Great Britain and the nations of the British commonwealth, but it was well to remember what was taking place in one part of the commonwealth: in South Africa racialism was a state doctrine, and the Indian people were putting up a heroic struggle against the tyranny of a racial minority. The future was bound to see a closer union between India and southeast Asia on the one hand, and Afghanistan, Iran and the Arab world on the other. India would take part in international conferences as a free nation and not as a satellite power.

On Oct. 5, by the good offices of the nawab of Bhopal, chancellor of the chamber of princes, a meeting was arranged between Jinnah and Nehru, and ten days later it was announced that the viceroy's offer had been accepted by the league. Three members of the cabinet resigned to make way for the newcomers, who included Liaquat Ali Khan, Jinnah's right-hand man. Surprisingly one of the league nominees was Jogendra Nath Mandal, the Bengal depressed classes leader. It was announced at the same

Followers of Subhas Chandra Bose, organizer for Japan of an Indian National army, in armed conflict with Bombay police during festivities honouring Bose's birthday in Jan. 1946. Anti-British rioting and violence continued for three days

time that Acharya Kirpalani succeeded Nehru as president of the Indian National congress.

The opening of the constituent assembly was fixed for Dec. 9, but a fresh difficulty arose over the interpretation of the cabinet mission's plan for forming India into legislative groups. The Moslem league insisted that the group should vote on the subject as a whole, while the Congress party contended that each province should vote separately whether it should or should not enter a group. The latter view, if upheld, would completely disrupt the plan, for while the Moslems hold an over-all majority in North-West and North-East India, they do not enjoy a majority in each individual province. Jinnah announced that unless the former view were upheld the Moslem league would boycott the constituent assembly. A conference of the Moslem league and Congress leaders and the viceroy with the British cabinet was called to London in a last-minute attempt to save the situation. It was fruitless, and the members separated on Dec. 6 without reaching a conclusion. The constituent assembly opened three days later without the presence of representatives of the Moslem league or the Indian states. Nehru announced that the object of the assembly would be to establish a sovereign Indian republic. (See also Burma; Famines; World War II.)

The Indian States.—The question of the repercussions of the above described events upon the position of the Indian states was an important and interesting one. Within their borders, the larger states exercised sovereign powers. But they had no external existence; they could not wage war or make treaties or engagements with their neighbours. In return, the crown undertook to maintain their territorial integrity, protect them from external aggression and internal disturbances, and maintain the dynasty and continuation of the rights and privileges of the rulers.

The idea of a federal India had been adumbrated in the report of the Simon commission, and had been cautiously welcomed by the then chancellor, the maharaja of Bikanir, though the Butler commission expressed the opinion that, in view of the historic relation between the paramount power and the princes, the latter should not be transferred without their agreement to a relationship with

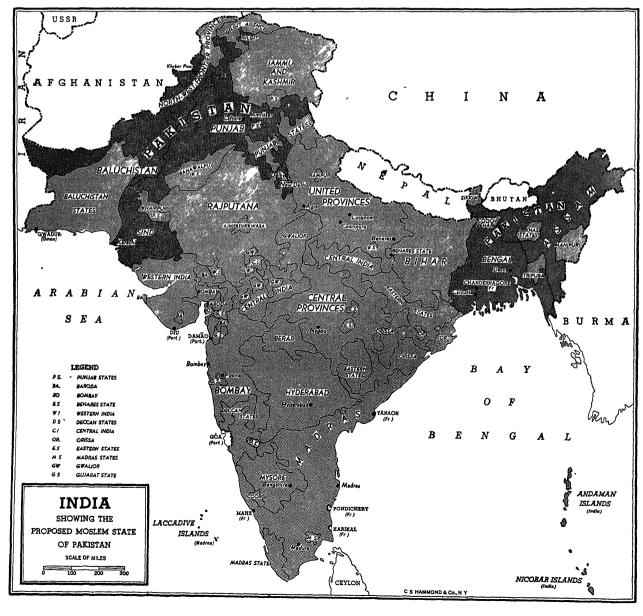

a new government in India responsible to an Indian legislature. A federal India constituted on these lines was an integral part of the Government of India act, 1935. The states were to nominate 125 out of the 375 members of the legislative assembly, and 104 out of 206 members of the council of state. It was laid down that the federal part of the act was not to come into force until the rulers of half the total population of the states had signed the instrument of accession. As mentioned above, this never took place. In some states, serious trouble had arisen from agitation fomented by members of the Indian National Congress, and the requisite number of princes were unable to agree to the diminution of their powers which would necessarily be involved. Indian nationalists, on the other hand, raised objections to a scheme which would place the casting vote in the hands of "palace nominees." This was the state of affairs when war broke out, and the federal portion of the act was suspended.

In World War II, as in World War I, the Indian princes placed the whole of their resources in men and money at the service of the king emperor, and many of them went to

the front. The states' subjects under arms numbered 250,000, and 16 battalions of the states forces were on active service, as well as many transport, signal and pioneer companies. The nizam of Hyderabad, the premier Indian state, raised and equipped 8,000 men, gave £170,000 for a corvette for the Royal Indian Navy, and a further large sum for an R.A.F. bomber flight. Other states followed his example.

It was obvious that if the princes were to survive, it could only be as constitutional rulers. Progressive princes realized that the association of their subjects in the government through parliamentary and local bodies was imperative, and Travancore, Mysore, Cochin and Baroda introduced effective representative institutions, an independent judiciary and the separation of the privy purse of the ruler from the expenditure of the state. Another question to be considered was that of grouping. There were 562 states in India, ranging in size from Hyderabad and Kashmir, as large as Great Britain, to tiny holdings of a few square miles. It was proposed in 1943 to group the latter into larger units, but legal difficulties intervened. Sooner or later, however, something would have to be done. Without the pooling of resources, they would be

unable to face the problems of modern administration; the duplication of administrative machinery involved a large and unnecessary waste of money.

The Cripps offer of 1942, which envisaged the framing of an Indian constitution by Indians themselves, necessarily involved the question of paramountcy. If India decided to leave the British commonwealth. paramountcy would automatically disappear. In a memorandum presented to the nawab of Bhopal, chancellor of the chamber of princes, by the cabinet mission, it was stated that no change in the relationship of the states with the crown or the rights guaranteed by their treaties would be initiated without their consent. Paramountcy would be continued during the interim period, and would in no circumstances be transferred to an Indian government. During period the states would conduct negotiations with British India in regard to the future regulation of matters of common concern. When a new, fully

self-governing or independent government came into being in British India, the British government's influence would not be such as to enable them to carry out the obligations of paramountcy. All the rights surrendered by the states to the paramount power would return to the states. The void would have to be filled either by the states entering into federal relationship with the successor government, or failing that, entering into particular political arrangements with it. On behalf of the standing committee of the chamber of princes, the nawab of Bhopal welcomed the proposals as providing the necessary machinery for the attainment of independence. A negotiating committee as envisaged by the mission would be set up at the viceroy's invitation, and would consist of three princes and seven state ministers. It was provided that 90 seats on the constituent assembly should be allotted to the states, but the manner of their selection was not settled.

"Hoosier." The total area of the state is 36,519 sq.mi., including 314 sq.mi. of water. Pop. in 1940 was 3,427,796; of which 55.1% was urban and 44.9% was rural. Of the total, 93.2% were native white, 3.2% foreign-born white and 3.6% Negro. Est. population in 1945 was 3,743,328. Capital and largest city, Indianapolis, had a population (1940) of 386,972. Other cities: Fort Wayne (118,410); Gary (111,719); South Bend (101,268); Evansville (97,062); Hammond (70,184); Terre Haute (62,693); East Chicago (54,637); Muncie (49,720); Anderson (41,572).

In 1937, under Gov. M. Clifford Townsend, Democrat, departments of public welfare were established for both the state and the counties, with personnel selected by the merit system. The state distribution to public school teachers, also, was increased to \$700 annually for each teaching unit. A federal homestead settlement at Decatur and a federal housing project for Negroes in Indianapolis were completed during the year, and with federal government co-operation old-age pensions were initiated, unemployment compensation was provided for and other public welfare and social security measures were effected.

In the Nov. 1938 election the Republicans won a majority (51 out of 100) in the house; the Democratic party retained control of the senate. Control of the 81st general assembly was divided. All state officials and judges elected were Democrats except for the secretary of state, a post won by James M. Tucker, Republican. Seven of the 12 U.S. representatives elected, however, were Republican. Politically significant, also, was the opening of the cam-

paign of former governor Paul V. McNutt, high commissioner of the Philippine Islands, for the Democratic nomination for president of the United States in 1940.

In 1939, the general assembly met from Jan. 5 to March 6; principal legislation passed and approved during the year was the revision of the liquor laws (abolishing ports-of-entry and their import fees).

In the Nov. 1940 election, Wendell L. Willkie, native-born Republican candidate for president, carried the state by a vote of 899,466 to 874,063. Henry F. Schricker, Democrat, was elected governor by a vote of 889,620 to 885,657. Other elected officials, all Republican, were: Charles M. Dawson, lieutenant governor; James M. Tucker, secretary of state; Richard T. James, auditor; James M. Givens, treasurer; Clement T. Malan, superintendent of public instruction. The Republican party secured a majority in the senate and added to its majority in the house of representatives; one Republican was elected to the supreme court and two to the appellate court, although both courts retained Democratic majorities. Raymond E. Willis (Rep.), was elected to the seat in the U.S. senate held by Sherman Minton (Dem).

In 1941, the major political development was the struggle between the Republican controlled general assembly, in session from Jan. 9 to March 10, and Democratic Gov. Henry F. Schricker, for the control of the state government and the appointment of state personnel. The assembly repealed the executive-administrative act of 1933 which granted the governor complete appointive power, and gave him centralized authority on many other matters. It passed bills over the governor's veto, establishing boards made up of the governor and two (Rep.) elected officials with appointive and administrative authority over the various administrative offices and institutions of the state. Gov. Schricker sought and obtained a judicial injunction against further action by these boards, and after much litigation the state supreme court declared most of the legislation unconstitutional and reaffirmed the appointive authority of the governor. In the exercise of this authority Gov. Schricker gave consideration to recommendations of heads of state institutions and, for political appointments, to the recommendations of the Democratic state committee -the general practice before the system of highly centralized authority was established in 1933. On March 8, 1941, the state personnel act became a law, without the governor's approval, providing for a merit system in the department of public welfare, the state institutions, the state board of health and several other agencies.

In the Nov. 1942 elections, the following state officers, all Republicans, were elected: Rue Alexander, secretary of state; Richard T. James, auditor; James M. Givens, treasurer; C. T. Malan, superintendent of public instruction. Republicans also gained one seat on the supreme court, four on the appellate court and the office of the attorney general. The supreme court for 1943 was to include 3 Democrats and 2 Republicans, the appellate court would be wholly Republican. For the general assembly, 82 Republicans and 10 Democrats were elected to the house and 23 Republicans and 5 Democrats were elected to the senate. For congress the state elected 9 Republicans and 2 Democrats, and the state lost one representative under the apportionment law based on the 1940 census.

The 83rd general assembly was in session from Jan. 7 to March 8, 1943. A law identical with one passed by the Kentucky legislative body and later enacted by congress

defined the state boundary along the Ohio river so that it would include in Indiana the site of the Evansville water works, which Kentucky had claimed and against which it had levied taxes. Twelve interim commissions were established to codify laws, investigate conditions and locate institutions. An important act passed during the year was that fixing financial responsibility for operators of motor vehicles. Improvements were made in the investment of the common school fund, and needed regulation was instituted covering nursing homes for the aged, many of which sprang up after the establishment of oldage pensions; they were required to obtain licences and comply with reasonable specifications. The state personnel board, which placed many of the state departments and institutions on a merit system, was abolished and an almost identical act re-enacted with the object of changing the membership of the board-the board had been at odds with many state officers and institutions. (C. B. C.; X.)

State officers elected in 1944 were: Ralph F. Gates, governor; Richard T. James, lieutenant governor; Rue J. Alexander, secretary of state; A. V. Burch, auditor; James A. Emmert, attorney general; Clement T. Malan, superintendent of public instruction. Two special sessions of the 83rd general assembly were held during 1944. The first, April 11-14, amended the election laws to facilitate voting by the armed services. The second, held on Nov. 4, extended the voting hours at the polls. After the death of Frederick Van Nuys, Republican, Samuel D. Jackson, Democrat, was appointed U.S. senator and served from Jan. 28 until the election in November of William Jenner (Rep.) who served until the end of the session. Homer E. Capehart (Rep.) was elected for a four-year term. In the 1944 presidential election Thomas E. Dewey received 875,-891 votes and Pres. Roosevelt received 781,403.

The 84th general assembly met in regular session from Jan. 4 to March 5, 1945. It made provision for a flood control commission, a veterans' affairs commission, an aeronautics commission, the establishment of the Northern Indiana hospital for treatment of mental disorders and appropriation for additional buildings on the site of the Indiana War memorial for use as national headquarters of the American Legion; it also established a public employees' retirement fund.

Indians, American

The Indian Reorganization (Wheeler-Howard) act of 1934 had provided the machinery by which political and economic self-government might be restored to the Indian tribes of the United States. The act, which was extended to cover the natives of Alaska and in part to Indians in Oklahoma in 1936, contained a provision specifying that it would not apply to any reservation wherein a majority of the adult Indians voted against its application. Of approximately 300 recognized tribes, bands, or pueblos within the continental U.S., 181 voted to avail themselves of the advantages of the act, which was applied to 14 additional groups who did not hold elections to vote on its application. Ninety-two groups, representing 128,-750 Indians, had adopted constitutions by 1946, and 72 had completed organization by ratifying charters permitting them to operate as business corporations. Seventyseven groups representing 86,365 Indians, of which about half belonged to the Navaho tribe (45,000 in 1934), rejected the act.

The tribal constitutions took many forms. Some were

adaptations of earlier organizations. Some merged the old and new forms to provide for a modern council and at the same time invested the chieftains with some power Others were organized much like a rural U.S. town. Under the charters the tribe was competent to make contracts, sign documents with its corporate seal, sue and be sued in courts of competent jurisdiction, purchase, take by gift, bequest or otherwise, or hold, manage, operate and dispose of property of every description, real and personal, including the power to purchase restricted Indian lands, and to issue in exchange therefor interest in corporate property. This exercise of corporate authority was limited by specific prohibition against any sale, mortgage or lease, for more than ten years, of any land within the reservation boundaries. These constitutions, by-laws and charters did not interfere with the pursuit by members of their own private objectives except in such ways and to such an extent as the members themselves had agreed. They did not affect allotment rights. The tribal council could deal only with the property of the tribe as a whole, not that of individual members. During the first decade of operation under these instruments, many of the council actions were subject to review or veto by the secretary of the interior. Many of the documents, however, carried specific provisions permitting the restriction or termination of secretarial supervision by action of the tribe or of the secretary of the interior, at the expiration of specified training periods.

The Indian Reorganization act provided a number of advantages which might be shared by organized tribes, such as access to a federal loan fund established by the act (\$10,000,000 authorized; \$6,599,600 appropriated); educational loans to permit qualified young Indians to pursue higher education; the restoration of much ceded land to the tribes; and the purchase of new lands for Indian tribes through the use of either federal or tribal funds. The act also reversed the 50-year-old policy of allotting Indian lands to individuals and stopped the sale of individual Indian lands, except in extreme emergencies. Under the credit provisions, loans were made to Indian tribes which in turn set up loan boards authorized to loan to individual members and to organized groups within the tribe.

The operations of the act served to arouse the initiative of many tribes which had sunk into apathy under previous governmental controls. While federal trusteeship of Indian lands was not terminated, and the responsibility for many phases of reservation administration was still vested by law in the reservation superintendent and his associates, increasing responsibility for administration of tribal assets was being shared by these officials with elected representatives of the tribes.

Efforts to Preserve Land Titles.-Where the operation of inheritance laws resulted in the fractionalization of Indian allotments, tribal councils made various proposals by which these fractionated acreages could be acquired by the tribe, rather than sold to non-Indians. This tribal land was consolidated and assigned to landless Indians, subject to cancellation for nonuse. Fear that these proposals only disguised a new attempt to divest Indians of their land delayed acceptance by individual Indians. After 1940, steps toward solution of the land problem moved more rapidly. All of the Jicarilla Apaches returned their allotments to the tribe in exchange for assignments. Progress was made among the Rosebud Sioux in the transfer of fractionated allotments to the tribe in exchange for certificates which could be used to obtain integrated assignments. Action began on the Colorado River reservation

Choctaw delegate from Oklahoma shaking hands with Pres. Truman, who had just approved the bill creating a commission to hear Indian land claims. The bill was signed on Aug. 13, 1946

looking toward the same solution.

Under authority of the act, the secretary of the interior returned substantial acreages of ceded lands to the Colorado River tribes in Arizona, the Wind River Shoshone tribe in Wyoming, the Consolidated Ute tribes in Colorado, the Umatillas in Oregon, the Blackfeet and Flathead tribes in Montana, the Fort Berthold and Standing Rock Indians in North Dakota, the Pine Ridge, Rosebud and Chéyenne River tribes in South Dakota, the Uintah and Ouray tribes in Utah, the Kiowa, Comanche and Apache tribes in Oklahoma, and a few others.

Many chartered tribes undertook the commercial development of their resources to provide employment, utilizing the proceeds for the further development of tribal property. For example, the Consolidated Kootenai (Kootenay) and Salish tribes of the Flathead reservation in Montana planned to invest almost \$500,000 derived from tribal electric power in the development of medicinal hot springs. The Blackfeet Indians of Montana began to loan the income from tribal oil leases to individual members of the tribe for the acquisition of livestock. The Metlakatla Indians in southeast Alaska used the income from a tribal cannery to develop hydroelectric power and other public improvements.

Claims Commission Authorized.—One of the basic problems recognized by the U.S. Indian service was that of Indian claims. Through the years, many injustices had been worked against Indian tribes through the failure of the federal government to carry out agreements arrived at through negotiated treaties. Between 1820 and 1850, most of the eastern Indian tribes had been removed from their aboriginal homes to new areas west of the Mississippi to which they were guaranteed permanent title. In many instances, they were transferred a second time until a majority were concentrated within the boundaries of the state of Oklahoma. The western tribes were persuaded to confine their activities to portions of their former ranges, which were then reserved for their exclusive use. In connection with these various removals and the establishment of reserves, the rights of many tribes were ignored or there were serious delays in complying with agreements. As examples:

- (1) During the forty-niners' gold rush to California, the Indians were driven from the valleys and dispossessed of their lands. Some 18 California tribes entered into treaties with representatives of the federal government for the sale or exchange of lands. These treaties were never ratified by the senate, and the claims dragged through the years.
- (2) When the Sioux Indians of the Dakotas stopped raiding the immigrant trains, they were promised a reservation area incorporating most of the state of South Dakota, including the Black Hills. Almost before the ink on the treaty was dry, gold was discovered in the Black Hills and the rights of the Indians were violated by white men who rushed to the scene. The Sioux Indians claimed

compensation for the loss of the Black Hills.

(3) When the Klamath reservation was set aside, part of the timber lands were sold to whites as the result of a surveyor's mistake in fixing the boundary.

A long and complicated process heretofore had faced any Indian group desiring to have its claims adjudicated. It was first necessary to obtain the passage of a jurisdictional bill by congress permitting the tribe to file suit in the court of claims against the federal government and specifying the general bases of the suit. Frequently when the cases came to trial, the jurisdictional acts were found to be inadequate, and an entire case might have to be started over again.

Despite these difficulties, the decade 1937-46 saw a number of substantial claims suits decided in favour of the Indians. In 1937, the court of claims awarded \$5,468,209.48 to the Klamath Indians in Oregon because of the erroneous boundary survey. In the same year, the court awarded the Wind River Shoshone a judgment in the amount of \$4,494,906.41, because the army in 1878 had settled a group of Northern Arapahoe on the eastern end of their reservation in Wyoming without consulting the Shoshones. In 1944, a suit of the California Indians resulted in a judgment awarding certain of these Indians \$5,024,842.34.

Unsettled claims, however, continued to cause unrest among the Indians. In a report to the house of representatives on Dec. 23, 1944, a select committee of the house committee on Indian affairs made a proposal that an Indian claims commission be established by congress and empowered to settle all the disputes. A bill to create an Indian claims commission and to provide for the powers, duties and functions thereof was enacted by congress and signed by President Truman on Aug. 13, 1946.

Inter-American Indian Institute.-On April 24, 1940, representatives of 19 of the 21 American republics met at Patzcuaro, Mexico, for the first Inter-American Conference on Indian Life. Canada was the only nation with an appreciable Indian population which was not represented. Consideration was given to the social, political, educational and physical welfare of the 30,000,000 Indian inhabitants of the western hemisphere. The conference recommended establishment of a permanent Inter-American Indian institute, and recommended that its permanent headquarters be in Mexico City. It also recommended the establishment of national Indian institutes in the affiliated nations. The convention came into force during Oct. 1941, after ratification by Mexico, Honduras, El Salvador, the U.S. and Ecuador. Bolivia, Colombia, Nicaragua, Panamá and the Dominican Republic later adhered to the convention. Ratification by the U.S. automatically provided for the establishment of a National Indian institute, financed during its first two years by funds provided through the Office of the Coordinator of Inter-American Affairs. On July 1, 1944, the institute lapsed through failure by congress to provide funds for its continuance. By order of Secretary of the Interior Ickes in 1945, the National Indian institute was transferred to the Institute of Ethnic Affairs, a private agency organized to promote on an international scale the interests of minority groups.

Native Land Rights in Alaska.—Although the department of the interior was instructed by congress in 1884 to take steps to examine and report on the condition of the natives of Alaska, "what lands if any should be reserved for their use," etc., no definite steps had been taken in

this direction until the passage in 1936 of the Alaska act which authorized the secretary of the interior to set aside as reservations, subject to ratification by the native groups, the lands occupied and used by these natives. In 1944, the secretary of the interior approved the establishment of 80 such reserves of various sizes in northern Alaska.

Under the law of June 6, 1924, as amended, the secretary of the interior also was vested with authority to promulgate regulations covering fishing in public waters of Alaska. The regulations issued by the secretary in 1942 contained a paragraph forbidding the establishment of traps "in any site in which any Alaska native or natives has or have any rights of fishery, by virtue of any grant or by virtue of aboriginal occupancy." The natives were permitted to petition the secretary for a hearing with regard to any aboriginal claims. The department authorized hearings in the fall of 1944 in various locations in southeastern Alaska from which native petitions had been received. These petitions provoked bitter opposition from commercial canneries, which claimed that the satisfaction of such native rights would destroy the canning industry in southeastern Alaska. The secretary appointed Richard H. Hanna, former chief justice of the supreme court of New Mexico, to preside at the hearings. In his decision based on the hearings, the secretary of the interior held that the lands in southeastern Alaska to which these native villages could establish aboriginal rights were exceedingly limited. The conflict created by the fisheries dispute halted the confirmation of native title to much of the land used and occupied by natives elsewhere in the territory.

Schools and Hospitals.—In 1946, there were 34,702 U.S. Indian children between the ages of 6 and 18 years enrolled in public schools with their white neighbours; 16,631 children attended federal day schools on reservations, where there were few whites; and 11,198 attended federal boarding schools. Mission and private schools enrolled 7,436. The federal government operated 256 boarding or day schools for Indians, and the number of high schools had been increased to 40. In Alaska approximately 2,000 native children were in territorial schools, 5,200 in federal schools, and about 650 in private or mission schools. The federal government operated 115 day schools and three boarding high schools in Alaska. The 1947 Interior Department Appropriation act authorized the transfer of the Sitka naval base to the Indian service, to be converted into a fourth Alaska native boarding vocational high school for about 600 children. There were still about 20,000 Indian children in the U.S. and about 2,600 in Alaska without school facilities.

The seven native hospitals in Alaska with an aggregate capacity of 324 beds were to be augmented by the erection of a 200-bed tuberculosis sanatorium at Sitka. The Indian service operated 67 hospitals and sanatoria in the U.S., with a total of 3,677 beds. During World War II, 14 hospitals were closed because of opportunity for Indians to obtain better medical attention elsewhere and, in some instances, because of a lack of personnel.

Navaho School and Economic Problems.—During 1945 and 1946, considerable concern was aroused by the continued failure of the federal government to meet its treaty obligations to the Navaho Indians of Arizona and New Mexico. By the treaty of 1868, the government had agreed to provide a classroom and a teacher for every 30 children of school age. In 1946 there were 55,000 Navahos, of whom at least 20,000 were children of school age. The federal government provided and operated school facilities for approximately 5,500 of these children; the Indians

the remaining 14,500.

With the return of Navaho veterans of World War II to the reservation, the absence of school facilities for these Indians was brought to the attention of the white citizens of Arizona and New Mexico, and a concerted drive was inaugurated to force the government to comply with its treaty agreement. The entire tribal council visited Washington, D.C., during the spring of 1946 to bring the matter to the attention of President Truman, congress, the bureau of the budget, and the secretary of the interior. As a result, the Interior Department Appropriation act for 1947 was amended to include an appropriation to begin the reconstruction and enlargement of two of the older boarding schools which were fast becoming obsolete.

The Navaho tribe grew more rapidly than any other group in the U.S. Reports indicated that there were about 8,000 at the time of their imprisonment at Bosque Redondo in New Mexico, when the resistance of the tribe to the U.S. finally terminated. After the signing of their treaty with the federal government, the Navaho tribe was returned to its home lands and given sheep.

The 25,000 square miles of desert land set aside as the tribe's reservation proved inadequate to support the increasing numbers of Indians and Indian livestock. As a result, a serious overgrazing produced both wind and water erosion, and a continuing decrease in forage. From 1933 to 1940, the soil conservation service of the department of agriculture co-operated with the Indian service to effect a substantial reduction in livestock with a view to removing nonproductive sheep, goats and horses, restoring grass cover to the denuded lands.

The necessary stock reduction at last was practically accomplished, with the result that the remaining sheep were better fed and produced more wool and heavier lambs, producing a cash income greater than that previously received by the Indians from this source. The economic plight of the Navaho, however, was yet to be relieved, for it was estimated that even under most careful management, the resources of the reservation and the lands off the reservation occupied by Navaho Indians could not adequately support more than 35,000 people. The government sought to provide irrigated farms by the diversion of the waters of the San Juan river, to provide farming lands for some 10,000. The Navahos were encouraged to increase the quantity and quality of their jewellery and weaving, and a study was made of other types of industrial development which might be instituted in the reservation area to give employment to additional thousands. The Indians were also given every encouragement to find wage employment off the reservation.

One of the biggest barriers to a constructive solution of the Navaho problem was the fact that less than 40% of these Indians were English-speaking and less than 10% literate in English. As the Navaho language had never been written, it was exceedingly difficult to communicate with a very large proportion of the population. In 1937, at the instance of Commissioner John Collier of the Indian service, Dr. John Harrington of the Smithsonian institution collaborated with Oliver La Farge, the wellknown author, in the development of a Navaho alphabet which might be written on the typewriter or set on a linotype, with a minimum of diacriticals. With the groundwork thus supplied, Robert W. Young, a specialist in Navaho linguistics, was employed by the Indian service to develop text materials in Navaho and to inaugurate the teaching of reading and writing of Navaho to both English-speaking and non-English-speaking Indians. Prior to World War II, more than 800 Indians had been taught to read and write their own language. During the war this skill was found to be of great value (see below). Later, Protestant missionaries on the reservation also adopted the Harrington-La Farge alphabet.

Colorado River Development.-The Appropriation act for 1865 contained a provision setting aside land near Parker on the Colorado river, as a reservation "for the Indians of the Colorado river and its tributaries." Between 1867 and 1870, efforts were made to provide gravity irrigation water for this reservation. Several attempts failed. In 1898, a centrifugal pump driven by a steam engine was installed in an attempt to supply irrigation water during the low stages of the river, and a complete pumping installation was finished in 1912, which brought about 5,000 acres under ditch. Operation of this plant with various improvements was continued until 1941. With the completion of Boulder dam, the waters of the Colorado river were regulated, and in 1937 congress appropriated funds for the erection of a diversion dam at Headgate Rock above Parker, Ariz. This dam was completed in 1941, and a main canal was begun which would ultimately lead to the subjugation of approximately 100,000 acres. The Mohave and Chemehuevi Indians composing the Colorado river tribes numbered about 800. As the irrigable land on their reservation was far in excess of what these Indians themselves could use, it was proposed that they reserve approximately 25,000 acres for their own use, and make the remainder available to landless Indians of other tribes "of the Colorado river and its tributaries" as originally contemplated by congress.

With the outbreak of World War II, the extension of the main canal and the subjugation of land was stopped. In 1942, the central portion of the Colorado River reservation was selected as one of the larger war relocation centres for the Japanese evacuated from California, and the subjugation of 2,000 acres of Colorado river land and the extension of canals and laterals were carried on as a part of a project to make the evacuees self-supporting. On Jan. 1, 1945, the War Relocation authority notified the Indian service of its plan to evacuate the entire area during that year, and promised to return this irrigable land to the Indian service at intervals during the year. In the light of this announcement, the tribal council of the Colorado river tribes passed an ordinance on Feb. 3, 1945, setting aside the lower two-thirds of the reservation for colonization by other Arizona Indians. On Sept. 1 of that year the first group of 16 Hopi families from the barren mesas of northern Arizona accepted the invitation, and moved to Colorado river irrigated lands. Beginning somewhat slowly after the close of the war, appropriations were made again for the subjugation of this land. Plans were laid to settle ultimately as many families of Hopi, Navaho, Papago, and other landless southwest Indians as possible in this area.

Other Developments of the Decade.—Research by the health division of the office of Indian affairs over a period of years resulted in the announcement in 1938 that trachoma is a virus disease. The following year, Dr. Fred Loe, senior physician on the Rosebud Indian reservation, announced that sulfanilamide had proved an effective agent for arresting the disease. Further work with the sulfa drugs established sulfanilamide as a specific, but proved neoprontosil to be less toxic to many individuals. Through the use of the new sulfa drugs, trachoma was almost eliminated from the northern reservations, where the

Indians were of easier access. Progress was also made on the Navaho reservation, where it was estimated that some 40% of the Indians had been infected.

In 1941, the committee on human development of the University of Chicago, under an arrangement with the office of Indian affairs, undertook a study of Indian personality development as influenced by education. Several years of field study by a group of anthropologists and psychologists working with field employees of the Indian service, resulted in a series of valuable reports. The first volume of findings, The Hopi Way, by Dr. Laura Thompson and Dr. Alice Joseph, was published late in 1944. The second volume, Warriors Without Weapons, by Dr. Gordon MacGregor, was published in 1945 by the University of Chicago press. Two volumes dealing with the Indians of the Navaho reservation by Dr. Clyde Kluckhohn of Harvard university and associates, was printed by the Harvard University press. A fourth volume dealing with the Papago was to be published by the University.of

Approximately 25,000 Indian men and women served in the U.S. armed forces during World War II, and some 40,000 Indians left the reservations to engage in war work. No discrimination with respect to Indians was practised by any branch of the service, and many Indians won commendation with the Army, Navy and marine corps. Two Indians received the congressional medal of honour for outstanding bravery, 72 Indians received the air medal, 35 the distinguished flying cross, 52 the silver star, 53 the bronze star medal, four the distinguished service cross and three the soldier's medal. A group of approximately 300 Navaho Indians especially distinguished themselves using their native language as code talkers with the marine corps in the Pacific.

One of the few groups of Americans to be displaced because of hostilities was the Aleuts west of Dutch Harbor, Alaska. Approximately 54 Aleuts and two employees of the Indian service were captured by the Japanese during the attack on Attu. Thereafter, the remaining Aleut villages were transferred to the mainland in southwestern Alaska, where they remained until 1944. Many of the Attu Aleuts died in captivity. Those repatriated joined the village of Atka about 400 miles east of their former remote outpost.

Representatives of more than 50 tribes, bands or groups of Indians from 27 states, met at Denver on Nov. 15, 1944, to organize the National Congress of the American Indian. They united in agreeing that there was a variety of common interests which could be served by such an organization having no official connection with the Indian service. The organization undertook numerous activities on behalf of the various Indian groups.

In Aug. 1942, the office of Indian affairs was one of several civilian agencies moved out of Washington, D.C. Headquarters were established in Chicago, Ill. Throughout the early part of the decade 1937–46, John Collier (who had been appointed by President Roosevelt in 1933) served as U.S. commissioner of Indian affairs. He resigned in 1945 and was succeeded by William A. Brophy of Albuquerque, N.M.

Industrial Health

Interest in the health and welfare of industrial workers made remarkable progress during the ten years 1937-46. Social legislation, the war years and a growing concern on the part of labour for the physical well-being of its membership, were the most conspicuous of many forces tending to elevate industrial health to a degree of eminence in medical thought and practice never before attained. Once concerned solely with the clinical management of disabilities arising out of employment in accordance with strict interpretation of the statutory requirements of workmen's compensation laws, industrial health and welfare drew heavily upon all the disciplines associated with medicine and hygiene proper, and made constantly increasing demands on the pure sciences, social science, engineering, law, psychology and business administration. During World War II particularly it became abundantly clear that the major productive resources of a nation were not solely materials or machines but healthy, vigorous manpower. Out of this concept, modern industrial medicine came to look for its principal inspiration.

Changing Scope and Content.—Industrial health began to assert itself as a specialty in medicine calling for a degree of preparation on the part of those electing to serve therein quite as exacting as any other field. It became clear that the true function of the industrial physicians lay in the direction of social medicine rather than remedial service, with the latter left preferably to private practitioners and consultants. Every substantial improvement in public health services during this period was in consequence attended by a commensurate elevation in the standards or application of industrial hygiene. Preventable industrial accidents and occupational disease were only minor contributors to the excessive amounts of lost time and wages in industry as compared to ordinary illness. Steps were taken therefore to bring industrial physicians, private practitioners and health administrators into closer alignment. A clearer understanding of industry as a convenient avenue for the administration of many health services brought the interdependence of these three groups into clearer perspective. Case-finding programs dealing with early discovery of tuberculosis, venereal disease and visual disorders became common and accepted practices. The trinity of physical well-being, mental health and satisfactory environment, variously described as psychosomatic medicine or the "total-man" approach, was recognized as having singular application to the work of industrial physicians who were intimately concerned with human health and behaviour in an industrial age and the necessity for maintaining healthful, pleasant and stimulating work conditions.

As an answer to these and other questions, industrial physicians began to inquire more closely into the techniques of positive health as opposed to the negative qualities of remedial and preventive medicine. This transfer of interest to the causes of health rather than the aetiology of disease was a fundamental change in point of view which gave promise of shaping much of the future course of industrial medicine.

Industrial Health and the War.—With the exception of a number of basic materials which were in short supply, the pre-eminent problem in the production of war material

was manpower. The enlistment or draft of the entire body of able-bodied men in the younger age classifications into the armed forces made it necessary to enhance the labour pool by great numbers of women, and by over-age and substandard workers. Medical directors in industry promptly learned that the physical examination standards enforced by recruitment and draft boards were largely inapplicable to industry, and that proper placement of both able-bodied and handicapped workers in suitable jobs was sufficient to maintain production at high levels. The health status of the millions of inexperienced women employed in war plants required special measures. The principal reasons for absence of women from work arose from causes associated with the home and family to a much greater extent than in the case of their male co-workers. Childbearing in particular called for special regulations regarding employment and medical supervision. Many thousands of handicapped of all types and degree were used in a wide variety of industrial operations. In general it was found that they were as productive as their able-bodied co-workers, were absent less, changed jobs infrequently and were less likely to sustain severe injury.

Armies and navies became huge employers of labour in the manufacture of munitions, ships, planes and all the other endless requirements of the fighting forces. Industrial health became an important function of the preventive medical divisions of these services. Industrial medical officers and hygienists were stationed at munitions plants, shipyards, air depots, arsenals, chemical warfare installations, in the service commands and naval districts and at ports of embarkation. Laboratories of industrial hygiene were maintained to seek out and control all sources of occupational exposure and risk. Aviation medicine came to identify itself closely with the whole field of industrial health in full recognition of the health requirements of production workers, ground crews and fliers.

The discovery and use of atomic energy as an implement of war and its unimaginable implications as a source of usable power called for prompt orientation respecting its predictable use in industry and medicine. The actual production of nuclear energy was accomplished with a healthy appreciation of the fantastic hazard. The successful adaptation of the techniques of industrial medicine and engineering to this new and deadly substance was remarkable and reassuring. From this point of view, there seemed to be no insuperable obstacle to the production of atomic energy, although it was not yet altogether clear how these titanic forces could be chained for safe use in industrial power plants or in transportation.

Social and Labour Legislation.—Social security legislation enacted in 1935 in the United States unquestionably exercised a profound influence upon the entire industrial health structure. In addition to old-age and unemployment benefits, these enactments provided for much broader support of the public health. Industrial health as an important segment of community and national well-being benefited commensurately. Funds became available through the U.S. public health service and were assigned to state health departments to subsidize new bureaus of industrial hygiene or to enlarge those already in existence. Under this enlightened approach, the original handful of laboratories and investigational services so multiplied that 39 states and a dozen cities provided some form of supervisory control over workers and working conditions. At the outset, surveys were made, and for the first time accurate estimates were compiled of the size and nature of the industrial health problem. During the same period the division of industrial hygiene in the U.S. public health

service proper notably expanded to encompass sections dealing with state relations, research and occupational dermatosis, effectuated in turn by medical, engineering and statistical units. The wisdom of this kind of organization was amply demonstrated in the war years.

In England the Factories act of 1937 served much the same role in vitalizing industrial health services. The provisions of the older factory and work shop laws were revised, consolidated and brought into harmony with public health laws and those governing workmen's compensation. The meaning of the term "factory" was considerably broadened to include small shops and occupations not previously involved, the effect of which was to extend protection to much greater numbers of workers. Special attention was directed at working hours by day and week, sanitary and hygienic working conditions, medical and nursing supervision, first aid and emergency services, overcrowding and the employment of women and minors, all assigned variously to the factory inspectorate or to the local authorities.

New and improved standards governing hours of work and wage levels were widely adopted, with consequent beneficial effect upon the welfare of the working population. A public contract act passed during World War II in the United States made it unlawful for firms engaged in interstate commerce to permit work in excess of 8 hours in any one day, or in excess of 40 hours in any one week, to employ minors or convict labour or to perform work under conditions determined to be unsafe or unhealthful by the state factory inspection services. To accomplish these purposes, the U.S. department of labour conducted special training courses for factory inspectors and set up regional and state administrative divisions.

Trends in workmen's compensation took the customary course of broader coverage and liberalization. The favourable trends in both severity and frequency of industrial accidents were interrupted by World War II, mainly because of the wartime hiring of inexperienced workers and the extraordinary pressure under which goods were produced. Statistics throughout the ten-year period indicated that occupational disease, although a serious problem in only a few dangerous trades, was on the increase, possibly because of better recognition and improved reporting. Dermatitis as in other years was responsible for most of the claims for compensation. During these years, the objectives of workmen's compensation were re-examined; changes in practical administration were made, many of which referred to standards of medical care, qualifications of physicians, medical participation in administrative practice, fee schedules and the like.

Since ordinary illness was so heavy a contributor to lost time in industry, the advantages of compulsory health insurance as an extension of the social security system or in the form of a national health act were widely debated in the United States and Great Britain. Labour and social workers were strong advocates. The medical profession for the most part was inclined to a conservative evolutionary approach, based on voluntary participation, local determination of needs and minimum governmental intervention. Industrial management as a rule supported this latter view.

Attitude of Management and Labour.—There was a strong tendency during World War II to promote joint labour-management co-operation respecting industrial health, safety and welfare. Traditionally industrial management had assumed responsibility for all medical serv-

ices, whether limited to treatment of occupational disability or whether they extended widely into prevention and to care of ordinary illness for the worker and his dependents. The turn of events in the decade 1937–46 suggested that labour was now thoroughly alive to the value of health as a factor in individual and collective security, and that health and welfare were destined to be prominent elements in all collective bargaining in the future. The National Bituminous Coal Wage agreement of 1946 in the United States was the most pronounced departure from conventional procedure. Under this plan, a medical care fund was created by pay roll deduction to be administered entirely by the workers. Welfare and retirement funds made up of imposts against production were adopted in several employment contracts.

Industrial health services were well supported by large plants where size or special nature of the work made a plant medical department a practical necessity. Several experiments indicated clearly that small plants could avail themselves of similar high-grade medical programs if they banded together for this purpose.

Rehabilitation.—Always a major concern of physicians in industry, rehabilitation took on added significance during World War II and in the early postwar years. Soldiering is an occupation, and those responsible for the conduct of military activity took elaborate pains to recondition the wounded and disabled, primarily to return them to duty or, if unfit for further service, to put them in the best possible position to assume a useful place in society. Elaborate medical and surgical establishments were created for the blind, the deaf, amputees and for the host of traumatic injuries characteristic of war. The policy of beginning the rehabilitation process at the earliest possible time was an invaluable factor in shortening the period of convalescence, minimizing the psychoneurotic component of injury and stimulating the will to recovery. Veterans' facilities began to assume these functions as the character of the total problem took shape. At the same time, rehabilitation of disabled civilians, who in point of numbers exceeded the veterans' problem manyfold and who represented a much greater collective burden to society, was very considerably expanded. Provisions were made to allow all eligible handicapped to receive medical care and essential vocational guidance, training and placement. All these developments were of concern to industry, since reemployment was the sole mark of successful rehabilitation. It was learned that almost every disabled person had some (and frequently great) residual ability; this was the important key to successful job assignment rather than cumbersome and unscientific percentage estimations of disability. Selective placement became one of the valuable tools of the industrial physician, the personnel manager and the shop supervisor through the successful and frequently brilliant matching of physical and mental capacities and job requirements.

Rehabilitation and reconditioning re-emphasized the great actual and often unrealized values in physical medicine and occupational therapy. In both England and the United States steps were taken to investigate new methods, adapt new concepts in biophysics and biochemistry to the restorative and healing processes and to provide for greatly expanded training facilities for physicians and technical aides. Particularly in the industrially disabled, there was a strong trend toward functional reconditioning under actual working conditions in addition to the conventional armamentarium of the occupational therapist.

Professional and Technical Advance.-The growing dependence of industry upon medicine and hygiene for essential services made it necessary to develop an awareness on the part of the medical profession at large of its obligations and opportunities in this field. Since every physician could expect to encounter industrial medical problems early in his career, medical schools began to introduce a much more substantial amount of essential teaching. The trend toward specialization was recognized in England, Canada and the United States, and the necessary experience and education needed for certification began to take form. Divisions of social medicine were set up in medical and public health schools in which industrial medicine was a substantial component. New medical journals dealing with occupational health were launched by both the British and American Medical associations.

Industrial hygiene reached its highest development thus far during World War II. The manufacture of munitions was conducted at astounding levels of safety and health. An extraordinary range of experimental and investigative activity occurred. The physiology of work was of particular interest. It was learned again that longer hours of work are not accompanied by commensurate increases in output, and that rest pauses are of definite practical value, especially in monotonous and repetitious work. Ventilation engineers and industrial hygienists perfected methods of air analysis and purification and of establishing control over temperature and humidity. Aviation medicine made great progress in the determination of risks associated with flight at high altitudes and designed methods to combat them. Special schools for flight surgeons were set up in the armed services to facilitate proper personnel selection, preventive measures and adequate treatment. A better understanding of resuscitation resulted from extensive research into pulmonary and cardiac function, the physical and pharmicologic action of gases and the improved use of mechanical aids to respiration. Wound care and healing were spectacularly improved as the result of the advances in chemotherapy and antibiotics. War injuries stimulated great advances in plastic surgery and the development of prosthetic appliances. Tropical disease became for the first time a measurable factor in industrial medicine in temperate zones, detected largely in veterans examined for employment or in others returning by rapid transportation from infested areas.

The real function of physical examination in industry for placement rather than exclusion was better understood by physicians, management and labour. Nutrition of the industrial worker was looked upon as of first importance in the maintenance of health and high productive capacity. Workers' wives were taught food values and proper preparation. Many factories developed in-plant food service. Sanitation and good housekeeping were attacked scientifically and brought into harmony with air and water purification, plant design and industrial waste disposal. The use of aluminum to prevent and treat silicosis showed considerable promise, but further clinical trial was still needed to assay results.

British Anti-Lewisite (BAL), a product of chemical warfare investigation intended as an antidote for arsenical blister-gases, was found to be effective against systemic arsenic poisoning. There were indications that mercury and other metal poisoning might be successfully attacked along similar lines. Industrial dentists increased in number and activity. The number of industrial nurses increased nearly threefold. Because of this rapid growth, special problems of preparation and experience presented themselves, and guides of conduct for the nurse and first aid worker in industry were prepared. Many new dermatitis producers were catalogued. Cutting-oil dermatitis was a gross offender, and the causes and means of prevention and care were developed. Psychiatry demonstrated genuine values to industry as a means of combating human maladjustment commonly manifested as absenteeism, rapid labour turnover, high rate of accident incidence and labour trouble. Toxicologists were concerned with many new and untested materials and processes as well as the old offenders. Some of the rarer metals, in particular, such as selenium, tellurium and beryllium came into wider use and were scrutinized for potential risks. The list of new solvents, plastics, coatings, cleaners, dyes, fungicides-in a word, the products of modern chemistry-were so voluminous as to make real knowledge of potential toxicity an impossibility. Chemical manufacturers, public health officers and medical authorities took steps to protect the fabricator and the consumer by a program of proper labelling and by popular and professional education.

The impact of the atom on industry and medicine, the increased emphasis placed on health as a factor in individual and collective security, the change in emphasis from treatment and prevention to positive health, the war and postwar preoccupation with rehabilitation and selective placement, together with great advances in industrial hygiene, industrial medicine and surgery—all underscored the expanding importance of medical service in an industrial age and gave shape and substance to likely developments in the future.
